Georgia

Country Report Supporting the Preparation of the
First Report on *The State of the World's Aquatic
Genetic Resources for Food and Agriculture*

This Country Report has been submitted by the national authorities as a contribution to the Food and Agriculture Organization of the United Nations (FAO) publication, *The State of the World's Aquatic Genetic Resources for Food and Agriculture*. The information in this Country Report has not been verified by FAO, and its content is entirely the responsibility of the entity preparing the Country Report, and does not necessarily represent the views of FAO, or its Members. The designations employed and the presentation of material do not imply the expression of any opinion whatsoever on the part of FAO concerning legal or development status of any country, territory, city or area or of its authorities or concerning the delimitation of its frontiers or boundaries. The mention of specific companies or products of manufacturers, whether or not these have been patented, does not imply that these have been endorsed or recommended by FAO in preference to others of a similar nature that are not mentioned.

INSTRUCTIONS FOR COMPLETING THE DYNAMIC GUIDELINES

How do I complete the dynamic guidelines?

1. You will require Adobe Reader to open the dynamic guidelines. Adobe Reader can be downloaded free of charge from: <http://get.adobe.com/uk/reader/otherversions/>. Use Adobe Reader Version 10 or higher.
2. Open the dynamic guidelines and save it (save as a pdf) on your hard drive.
3. Please rename it <name of your country>.pdf.
4. You may forward the dynamic guidelines to stakeholders you would like to involve or inform by e-mail. You may also print and/or save the dynamic guidelines.
5. It is advisable to prepare textual responses (including any formatting such as bullet points) first in a separate document and then to copy and paste them into the form. Please use font Arial 10. Acronyms and abbreviations should be avoided if possible. If included, they must be introduced (i.e. written out in full) the first time they are used. Note that the text boxes are expandable. Once text has been entered, the box will automatically enlarge to make its content fully visible when you click outside its border. To delete a row you have added, click on the "X" on the far right of the table
6. When you have finished completing the dynamic guidelines, click the "Submit form" button at the end of the form and send the completed dynamic guidelines to Devin.Bartely@fao.org; Matthias.Halwart@fao.org; and ruth.garciagomez@fao.org.
7. This should automatically attach the document to an email that you can then send. Otherwise, please attach the completed dynamic guidelines manually to an e-mail and send it to Devin.Bartely@fao.org; Matthias.Halwart@fao.org; and ruth.garciagomez@fao.org.
8. A letter confirming official endorsement by relevant authorities should also be attached to the email.
9. You will receive a confirmation that the submission was successful.

Where can I get further assistance?

If you have any questions regarding the dynamic guidelines, please contact Devin.Bartely@fao.org; Matthias.Halwart@fao.org; ruth.garciagomez@fao.org

Several websites provide useful information on aquatic species that can be consulted for proper species names and for information on aquatic genetic resources: [AlgaeBase](http://www.algaebase.org), [Aquamaps](http://www.aquamaps.org), [Barcode of Life](http://www.barcodeoflife.org), [Census of Marine Life](http://www.censusofmarinelife.org), [FishBase](http://www.fishbase.org), [Frozen Ark](http://www.frozenark.org), [GenBank](http://www.genbank.org), [Global Biodiversity Information Facility](http://www.gbif.org), [International Union for Conservation of Nature](http://www.iucn.org), [National Institutes of Health Database on Genomes and Bioinformatics](http://www.nih.gov), [Ornamental Fish International](http://www.sealifebase.org), [SealifeBase](http://www.sealifebase.org), [Sea Around Us](http://www.searoundsus.org), and [World Register of Marine Species](http://www.marinespecies.org).

How, by whom and by when must the completed dynamic guidelines be submitted?

Once officially endorsed by the relevant authorities, the completed dynamic guidelines should be submitted (click the "Submit form" button on the header banner) by the National Focal Point. **Completed dynamic guidelines should be sent by December 31st 2015.**

I. INTRODUCTION

At its Thirteenth Regular Session, the Commission noted that the preparation of a country-driven *State of the World's Aquatic Genetic Resources for Food and Agriculture* would provide countries with opportunities for assessing the status of their aquatic genetic resources for food and agriculture and enhancing the contributions of aquatic genetic resources to food security and rural development. Additionally the process of producing Country Reports will assist countries in determining their needs and priorities for the conservation and sustainable use of aquatic genetic resources for food and agriculture, and will help raise awareness among policy-makers.

II. COUNTRY REPORTS

As with the other sectors, *The State of the World's Aquatic Genetic Resources for Food and Agriculture (SoWAqGR)* will be compiled from Country Reports. It is recognized that guidance is necessary in order to assist countries in completing those reports under a common framework. The Country Reports will become official government documents submitted to FAO.

The following questionnaire is the suggested format for the preparation and submission of Country Reports. The questionnaire has been prepared by FAO to assist in the preparation of Country Reports contributing to the SoWAqGR Report. It has been designed to assist countries to undertake a strategic assessment of their aquatic genetic resources for food and agriculture.

The scope of the first State of the World's Aquatic Genetic Resources for Food and Agriculture, and therefore the emphasis in the Country Reports, is farmed aquatic species and their wild relatives within national jurisdiction.

Country Reports should:

- become powerful tools for improving the conservation, sustainable use and development of aquatic genetic resources for food and agriculture, at national and regional levels;
- identify threats to aquatic genetic resources, gaps in information about aquatic genetic resources and needs for the strengthening of national capacity to manage aquatic genetic resources effectively;
- inform the development of national policies, legislation, research and development, education, training and extension concerning the conservation, sustainable use and development of aquatic genetic resources for food and agriculture;
- contribute to raising public awareness about the importance of aquatic genetic resources for food and agriculture;
- complement other national reporting activities on the conservation, sustainable use and development of aquatic genetic resources.

