

WATER USE EFFICIENCY

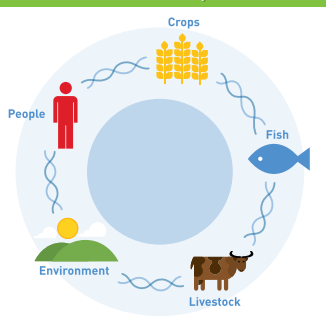

With continuing population growth, rising incomes and urbanization, food demand will roughly double in the next fifty years

PRODUCING MORE FOOD WITH LESS WATER

we must make better use of water along the whole chain from the farm to the market while preserving and restoring healthy ecosystems

A comprehensive approach to water must take into account crops, fisheries, livestock, and land management while guaranteeing environmental sustainability

Water use efficiency and productivity increase through better on-farm water management, improvement of irrigation system performance and adjustments of irrigation policies
