Preparation of this document

These guidelines summarise a series of studies, funded by the UK Department For International Development (DFID, previously known as ODA) on the management of Asian floodplain river fisheries. Between 1992 and 1997, DFID has funded four separate projects in this area. The research was initiated by a project led by Bath University's Centre for Development Studies (CDS), entitled 'Poverty, Equity and Sustainability in the Management of Inland Capture Fisheries in South and South-East Asia'. The theme was then taken up by three projects, led by MRAG Ltd, and funded by DFID's Fisheries Management Science Programme (FMSP): 'River and Floodplain Fisheries in the Ganges'; 'Fisheries Dynamics of Modified Floodplains in Southern Asia'; and 'An Evaluation of Floodplain Stock Enhancement'.

The Technical Paper is written in two parts. Part 1 outlines a practical strategy for the management of large floodplain rivers based on the experiences gained by these projects and on other literature from related research. Part 2 includes the more technical data derived from the research projects, on which the guidelines in Part 1 are based. The Part 1 guidelines are presented in a simple and user-friendly style to provide both policy makers and field officers with the tools they need to manage river fisheries, and the technical and institutional background to make them work. The guidelines may also be used in the construction of courses for regional fisheries officers and related extension workers.

Funding for the preparation of this paper was provided by the UK Department For International Development. The Technical Paper was published through FAO to ensure the widest possible dissemination of its ideas. Over the years, the research theme has benefitted from the active participation of a wide range of local collaborators, including staff from: the Bangladesh Agricultural University (BAU), Mymensingh, Bangladesh; the Bangladesh Centre for Advanced Studies (BCAS), Dhaka, Bangladesh; the Bangladesh Institute for Development Studies (BIDS), Dhaka, Bangladesh; the Central Research Institute for Fisheries (CRIFI), Jakarta and Palembang, Indonesia; the Environmental Laboratory of the University of Patna, India; the Coastal Resources Institute (CORIN) of the Prince of Songkla University, Hat Yai, Thailand; the Zoology Department of the University of Allahabad, India; the Zoology Department of the University of Garhwal, India. The many contributions of these collaborators to the ideas in this paper are warmly acknowledged. Special thanks are due to CRIFI's Dr Fuad Cholikh, Dr Fatuchri Sukadi, Novenny Wahyudi, Dr Achmad Sarnita, Ondara, Agus Djoko Utomo and Zahri Nasution; to BAU's Dr M.A. Wahab; to MRAG's Prof. John Beddington and Kanailal Debnath; to CDS's Alex Kremer, Claire Hall, Dr Adrian Winnett and Prof. Chris Heady; to CORIN's Dr Somsak Boromthananat and Dr Awae Masae; to the University of Patna's Dr R. Sinha; to BCAS's Dr Saleemul Huq; to Proshika's Rashed un Nabi; to DFID's Dr John Tarbit, Neil McPherson and Chris Price; and to FAO's Dr Jim Kapetsky.

MRAG Ltd is a leading international consulting firm, specializing in aquatic resources management, development, research and assessment, and information technology. The group has extensive experience of working in marine, freshwater, riverine and floodplain environments, and has worked in more than 60 countries for governments, private sector companies and international agencies. MRAG was formed in 1984, currently has a core staff of more than 20 professionals from a range of disciplines, and is located in the Imperial College campus, in the University of London. The group is associated with, and covenants funds to, the Marine Education and Conservation Trust, a charity which supports research and education.

Management guidelines for Asian floodplain river fisheries. Part 2. Summary of DFID research. *FAO Fisheries Technical Paper*. No. 384/2. Rome, FAO. 1999. 117 p.

Abstract

This technical paper provides guidelines for an integrated management strategy for floodplain river fisheries. The paper is written in two separate volumes. Part 1 presents the guidelines in a 'user-friendly' format, to promote their uptake by fishery managers, policy makers and field officers. Recommendations are given both on the alternative technical tools which may be used to manage river fisheries, and on the institutional factors required for their success. The highly variable ecological and social characteristics of floodplain rivers demand locally-appropriate and adaptive solutions, rather than a single 'blueprint' approach. The recommended management strategy allocates responsibilities both hierarchically and spatially, and promotes the effective collaboration of government, communities and other stakeholders at appropriate levels.