Timeline and process

In line with the overall process, as established by the Commission, the Director-General of FAO sent a Circular State Letter on 19 April 2012 to countries requesting them to identify National Focal Points for the preparation of Country Reports by 31 December, 2015.

The following steps are recommended in preparing the Country Report, using a participatory approach:

- Each participating country should appoint a National Focal Point for the coordination of the preparation of the Country Report who will also act as focal point to FAO. National Focal Points should be communicated to the Secretary, Commission on Genetic Resources for Food and Agriculture (cgrfa@fao.org) immediately.
- Countries are encouraged to establish a national committee to oversee the preparation of the Country Report. The national committee should consist of as many representative stakeholders as practical (representing government, industry, research and civil society).
- The national committee should meet frequently to review progress and consult widely with key stakeholders.

- The National Focal Point should coordinate the preparation of the first draft of the Country Report, which should be reviewed by the national committee. The National Focal Point should facilitate a consultative process for broader stakeholder review.
- Following the stakeholder review, the National Focal Point should coordinate the finalization of the Country Report, submit it to the government for official endorsement and transmit it to FAO in one of the Organization's official languages (Arabic, Chinese, English, French, Russian and Spanish) by 31 December 2015.
- The Country Report will be an official government report.
- If countries are unable to submit final Country Reports by the set deadline, preliminary reports of findings should be provided to FAO to contribute to the identification of global priorities for inclusion in the SoWAqGR Report.

AND AGRICULTURE**

Country report supporting the preparation of
The State of the World's Aquatic Genetic Resources for Food and Agriculture

Country	Georgia
Prepared By	Archil Phartsvania
Date	Aug 17, 2016

TABLE OF CONTENTS

	Page
I.EXECUTIVE SUMMARY	6
II.INTRODUCTION	7
III.MAIN BODY OF THE COUNTRY REPORT	8
Chapter 1. The Use and Exchange of Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction	8
Chapter 2. Drivers and Trends in Aquaculture: Consequences for Aquatic Genetic Resources within National Jurisdiction	39
Chapter 3. <i>In Situ</i> Conservation of Aquatic Genetic Resources of Farmed Aquatic Species and their wild Relatives within National Jurisdiction	47
Chapter 4. <i>Ex Situ</i> Conservation of Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction	53
Chapter 5. Stakeholders with Interests in Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction	57
Chapter 6. National Policies and Legislation for Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction	64
Chapter 7. Research, Education, Training and Extension on Aquatic Genetic Resources within National Jurisdiction: Coordination, Networking and Information	73
Chapter 8. International Collaboration on Aquatic Genetic Resources of Farmed Aquatic Species and Their Wild Relatives	82

I. EXECUTIVE SUMMARY

The Country Report should contain an executive summary of 2-3 pages highlighting the main findings of the analysis and providing an overview of key issues, constraints and existing capacity to address the issues and challenges. The executive summary should indicate trends and driving forces and present an overview of the proposed strategic directions for future actions aimed at the national, regional and global levels.

Please include the Executive Summary here.

The two vital challenges facing humanity in the XXI century. The first - to provide an ever-growing world population with food, "food security" of each country. The second - the conservation of biodiversity of our planet, that is necessary to maintain a steady state of the biosphere.

The problem of preservation of gene pools of agricultural species of domesticated animals is though private, but very important problem.

Aggro biodiversity includes all components of biological diversity of relevance to food production and agriculture, as well to the functioning of agro-ecosystems.

The breed are the main unit of the conservation of agro-biodiversity and the basis of bio-organic farming, as well for traditional and industrial agriculture. Due the breeds or combinations thereof get raw materials for the production of both industrial and organic food. The breeds closely associated with culture of the population of country, with development of agro and gastro tourism, agro-education.

Conservation and efficient management of national breeds of farm animals provides a solution to fundamental problems of food security and development domestic breeding. Availability of the breeds and intra-breed diversity in a gene pool of domestic or agricultural animals - the key to sustainable development of livestock, agricultural and food market of individual regions and the country as a whole. In its turn, high-quality food is the basis of the population's health.

The present country report summarizes the status of aquatic genetic resources in Georgia within the frame of the preparation of "The State of the World's Aquatic Genetic Resources for Food and Agriculture".

While the potential of aquaculture development in Georgia is well-known for many international experts, yet the per capita consumption of fish and seafood in Georgia remains is very low (aprox. 7.8 kg). And even in such a situation, the share of imported into the country of fish and fish products composes about 83% of the total consumed of the product.

In view of the consumer preferences, Georgian fisheries and aquaculture are focused on finfish. Accordingly, this report also deals only with finfish species.

Fisheries and aquaculture resources of Georgia could support a much higher fish production than the actual one. Fish production results of the distant and near past also indicate that there are huge potentials for quantitative and qualitative development of fish production in Georgia

Georgian fisheries laws and regulations applicable for inland waters are good and supportive. Still better enforcement of the observance of closed seasons, protection and maintenance of spawning conditions in general and spawning grounds in particulars, as well as the effective quantitative and qualitative monitoring of catches would considerably improve inland fisheries' development.

In most of the natural and manmade inland water-bodies the owners and leaseholders proclaim to practice culture based fisheries.

