ITRC instructors will present a two hour training to help participants understand how to use bioavailability to improve human health risk assessment and refine soil remediation requirements.

As a participant in this training you will learn to:

• determine when a bioavailability assessment may be appropriate
• understand factors that affect arsenic, lead and PAH bioavailability
• select appropriate methods to evaluate soil bioavailability
• use tools to develop soil bioavailability estimates and incorporate them into human health risk assessment.

Participants are invited to preview training materials at https://bcs-1.itrcweb.org

Participants interested in this 3rd May training are invited to register by sending an email to GSOP18@fao.org before the 20th March.

ITRC is a state-led non-profit organization administered by the Environmental Council of State whose mission is to achieve healthy and sustainable air, water, land, and ecology through the adoption of innovative solutions.