The more technical Part 2 describes the underlying research work which provided the basis for these management guidelines. Investigations were made during four projects funded by the UK Department For International Development (DFID), in Bangladesh, India, Indonesia, Nepal and Thailand, between 1992 and 1997. Part 2 describes the floodplain river environments, the fish stocks and the fishing practices found at some of these study sites. Justification is given for a range of technical management tools for river fisheries, including the use of access controls and reserves, and the manipulation of water levels within flood control and irrigation schemes to give benefits to fishing as well as agriculture. Final chapters in Part 2 describe lessons learnt on the management of enhancement fisheries (e.g. based on fish stocking), and on the prospects and limitations of participatory management for these resources.

Preface	1
1 Introduction	3
1.1 DFID Natural Resources Research	3
1.2 DFID's 1992-97 Asian River Research Projects	3
1.2.1 Project R4791 - Poverty, Equity and Sustainability....	4
1.2.2 Project R5485 - The Ganges Basin	4
1.2.3 Project R5953 - Fisheries Dynamics of Modified Floodplains....	4
1.2.4 Project R6494 - Evaluation of Floodplain Stock Enhancement	5
1.3 The Future Research Programme	6
2 The Floodplain Environment	7
2.1 River Catchments and Habitats	7
2.1.1 River habitats	7
2.1.2 The 'flood pulse' concept	8
2.1.3 Spatial variability of river systems	8
2.1.4 Dry season waterbodies	13
2.2 Flood Variability	15
2.2.1 Seasonal (within-year) variability	15
2.2.2 Between-year variability	15
2.3 Hydrological Modification of Floodplain Rivers	18
2.3.1 Types of floodplain modification	18
2.3.2 The Pabna Irrigation and Rural Development Project (PIRDP)	19
3 Floodplain River Fish	24
3.1 Introduction	24
3.2 Characteristics of Floodplain River Fish	24
3.2.1 Migration patterns - blackfish and whitefish	24
3.2.2 Habitat preferences	27
3.2.3 Growth rates	29
3.2.4 Reproduction	32
3.2.5 Mortality and survival	34
3.3 Impact of Fishing on Fish Stocks	44
3.3.1 Impact of fishing on total catches	44
3.3.2 Impact of fishing on species composition of catches	45
3.4 Impact of Floodplain Modification on Fish Stocks	47
3.4.1 Impact of floodplain modification on <i>potential</i> fish productivity	47
3.4.2 Accessibility of modified floodplains to migrant fish	49
3.4.3 Impact of floodplain modification on fish species compositions	53
3.4.4 Overall impact of floodplain modification on fish catches	55
4 Floodplain Fisheries	57
4.1 Floodplain Fishing Gears	57
4.1.1 Categories of floodplain fishing gears	57
4.1.2 Dependence of fishing gear use on local conditions	58
4.1.3 Mesh sizes of floodplain fishing gears	58
4.1.4 Barrier gears	61
4.1.5 Chasing gears	62
4.1.6 Set-and-wait gears	63
4.1.7 Hoovering gears	64
4.2 Seasonality of Fishing and Effectiveness of Gears	65
4.2.1 Seasonality of fishing	65
4.2.2 Dependence of gear seasonality on local conditions	66
4.2.3 Seasonal variation in gear effectiveness (catchability)	68

5	Technical Management of Floodplain Fisheries	70
5.1	Managing Access to Fishing	71
5.1.1	<i>Jalkar</i> licensing system - Bangladesh	71
5.1.2	Regional waterbody licensing systems in South Sumatra, Indonesia	73
5.1.3	Community-based access-management in Jambi, Indonesia	73
5.1.4	Access to fishing and the mobility of fishers	74
5.1.5	Implications of licensing for sustainability	74
5.1.6	Comparison of licensing systems	76
5.2	Managing Interactive Multi-Gear Fisheries	76
5.2.1	Technical interactions between gears	77
5.2.2	'BEAM4' modeling of the effects of alternative management strategies	77
5.2.3	Sensitivity of BEAM4 management recommendations	80
5.2.4	Simple alternatives to BEAM4	82
5.3	Use of Reserves for Floodplain Fisheries	83
5.3.1	Year-round reserves	83
5.3.2	Dry season reserves	83
5.3.3	Numbers of dry season reserves	84
5.3.4	Locations of dry season reserves	84
5.4	Managing Modified Floodplain Fisheries	84
5.4.1	Implications of fish migrations	85
5.4.2	Management of sluice gates	85
5.4.3	Hydrological manipulation	85