Development potentials in aquaculture depend on the fish species and practised culture systems. Tank and cage cultures of trout and sturgeon, provided that reliable sources and easy purchase of good quality fingerling and commercial feeds are available, could be developed in Georgia at least up to the production level of self-sufficiency of the country. This would be three to four times higher than the current level of annual production. Available water resources could also support the production estimated above.

Fish hatchery operations have a distinct role among the fish culture activities because both culture based fishery and any of the fish production systems depend basically on them. When the production of the fish hatcheries decreases or even stops the entire sector of inland fisheries and aquaculture declines which is the case diagnosed in Georgia. Hence, the entire fisheries and fish production of approximately 45 000 ha of inland waters and at least 7000 ha of fish ponds depends on the success of hatchery operations.

Most of the fingerlings used by aquaculturists are produced in Georgia. Some aquaculturists are self-supporting with regard to fingerling production, while others have to purchase their fingerlings in nearby hatcheries.

Approximately 70 percent of the trout eggs, fry and fingerlings for trout farms are produced in Georgia while the remainder is imported. The fingerlings of carp, trout and other species produced domestically are generally considered to be of poor quality. The absence of research programmes for genetic improvement, fish health management and fish feeding is considered to be one of the main reasons.

All said indicates the importance of genetic resources management.

II. INTRODUCTION

The main objective of the Introduction is to present an overview that will allow a person who is unfamiliar with the country to appreciate the context for the Country Report. The Introduction should present a broad overview and present background information from your country on farmed aquatic species, their wild relatives and culture based fisheries. Detailed information should be provided in the main body of the Country Report. Countries may wish to consider developing their Introductions after completing the main body of their Country Reports.

Please write the overview here

Georgia is situated in the central and western parts of the Caucasus surrounded by Armenia, Azerbaijan, Russia and Turkey (lengths of border lines are 164 km, 322 km, 723 km and 252 km respectively). The coastline of Georgia to the Black Sea is 310 km long, while maritime claims are in accordance with the United Nations Convention on the Law of the Sea (UNCLOS), namely 12 nm territorial sea and 200 nm exclusive economic zones (EEZ).

The large natural river supply of phosphorus and nitrogen, the essential nutrients for marine plants and algae has always made the Black Sea very fertile. The narrow continental shelf and the unique quality of the water of the Black Sea at Georgia provide fertile environment for pelagic fish species. Due to stable vertical stratification of the Black Sea water, the high hydrosulphide concentration causes scarcity of 5 demersal fish species. The total Georgian territorial sea area is about 6 900 km², while the area of its EEZ is about 115 000 km².

Georgia is rich in inland water resources. The yearly average precipitation is about 1 260 mm varying between 1 100 and 1 700 mm per year. This produced on an average 71.5 km³ water resources annually between 1961 and 1990. The total renewable water resources (TRWR) come to about 58.1 km³ per year.

Out of it 17.2 km³ per year groundwater and 56.9 km³ per year surface water are produced internally with a 16 km³ of overlap.

The country is divided into two main river basin systems. The Black Sea river basin system is located in the western area of the country. The total renewable surface water resources (RSWR) generated in this basin is about 42.5 km³ per year. The Caspian Sea river basin system is in the east side of the country, producing about 14.4 km³ annual RSWR.

According to different data sources there are about 25 000–26 000 rivers and streams in Georgia. It is believed that their total length may be as much as 54 000–59 000 km. However, only approximately 5 percent (1 250–1 300) of the rivers and streams are longer than 10 km. Because of the large number of water flows most of them have no name and can hardly be found in official lists.

Before independence only the bigger lakes, their total surface area of 8 800 ha were considered important for inland fisheries. Nevertheless, there are country summaries which mention about 860 lakes with a total area of almost 16 900 ha. All relevant documents agree that the total area of the most important 12 water reservoirs is around 10 700 ha.

Georgia is rich in ground water resources. The quality of the ground waters varies from pure freshwater to mineral and thermal waters.

The total capacity of fresh ground water resources is 560 m³ per second, out of which only about 18 percent (100 m³ per sec) is presently used. Over 80 percent of the geothermal resources are found in west Georgia. The capacity of thermal water resources are estimated varying between 960 000 and 1 000 000 m³/day (11–11.5 m³/sec). The temperature of these waters ranges between 30 °C and 108 °C. Out of the mentioned estimated quantity only one-third (about 329 500 m³/day) is actually used.

Various data are available about the marine fish species in Georgia. According to FishBase there are 48 species, while national specialists list 75 species living in Georgian waters of the Black Sea. Interestingly enough, there are only 16 species that are included in both of the registers.

The most important species of Black Sea fishes are anchovy (3 species), sprats (2 species), whiting, spiny dogfish, scads, pickerel, red mullet and mullet.

The inland waters of Georgia are rich in fish species. Surveys conducted in some of the main inland waters prove that many different species occupy many different ecological niches of the rivers.

According to the FishBase, there are 76 freshwater fish species, while national specialists list less, only 68, species living in Georgian inland waters. Out of them 26 species are mentioned by both sources of information.

Without doubt, the most internationally and locally valued freshwater fish species are the sturgeons. Out of the listed seven sturgeons five are considered endangered (*Acipenser guldenstaedtii* Colchicus, *Acipenser nudiventris*, *Acipenser stellatus*, *Acipenser sturio* and *Huso huso*).

The next group of highly valued fish species is the salmonids which also includes the Black Sea salmon (*Salmo labrax* or *Salmo trutta labrax*) and some local and introduced species.

Although cyprinids, such as common carp, Chinese major carps (grass, silver and bighead carps) and khramuli (*Varicorhinus capoeta*) are less valued than the salmonids, still they are the species that could provide the major part of fish catches in most of the Georgian inland waters and fish ponds. Out of them khramuli is an important native species of the region. The role of this fish among the cyprinids could be increased because of its food spectrum and feeding habit.

The most important freshwater predator fish species in Georgia are the European catfish (*Silurus oxglanis*), pikeperch (*Stizostedion lucioperca*) and pike (*Esox lucius*). They are not only highly valued species, but also important constituents of fish stocks in natural waters and in the polyculture of fish farms.

here are about 735 fish farms operating in Georgia. Among them 440 were pond farms and 295 were trout farms with

concrete basins.

The total area of fish ponds in Georgia is 7790 ha. The operating fishpond area in 2015 was more 3,000 hectares. The total area of concrete basins in Georgia is 342525 square meters. The operating basins area in 2015 was more 225 000 square meters.

The volume produced in the pond farms in 2015 amounted to 3980 tons. In the basin farms the volume of produced was 1650 tonnes.

On the pond farms the main targets of cultivation were Carp, Silver and Bighead carp, grass carp, as well as additional fish, such as in western Georgia is Pike and in eastern Georgia the European catfish. For the basin-farms the main object of cultivation was rainbow trout.

In addition to these fish species in 2015 in Georgia were cultivated some sturgeon and salmonid species, as well African catfish in small quantity.

III. MAIN BODY OF THE COUNTRY REPORT

Aquaculture, culture-based fisheries and capture fisheries, have differing importance among countries. The structure of chapters in each Country Report will reflect those differences. Countries which do not have a well-developed aquaculture sector but where wild relatives of farmed aquatic species are located, should report on these resources. Countries should decide how to prioritize the coverage of their Country Reports depending on their aquatic genetic resources.

Chapter 1: The Use and Exchange of Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction

The main objective of Chapter 1 is to provide annotated inventories of aquatic genetic resources (AqGR) of farmed aquatic species and their wild relatives.

Farmed aquatic species

1. Over the last 10 years, has production been: *Please mark appropriate box.*

- Increasing
- Stable
- Decreasing
- Stopped
- Still in Research and Development
- Fluctuating
- Not known

2. What is the expected trend over the next 10 years? *Please mark appropriate box.*

- Increasing
- Stable
- Decreasing
- Stopped
- Still in Research and Development
- Fluctuating
- Not known

3. Is the identification and naming of farmed species, subspecies, hybrids, crossbreeds, strains, triploids, other distinct types accurate and up- to-date? *Please mark appropriate box.*

- Yes
- No
- Mostly Yes
- Mostly No

Please include any explanation or additional information here.

Most of the farmed species are named correctly. But the farmed fishes hybrids, crossbreeds, strains are not register in farms. In farms not register hybridization between some species, e.g. Hypophthalmichthys molitrix and H. nobilis, or crossbreeds of Carps and strains of Rainbow trout.
 - Silver carp and bighead carp are present as hybrids in Georgian aquaculture. The silver carp phenotype represents a 75% share in the production of Asian carps.
 - The farming professional community mostly not uses an accurate system of identification and naming.

4. To what extent are genetic data for farmed aquatic organisms

a) Available? *Please mark appropriate box.*

- Not at all
- To a minor extent
- To some extent
- To a great extent

b) Used in management? *Please mark appropriate box.*

- Not at all
- To a minor extent
- To some extent
- To a great extent

Please add any explanation here.

Despite the fact that Georgia has a law "On the new breeds of animals and plants" genetic data on the cultivated aquatic organisms in aquaculture mostly are not available and not being used.

5. To what extent are the aquatic organisms farmed in your country sourced as wild seed or from wild brood stock?

Please mark appropriate box.

- Not at all
- To a minor extent
- To some extent
- To a great extent

Please add any explanation here.

Common carp, bighead carp, silver carp and grass carp breeders are used exclusively from domesticated stocks of fish farms.

European catfish, pike, brown trout, are partly propagated from wild stock.

6. What proportions (%) of breeding programmes and efforts for the genetic improvement of farmed aquatic species in your country are being managed by the public sector (government research, universities etc.), the private sector, and public-private partnerships?

• Percent managed by public sector. **Please Enter Percentage Here**

• Percent managed by private sector. **Please Enter Percentage Here**

• Percent managed by private /public partnership. **Please Enter Percentage Here**

Total

Please add any explanation here.

No „real“ breeding programmes are implemented in Georgian aquaculture.

With 2017 planned works for genetic improvement of farmed carps (crossbreeding, hybridisation, selection, etc.) using local wild stock of common carp.

A breeding programme has been developed for brown trout by a public/private partnership.

7. To what extent do genetically improved aquatic organisms, including hybrids, crossbreeds, strains, triploids and other distinct types contribute to national aquaculture production in terms of volume ?

Please mark appropriate box.

- Not at all
- To a minor extent
- To some extent
- To a great extent

8. Please list most significant examples where genetic improvement contributed to increased production and indicate whether they were developed by public, private or public/private partnerships.

Wild relatives of farmed aquatic species

12. Please list any wild relatives of aquatic species present in your country that are farmed in another country (but not in your country) and indicate their uses.

This question refers to aquatic genetic resources that are present in the wild in your country and that are being farmed elsewhere (but not farmed in your country), indicating any uses these resources may have in your country.