List of Tables

Table 1.1	Study sites of the four DFID Asian River fishery research projects	5
Table 1.2	Research collaborators of the four DFID research projects	6
Table 2.1	Habitat types found at the Bangladesh and Indonesia study sites	7
Table 2.2	Relative sizes and water retention of five categories of dry season waterbodies, inside and outside the PIRDP flood control, drainage and irrigation scheme, NW Bangladesh (after Hoggarth <i>et al</i> , in press (b))	14
Table 2.3	Comparative flood indices inside and outside the PIRDP's Talimnagar and Baulikhola sluice gates in 1995 and 1996 (from MRAG, 1997).	22
Table 3.1	Estimated mean lengths at maturity (L_{m50} , in cm, with sample sizes in parenthesis) for key fish species at the PIRDP study site (from Halls <i>et al</i> , in press (a)).	34
Table 3.2	Estimates of mean total mortality rate z for key species inside and outside the Bangladesh PIRDP study site, with probability (p) of no difference between the two regions. Due to the absence of significant ($p > 0.05$) differences in mortality rates between regions, estimates of Z from both locations are pooled to give an overall and equivalent mean survival rates S (%), with 95% confidence intervals. Numbers in parentheses give sample sizes (from Halls <i>et al</i> , in press (a))	38
Table 3.3	Tag recapture rates for anchor-tagged key species in Bangladesh and Indonesia (project R5953, from MRAG, 1997 and Halls <i>et al</i> , in press (b)).	40
Table 3.4	Estimated escapement (kg/ha) of fish at the end of the dry season, inside and outside the PIRDP flood control scheme (from Hoggarth <i>et al</i> , in press (b)).	42
Table 3.5	Total numbers of fish species recorded in catches from dry season waterbodies in the early (November to March) and late (April and May) dry season, inside and outside the PIRDP flood control scheme, by waterbody type ('-' indicates zero catches or missing species composition data; from Hoggarth <i>et al</i> , in press (b)).	43
Table 3.6	Percentages of tagged fish recaptured in different habitat regions at the Indonesian River Lempuing study site, suggesting variations in fishing mortality between habitats (project R5953; summarised from MRAG, 1997).	43
Table 3.7	Comparison of fishing and catch rates at the R5953 Bangladesh and Indonesian study sites (summarised from MRAG, 1997)	44
Table 3.8	Summary table indicating where the growth performance measures and explanatory variables were found to be significantly greater in relation to the sampling location and hydrological year (NS = no significant difference; Halls <i>et al</i> , in press (a)).	48
Table 3.9	Seasonal fish migration phases at the PIRDP's Talimnagar and Baulikhola sluice gates during the 1996 flood season, summarising catch data in Figure 3.12 (from Hoggarth <i>et al</i> , in press (b)).	50
Table 3.10	Total catches (kg) at the Baulikhola and Talimnagar sluice gates, subdivided by migration phase and gear type (from Hoggarth <i>et al</i> , in press (b)).	52
Table 3.11	Numbers of tagged fish released and recaptured, by species, and the numbers which penetrated the PIRDP sluice gates, during 1995/96 (from Halls <i>et al</i> , in press (b)).	52
Table 3.12	Estimated total annual productivity ($\text{kg ha}^{-1}\text{y}^{-1}$) inside and outside the PIRDP (from MRAG, 1997).	55
Table 4.1	Descriptions of the fishing gears used at the Bangladesh PIRDP study site, with their positions fished and mesh sizes (after MRAG, 1997)	59
Table 4.2	Descriptions of the fishing gears used at the Indonesian River Lempuing study site, with their positions fished and mesh sizes (after MRAG, 1997)	60
Table 4.3	Estimated relative catches from different gear categories from the Bangladesh PIRDP and Indonesian River Lempuing sites (after MRAG, 1997)	61
Table 6.1	Objectives of the eight projects reviewed by Project R6494 - An evaluation of Floodplain Stock Enhancement	89
Table 7.1	Prospects for management compliance under different types of community structure and authority	110
Table 7.2	The importance of spatial characteristics of inland fisheries for their prospects for participatory management	113