Add Row

Chapter 2: Drivers and Trends in Aquaculture: Consequences for Aquatic Genetic Resources within National Jurisdiction

The main objective of Chapter 2 is to review the main drivers and trends that are shaping aquaculture and their consequences for aquatic genetic resources.

15. Please indicate the ways the aquatic genetic resources (AqGR) of **farmed aquatic species** have been impacted by the following drivers. Please give examples of positive and negative impacts for specific drivers.

This question refers to drivers impacting farmed aquatic genetic resources, not about impacts on the entire aquaculture sector. Drivers should be seen from a national perspective.

Driver impacting aquaculture	Effect on AqGR <i>Mark appropriate box</i>	Comments <i>List examples or other relevant information</i>
Human population increase	<input type="radio"/> Strongly positive <input type="radio"/> Positive <input type="radio"/> Negative <input type="radio"/> Strongly negative <input type="radio"/> No effect <input checked="" type="radio"/> Unknown	The population of country has decreased
Increased wealth and demand for fish	<input type="radio"/> Strongly positive <input type="radio"/> Positive <input type="radio"/> Negative <input type="radio"/> Strongly negative <input type="radio"/> No effect <input checked="" type="radio"/> Unknown	Reliable statistics are not available
Governance (ability of government, industry and the public to work together in managing resources)	<input type="radio"/> Strongly positive <input type="radio"/> Positive <input type="radio"/> Negative <input type="radio"/> Strongly negative <input checked="" type="radio"/> No effect <input type="radio"/> Unknown	Poor cooperation in resource management
Climate change	<input type="radio"/> Strongly positive <input type="radio"/> Positive <input type="radio"/> Negative <input type="radio"/> Strongly negative <input type="radio"/> No effect <input checked="" type="radio"/> Unknown	Not available science-based evidence
Competition for resources, especially freshwater	<input type="radio"/> Strongly positive <input type="radio"/> Positive <input checked="" type="radio"/> Negative <input type="radio"/> Strongly negative <input type="radio"/> No effect <input type="radio"/> Unknown	The strong influence of impacts on resources has hydropower development

17. What countermeasures might be taken to reduce adverse impacts on the aquatic genetic resources that sustain current aquaculture and/or provide for its future development?

Describe countermeasures

The most important tool for ensuring the prevention and mitigation of threats for aquatic genetic resources is the effective legal support for conservation of genetic resources in the planning of hydropower projects. The main task is to implement the principles of conservation biodiversity in the policy development of the Georgian energy sector.

- Ensure legislative consolidation of the powers and functions for enforcement authorities for of control and supervision in the field of genetic safety.
- Include to the State environmental monitoring system one of the subsystems "Monitoring of genetic resources of biotic components of the environment."
- To develop "A Strategy of public accounting, inventory and monitoring of objects of wildlife".
- To develop work on the preparation and approval of a new list of objects of fauna, listed in the Red Book of Georgia
- Ensure effective legal support to the sustainable development of aquaculture in Georgia, as one of the important sectors of the business for food security of the country, improving the welfare of the population (especially in rural areas), conservation of biodiversity and the improvement of environmental quality.

Biotechnologies

18. To what extent have the following biotechnologies been used in your country for the genetic improvement of farmed aquatic organisms.

Biotechnology	Extent of use	Comments <i>main sources of information, important species for which the biotechnology is applied</i>
Selective breeding	<input type="radio"/> Not at all <input type="radio"/> To a minor extent <input checked="" type="radio"/> To some extent <input type="radio"/> To a great extent

Chapter 3: *In Situ* Conservation of Aquatic Genetic Resources of Farmed Aquatic Species and their wild Relatives within National Jurisdiction

The main objective of Chapter 3 is to review the current status and future prospects for the *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives within national jurisdiction for food and agriculture.

The specific objectives are as follows:

- To review the current and likely future contributions to *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives by those who use them in responsible and well managed capture fisheries, aquaculture, and culture-based fisheries.
- To identify and describe any existing and planned aquatic protected areas that are contributing, or will contribute, to *in situ* conservation of aquatic genetic resources of wild relatives of farmed aquatic species.
- To identify and describe any major existing and planned efforts for the *in situ* conservation of threatened or endangered aquatic genetic resources (farmed and wild).
- To review needs and priorities for the future development of *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives.

Overview of the current status and future prospects for the *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives

20. To what extent are responsible and well managed aquaculture and culture-based fisheries contributing to *in situ* conservation of the aquatic genetic resources of farmed aquatic species and their wild relatives.

Please mark appropriate box.

- To a great extent
- To a limited extent
- Not at all
- Not applicable

Please include any additional information

--

21. To what extent are existing facilities contributing to *in situ* conservation of aquatic genetic resources of wild relatives of farmed aquatic species?

Please mark appropriate box.

- To a great extent
 To a limited extent
 Not at all
 Not applicable

Please include any additional information

The main activity of the administrations of protected areas is to prevent illegal fishing, that not sufficient for in situ conservation of aquatic genetic resources of wild relatives of cultivated aquatic organisms

22. Please provide *examples* of current or planned activities for the *in situ* conservation of endangered or threatened farmed species and their wild relatives with demonstrated or potential importance for aquaculture, culture-based fisheries, and capture fisheries.

Please describe examples

23. Please rank (from 1 to 10) the importance of the following objectives for *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives in your country.

Objectives of <i>in situ</i> conservation	Rank 1=Very Important 10=No importance
Preservation of aquatic genetic diversity	<input type="text" value="1"/>
Maintain good strains for aquaculture production	<input type="text" value="1"/>
Meet consumer and market demands	<input type="text" value="1"/>
To help adapt to impacts of climate change	<input type="text" value="4"/>
Future breed improvement in aquaculture	<input type="text" value="1"/>
<i>Please continue listing any other objectives as needed</i>	<input type="text"/>
<input type="button" value="Add Row"/> <input type="button" value="Remove Row"/>	

Review of the *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives through their use in responsible and well managed aquaculture and culture-based fisheries

24. Is the *in situ* conservation of aquatic genetic resources included in the policy as an objective in the management of aquaculture and/or culture-based fisheries in your country?

Please mark appropriate box

- Yes
 Not yet, but planned to be included
 No
 Unknown

If yes, please give examples

25. To what extent are collectors of wild seed and brood stock for aquaculture and culture-based fisheries contributing to the conservation of aquatic genetic resources by maintaining habitats and/or limiting the quantities collected?

Please mark appropriate box

- To a great extent
 To a limited extent
 Not at all
 Not applicable

Please include any additional details

If we consider that in the background of deteriorating habitat a collectors of broodstock for aquaculture and culture-based fisheries concentrated their resources in the controlled conditions of fish farms, this can be described as promoting the conservation of aquatic genetic resources to a limited extent

Review of the *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives through their use in responsible and well managed capture fisheries

26. Is the conservation of aquatic genetic resources of wild relatives of farmed aquatic species included as an objective in the management of any capture fisheries in your country?

Please mark appropriate box

If yes, please give examples

- Yes
 Not yet, but under development
 No
 Unknown

Acquainted with "National Biodiversity Strategy and Action Plan of Georgia 2014 - 2020"

Review of the *in situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives through the establishment and management of aquatic protected areas

27. Please list any aquatic protected areas in your country that are contributing to the *in situ* conservation of aquatic genetic resources of wild relatives of farmed aquatic species and an assessment of effectiveness

Add Row

Aquatic protected area	Effectiveness of conserving Aquatic Genetic Resources	Comments <i>provide any additional information</i>	
Kolkheti National Park	<input type="radio"/> Very effective <input type="radio"/> Somewhat effective <input type="radio"/> Not effective <input checked="" type="radio"/> Unknown	Kolkheti National Park is located in western Georgia. It includes east coast line of Black Sea and Lake Paliastomi basin. National Park is created in order to protect and maintain Kolkheti wetland ecosystems of International importance.	X
Borjomi-Kharagauli National Park	<input type="radio"/> Very effective <input type="radio"/> Somewhat effective <input type="radio"/> Not effective <input checked="" type="radio"/> Unknown	Borjomi-Kharagauli National Park is located in central part of Georgia and creates eastern part of lesser Caucasus Mountains. The total area amounts to 85,083 ha, which is more than 1% of the territory of Georgia.	X
Tusheti Nature Reserve and National Park	<input type="radio"/> Very effective <input type="radio"/> Somewhat effective <input type="radio"/> Not effective <input checked="" type="radio"/> Unknown		X

Aquatic protected area	Effectiveness of conserving Aquatic Genetic Resources	Comments <i>provide any additional information</i>	
Mtirala National Park	<input type="radio"/> Very effective <input type="radio"/> Somewhat effective <input type="radio"/> Not effective <input checked="" type="radio"/> Unknown	Mtirala National Park is located in south-western part of Caucasus, Lesser Caucasus, in particular extreme western part of Achara-Imereti range, on Kobuleti-Chaqvi range, near Black Sea. Its total area is 15698.8 ha.	X
Machakhela National Park	<input type="radio"/> Very effective <input type="radio"/> Somewhat effective <input type="radio"/> Not effective <input checked="" type="radio"/> Unknown		X
Javakheti Protected Areas	<input type="radio"/> Very effective <input type="radio"/> Somewhat effective <input type="radio"/> Not effective <input checked="" type="radio"/> Unknown	Javakheti Protected Areas was established in 2011. It includes Javakheti National Park, Kartsakhi Managed Reserve, Sulda Managed Reserve, Khanchali Managed Reserve, Bugdasheni Managed Reserve and Madatapa Managed Reserve. Javakheti Protected Areas include Municipalities of Akhalqalaqi and Ninotsminda. There are lots of lakes on Javakheti Plateau, including the biggest one – Lake Paravani.	X

Chapter 4: *Ex Situ* Conservation of Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction

The main objective of Chapter 4 is to review the current status and future prospects for the *ex situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives.

The specific objectives are:

- To review existing *ex situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives in aquaculture facilities, culture collections and gene banks, research facilities, zoos and aquaria;
- To review the contributions that various stakeholders are making to the *ex situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives;
- To review needs and priorities for the future development of *ex situ* conservation of aquatic genetic resources of farmed aquatic species and their wild relatives, including any that are threatened or endangered.

Review of existing and planned collections of live breeding individuals of aquatic genetic resources of farmed aquatic species and their wild relatives

28. Please list your country's existing collections of live breeding aquatic organisms that can be considered as contributing to the *ex situ* conservation of aquatic genetic resources. This includes not only collections of species farmed directly for human use, but also collections of live feed organisms (e.g., bacterial flocs, yeasts, microalgae, rotifers and brine shrimp (*Artemia*)).

Review of existing *ex situ* conservation activities of aquatic genetic resources of farmed aquatic species and their wild relatives *in vitro*.