List of Figures

Figure 2.1	Map of the Hail Haor study site in NE Bangladesh (Project R4791; from MRAG, 1994)	10
Figure 2.2	Map of the PIRDP study site in NW Bangladesh (Project R5953; from Halls <i>et al</i> , in press (b))	11
Figure 2.3	Map of the River Lempuing and Jambi study sites in Sumatra, Indonesia (Projects R4791 and R5953; from Hoggarth <i>et al</i> , in press (a))	12
Figure 2.4	Time series of the monthly mean water levels at the Lubuk Lampam CRIFI field station gauge on the Lempuing River (Project R4791, gauge broken from January to September, 1992; from MRAG, 1994)	16
Figure 2.5	Maximum and minimum mean monthly water levels (open bars) and average flood season (January -April) and dry season (July-September) water levels (black bars) on the Lempuing River in years 1975 to 1993 (Project R4791, data not available for 1992 and dry season 1993, from Hoggarth and Utomo, 1994)	17
Figure 2.6	Area inundated by flooding in Bangladesh, 1954-1988 (from Halls, 1998, redrawn from Ahmad, 1989)	17
Figure 2.7	Map of the Pabna Irrigation and Rural Development Project (PIRDP) in NW Bangladesh (from SWMC, 1994). The R5953 study site straddled the embankment in the SE of the PIRDP (compare with Figure 2.2).	20
Figure 2.8	Daily water heights measured inside (thick lines) and outside (thin lines) the PIRDP Talimnagar and Baulikhola sluice gates, and daily sluice gate apertures in 1995 and '96 (from Hoggarth <i>et al</i> , in press (b)).	22
Figure 3.1	Percentages of tagged fish of each key species, released in each month, and subsequently recaptured in either the same or the next calendar month in a different location. Figures above bars indicate the total numbers of tagged fish recaptured within the same or the next calendar month as release (from Halls <i>et al</i> , in press (b)).	27
Figure 3.2	Recaptures of tagged fish of each key species at the Bangladeshi PIRDP study site. Lines with arrows connect the release and recapture locations of migrating fish; bold lines show fish which crossed the PIRDP embankment. Circles indicate fish recaptured at their release locations, with \emptyset = number of fish indicated by the largest circle in each plot. n = total number of tag recaptures. Squares indicate the positions of the PIRDP sluice gates (see Figure 2.2) (from Halls <i>et al</i> , in press(b))	28
Figure 3.3	Percentages of tagged key fish species in Bangladesh, migrating at least the specified distances from their release locations (from Halls <i>et al</i> , in press (b)).	29
Figure 3.4	Recaptures of tagged fish of each key species at the Indonesian River Lempuing study site. Lines with arrows connect the release and recapture locations of migrating fish. Circles indicate fish recaptured at their release locations, with \emptyset = number of fish indicated by the largest circle in each plot. n = total number of tag recaptures (from MRAG, 1994).	30
Figure 3.5	Percentages of tagged fish of each key species at the PIRDP study site, recaptured in each month, in river/canal habitats (dark grey bars), floodplain habitats (light grey bars, including dry season pools), and 'beel' lake habitats (black bars). Figures above bars indicate the total number of recaptures (from Halls <i>et al</i> , in press (b)).	31
Figure 3.6	Bi-monthly fork length frequencies of <i>Wallago attu</i> , combined across non-selective gear types, in the Inside ('modified') and Outside regions of the PIRDP study site. X-scale = 0-127cm in 1cm classes (from Halls <i>et al</i> , in press (a)).	33
Figure 3.7	Fraction of mature male and female fish of each key species plotted against their lengths. Solid circles and solid lines, and open circles and broken lines indicate data and corresponding logistic model fits, for fish sampled from inside and outside the PIRDP, respectively (from Halls <i>et al</i> , in press (a)).	35
Figure 3.8	Changes in the mean monthly gonado-somatic index (GSI) with 95% confidence intervals for sampled female <i>A. testudineus</i> , <i>C. striatus</i> , <i>G. giuris</i> , <i>P. sophore</i> and <i>W. attu</i>	