29. Please list your country's *in vitro* collections and gene banks of the gametes, embryos, tissues, spores and other quiescent forms of farmed aquatic species and their wild relatives, using cryopreservation or other methods of long-term storage. Describe the major examples, identifying the facilities in which the collections are held. Include examples of any such genetic material from your country that is being kept in *in vitro* collections outside your country on behalf of beneficiaries in your country.

Add Row

Chapter 5: Stakeholders with Interests in Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction

The main objective of Chapter 5 is to provide an overview of the perspectives and needs of the principal stakeholders who have interests in aquatic genetic resources of farmed aquatic species and their wild relatives for food and agriculture. Stakeholder groups can be identified from existing institutional knowledge, from sectoral and sub-sectoral consultations conducted during the country reporting process and where necessary from expert opinions. Gender issues pertaining to the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives should be considered, as well as the perspectives and needs of indigenous peoples and local communities.

The specific objectives are:

- To describe the different principal stakeholder groups with interests in aquatic genetic resources of farmed aquatic species and their wild relatives To identify the type(s) of aquatic genetic resources of farmed aquatic species and their wild relatives in which each stakeholder group has interests and why.
- To describe the roles of stakeholder groups and the actions they are taking for the conservation, sustainable use and development of the aquatic genetic resources in which they have interests.
- To describe the further actions that stakeholder groups would like to see taken for the conservation, sustainable use and development of aquatic genetic resources in which they have interests, and the constraints that are hindering those actions, including lack of capacity and perceived threats.

Overview of the principal stakeholder groups who have interests in aquatic genetic resources of farmed aquatic species and their wild relatives

31. Please indicate the principal stakeholder groups who have interests in aquatic genetic resources of farmed aquatic species and their wild relatives including, *inter alia*: fish farmers; fishers in capture fisheries; persons involved in stocking and harvesting in culture-based fisheries; persons employed in postharvest chains; government officials; staff and members of aquaculture associations; managers of aquatic protected areas and others working for the conservation of aquatic ecosystems; researchers; and civil society.

Some local communities are actively involved in the protection of aqua biological resources at the local level

Chapter 6: National Policies and Legislation for Aquatic Genetic Resources of Farmed Aquatic Species and their Wild Relatives within National Jurisdiction

The main objective of Chapter 6 is to review the status and adequacy of national policies and legislation concerning aquatic genetic resources of farmed aquatic species and their wild relatives including access and benefit sharing.

The specific objectives are as follows:

- To describe the existing national policy and legal framework for the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives.
- To review current national policies and instruments for access to aquatic genetic resources of farmed aquatic species and their wild relatives and the fair and equitable sharing of benefits arising from their utilization.
- To identify any significant gaps in policies and legislation concerning aquatic genetic resources of farmed aquatic species and their wild relatives..

Review of national policies and legislation for Aquatic Genetic Resources of farmed aquatic species and their wild relatives within national jurisdiction

32. Please list national legislation, policies and/or mechanisms that address aquatic genetic resources of farmed species and their wild relatives (see question 47 regarding international agreements).

Review of the current status and gaps in national policies and legislation for the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives

33. Please list any gaps in the coverage or constraints in implementing national legislation, policies and/or mechanisms in regard to aquatic genetic resources.

In spite of the development trends of fisheries in the world, the Georgian legislation still focuses on aquatic biological resources as an integral part of biodiversity, that can be used for fishery.
The country lacks a legislative and regulatory framework for the sustainable development of aquaculture.

34. Please indicate any national aquatic genetic resources of farmed aquatic species and their wild relatives for which your country restricts access.

Type of genetic resource (can be species name, DNA, gametes or other descriptor)	Comments
	<i>Please, provide verifiable main sources of information, effectiveness of the restriction, description of type of restriction and for whom does the restriction apply</i>
DNA	Act on new breeds of animals and plants -The law prohibits the use of genetic engineering methods in animal breeding.
Stock, breed or variety	Act on new breeds of animals and plants - The law regulates the legal protection of new species of animals and their use of agricultural and applies to all new genera and species of the agricultural animals.
Species	The Red Book of Georgia Sturgeon and Salmonid fishes Regulations on fishing and protection of fish stock This Regulation regulates the fishing rules, the timing of fishing and allowable fishing gear.

Chapter 7: Research, Education, Training and Extension on Aquatic Genetic Resources within National Jurisdiction: Coordination, Networking and Information

The main objective of Chapter 7 is to review the status and adequacy of national research, education, training and extension, coordination and networking arrangements and information systems that support the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives for food and agriculture.

The specific objectives are:

- To describe the current status, future plans, gaps, needs and priorities for research, training, extension and education on the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives
- To describe existing or planned national networks for the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives.
- To describe existing or planned information systems for the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives.

Research

37. Does your national research programme support the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives? If yes, give details of current and/or planned research; if no, explain the main reasons why not in box below.

Please mark appropriate box

- Yes
 No
 Unknown

Please provide details

Only in 2017 will begin to operate a state program of scientific research on the sustainable use and development of aquatic genetic resources of carp and salmon species

38. Please list main institutions, organizations, corporations and other entities in your country that are engaged in field and/or laboratory research related to the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives.

Add Row

Main institutions, organizations, corporations and other entities	Area of research <i>Mark all that apply</i>	Comments <i>Please provide any additional information</i>

Please specify in box below

43. Please list any national networks in your country or any international networks your country belongs to that support the conservation, sustainable use and development of aquatic genetic resources.

Add Row

Network	Objectives of the network <i>Please mark all that apply</i> to your country	Comments	
	<input type="checkbox"/> Improve basic knowledge on aquatic genetic resources <input type="checkbox"/> Improve capacities for characterization and monitoring of aquatic genetic resources <input type="checkbox"/> Improve capacities for genetic improvement <input type="checkbox"/> Improve capacities for economic valuation of aquatic genetic resources <input type="checkbox"/> Improve capacities for conservation of aquatic genetic resources <input type="checkbox"/> Improve communication on aquatic genetic resources <input type="checkbox"/> Improve access to and distribution of aquatic genetic resources		X

Information systems

44. Please list any information systems existing in your country for receiving, managing and communicating information about the conservation, sustainable use and development of aquatic genetic resources of farmed aquatic species and their wild relatives.

Add Row

Name of information system	Type of information stored <i>mark all that apply</i>	Main stakeholders <i>mark all that apply</i>	
	<input type="checkbox"/> DNA sequence <input type="checkbox"/> Genes and genotype <input type="checkbox"/> Breeds, strains or stocks <input type="checkbox"/> Species names <input type="checkbox"/> Production figures <input type="checkbox"/> Distribution <input type="checkbox"/> Level of endangerment <input type="checkbox"/> Other	<input type="checkbox"/> Fish farmers <input type="checkbox"/> Fishers in capture fisheries <input type="checkbox"/> Fish hatchery people <input type="checkbox"/> People involved in marketing <input type="checkbox"/> Government resource managers <input type="checkbox"/> Fishing or aquaculture associations <input type="checkbox"/> Aquatic protected area managers <input type="checkbox"/> University and academic people <input type="checkbox"/> Non-Governmental Organizations <input type="checkbox"/> Intergovernmental Organizations <input type="checkbox"/> Policy makers <input type="checkbox"/> Donors <input type="checkbox"/> Consumers <input type="checkbox"/> Politicians <p>Please list other stakeholders as necessary</p> <div data-bbox="1057 1551 1446 1713" style="border: 1px solid black; height: 77px; width: 240px;"></div>	X

45. What capacity strengthening is needed to improve national information systems to support the conservation, sustainable use and development of aquatic genetic resources?

Please describe what capacities need to be strengthened

It is necessary start work to create them

Please describe any other capacity building needs in regards to information systems for aquatic genetic resources

Chapter 8: International Collaboration on Aquatic Genetic Resources of Farmed Aquatic Species and Their Wild Relatives

The main objective of Chapter 8 is to review the mechanisms and instruments through which your country participates in international collaborations on aquatic genetic resources of farmed aquatic species and their wild relatives.

The specific objectives are:

- To identify your country's current participation in bilateral, sub-regional, regional, other international and global forms of collaboration on aquatic genetic resources. List national memberships, status as a Party and other forms of affiliation in agreements, conventions, treaties, international organizations, international networks and international programmes.
- To identify any other forms of international collaboration on aquatic genetic resources.
- To review the benefits from existing forms of international collaboration on aquatic genetic resources.
- To identify needs and priorities for future international collaboration on aquatic genetic resources

International collaboration includes bilateral arrangements and the sharing of particular waters and stocks of wild relatives of farmed aquatic species.

International, regional or sub-regional agreements, conventions and treaties concerning aquatic genetic resources of farmed aquatic species and their wild relatives

46. Please list the international, regional or sub-regional agreements your country subscribes to that cover aquatic genetic resources of farmed species and their wild relatives, such as the Nagoya Protocol² the Convention on Biological Diversity and the Cartagena Protocol and how they have impacted aquatic genetic resources and stakeholders in your country. Examples could include:

² <http://www.cbd.int/abs/nagoya-protocol/signatories/>

- Establishment and management of shared or networked aquatic protected areas as far as wild relatives of farmed aquatic species are concerned
- Aquaculture and culture-based fisheries in transboundary or shared water bodies
- Sharing aquatic genetic material and related information
- Fishing rights, seasons and quotas as far as wild relatives of farmed aquatic species are concerned
- Conservation and sustainable use of shared water bodies and watercourses as far as wild relatives of farmed aquatic species are concerned
- Quarantine procedures for aquatic organisms and for control and notification of aquatic diseases

48. Please describe the types of collaboration that have been most beneficial for your country, and why?

Cooperation is necessary for introduce the governance and the protection of aquatic genetic resources in Georgia.

49. Is there a need for your country to expand its collaboration concerning the conservation, sustainable use and development of aquatic genetic resources? If yes, give details, including any requirements for capacity strengthening in box below

Yes

No

If yes, please give details

Exchange of genetic material of farmed fish with cooperating countries;
Exchange of information and expertise with partners from neighboring countries;
Joint research projects with partners from neighboring countries;

50. Describe important roles that your country performs within its region (and/or sub-region) and globally in terms of being a keeper, user and sharer of aquatic genetic resources.

Georgia, as a part of the Caucasus, included to 200 Global Ecoregion of WWF, at the same time, this biodiversity is under threat the degradation and destruction, which is why the Caucasus included among the world's 34 biodiversity hot spots.

In fresh waters of Georgia 84 common fish species. In the Caspian Sea basin inhabits 29 species, 17 of which are found in the Caspian Sea basin and the Black Sea basin. In the Kura River basin there are 12 native species, of which 9 are endemic to the Kura River and its tributaries. There are several economically important species among them.

In the basin of the Black Sea inhabited by 66 species of fish. Here dwell 6 endemic fish species. Among them are 2 economically important species.

Two fish species: The Black Sea salmon (*Salmo trutta labrax*) and Atlantic sturgeon (*Acipenser sturio*) are included in the IUCN Red List.