	from inside (solid line) and outside (broken line) the PIRDP during the 24 month sampling period (January 1995 to December 1996). Where no confidence interval is shown, only one fish was sampled. The top plot shows the changes in mean monthly water height (ft) inside (solid line) and outside (broken line) the PIRDP at Talimnagar sluice (from Halls <i>et al</i> , in press (a)).	36
Figure 3.9	Bimonthly fork length frequencies of the catfish <i>Mystus nemurus</i> , combined across non-selective gear types at the River Lempuing study site, with an approximate growth curve fitted 'by eye' (X-axis scale = 0-55cm; from MRAG, 1997).	39
Figure 3.10	Estimated total catches scaled by high water floodplain area, plotted against fisherman densities for the three study sites and other tropical floodplain fisheries in Asia, Africa and South America (from Hoggarth and Kirkwood, 1996).	45
Figure 3.11	Between site comparisons of the relative catches and mesh sizes of the most important gear types, and the catches of fish species with maximum lengths in three different size classes (from Hoggarth and Kirkwood, 1996).	46
Figure 3.12	Total daily catches (kg) of inwardly migrating fish (thin lines) and outwardly migrating fish (thick lines), by the three interceptory gear types at the PIRDP's Baulikhola and Talimnagar sluice gates during the 1996 flood season. Lower right graph shows daily water heights and periods of sluice gate opening, for comparison (data missing in mid-October; from Hoggarth <i>et al</i> , in press (b)).	51
Figure 3.13	MDS ordinations comparing species assemblages inside (black symbols) and outside (open symbols) FCDI schemes in three habitats and four regions in Bangladesh (from Halls <i>et al</i> , in press (b)).	53
Figure 3.14	Average abundance (seine net CPUE) of species sampled from inside (solid bars) and outside (open bars) FCDI schemes in the NW region. Species are arranged from top to bottom in descending order of their contribution to the average dissimilarity between the two groups of sites (from Halls <i>et al</i> , in press (b)).	54
Figure 3.15	Total monthly catches (t) in the four study regions of the PIRDP site in 1995 and '96 (from Hoggarth <i>et al</i> , in press (b)).	56
Figure 4.1	Between site comparisons of the seasonality of water levels and fish catches from selected, important gear types (from Hoggarth and Kirkwood, 1996).	66
Figure 4.2	Average monthly catches (left) and total annual catches (right) in years 1986-92, from the six main river gears at the Lubuk Lampam auction unit on the River Lempuing (1988 catch data not available by gears; from Hoggarth and Utomo, 1994).	67
Figure 4.3	Subsampled daily fish catches (up to six days of data per month) of <i>kilung</i> floodplain/lake barrier traps and <i>tuguk/corong</i> riverine barrier traps during 1995 at different locations in the River Lempuing, Indonesia. Lake Danau Besar is larger and further from the main river than Lake Lebung Sulit; the forest river region is upstream of the savanna river region. (after MRAG, 1997).	68
Figure 4.4	Percentages of tagged fish of each key species, released in each month, and subsequently recaptured in either the same or the next calendar month at the Bangladesh PIRDP study site. Figures above bars indicate the total numbers of tagged fish released (from Halls <i>et al</i> , in press (b)).	69
Figure 5.1	Locations of the fourteen licensed ' <i>jalkar</i> ' waterbodies at the Bangladesh PIRDP study site, licensed for access to fishing by the Bangladesh Government's Ministry of Land (from MRAG, 1997).	72
Figure 5.2	Estimated monthly catches (tonnes) during 1995, taken in the four capture regions by fishermen from the three residence regions, at the Bangladesh PIRDP study site (from MRAG, 1997).	75
Figure 5.3	Length frequencies of <i>Notopterus notopterus</i> (left) and <i>Helostoma temminckii</i> (right), taken from six different commercial gear types during four sampling periods, in 1993, from the River Lempuing in Indonesia (length scale from 1 to 35cm; TrapBR = combined bamboo and rattan traps, R&L = single hooks fished on rod and lines, Ngk Pg = <i>ngesek pinggiran</i> - see gear descriptions in Table 4.2; from Hoggarth and Utomo, 1994).	78

Figure 5.4	Comparison of the total catches of five fish species guilds by the ten most important gear types at the River Lempuing study site (see Section 4.1 and Table 4.2 for gear descriptions; from Hoggarth and Kirkwood, 1996).	79
Figure 5.5	BEAM4 predictions on the % changes in the catches of different gear types caused by the four management scenarios (symbols, as denoted in legends) at the three R4791 study sites (from Hoggarth, 1994).	81
Figure 5.6	Sensitivity of the BEAM4 model predictions for the Lempuing fishery, as indicated by the % changes to the catches of each gear type in the base model (bars), and with four altered inputs (symbols, as denoted in legends, with M = natural mortality, L50 = length at 50% selectivity, C = observed catch; from Hoggarth, 1994).	82
Figure 5.7	Schematic representation of the PPFMODEL showing the process by which the biomass in week w becomes the biomass in the following week w+1. The weekly process is repeated for the 52 weeks of the year, after which recruitment is added in week 52. The process is then repeated iteratively over several years until equilibrium is reached. Solid lines indicate direct influences or operations and broken lines indicate indirect influences or occasional operations (adapted from Welcomme and Hagborg 1977).	86
Figure 5.8	Contour plots of equilibrium yield (t) for <i>P. sophore</i> at the PIRDP generated by the PPFMODEL for different combinations of mean flood and dry season water height and for a range of fishing mortality, F rates (a) F = 0.2; (b) F = 1; (c) F = 2; (d) F = 3. (from Halls 1998).	86
