GLOSSARY

FOREWORD

This volume is one of a series of three which together present the FAO/UNEP recommended methodology on animal genetic resources data banks. The three volumes are as follows:

1. Computer systems study
2. Descriptor lists for cattle, buffalo, pigs, sheep and goats
3. Descriptor lists for poultry.

Volumes 2 and 3 each include instructions on how to use the Descriptor Lists and how to prepare data for entry.

The material in these three volumes derives from the Trials held by FAO/UNEP in Africa, Asia and Latin America in the period 1983-85. In Africa individual scientists in both anglophone and francophone countries were involved in defining descriptors suitable for each species. In Asia and Latin America several countries carried out national projects to extract data from their own original source documents, to create descriptors, and also to enter the data into a computer system. These countries were Malaysia, Mexico, Sri Lanka, Thailand and Venezuela. From their experiences it was possible also to define the personnel needed for the work and to calculate the time needed. A study of suitable computer systems was also undertaken using the experiences in each country, and cost estimates made for the establishment of regional data banks. These are in Volume 1.

In each region planning/evaluation meetings of all the involved personnel were held. The recommendations of these regional meetings were then appraised by an Expert Consultation held by FAO/UNEP in Rome in June 1985. At that time the experts recommended the publication of the results of the Trials as the Recommended FAO/UNEP Methodology for Animal Genetic Resources Data Banks.

Not only did the Trials make it possible to design, test and cost a method of operating regional data banks, but they also showed clearly the need for such banks as a tool for all those concerned with animal production, especially those concerned with the formulation of development projects which include components of animal breeding and genetics. It was discovered that there is a great wealth of data in source documents in developing countries which describes the experiences with different breeds of animals and their production and reproduction potentials. However, only 25-30 percent of this information is accessible to potential users, either in the country or elsewhere, for it is largely unpublished or is published in languages or journals not routinely scanned by the international abstracting organizations. This represents a great loss of valuable information and undoubtedly leads to the repetition of costly mistakes in project formulation, extension and development programmes as well as the duplication of effort in new research. The creation of a regional data bank in each of the four regions Africa, Asia, Near East and Latin America and the Caribbean was recommended by the experts, in order to serve the countries in those regions. In view of the increasing movement of animals and germplasm from one environment to another with all the hazards to their survival and productivity which are posed by more hostile climate, disease and feed resources, it is essential that genetic characterizations of the breeds and established crosses and of the environments to which they are adapted or not adapted should be available.

EXTRACTION AND PREPARATION OF DATA

1. INTRODUCTION

This chapter gives guidelines for extracting data on breed characteristics and for assembling them in an appropriate fashion for subsequent compilation into the approved Descriptor List. The person preparing data (compiler) is reminded of the role of the Data Bank (DB) and urged to keep in mind its value as a pool of information on breed characteristics within defined environments. The compiler should also keep in mind the needs of users for information relevant to the future utilization of animal genetic resources in other similar or dissimilar environments. Thus, this exercise of data extraction and presentation must include an exhaustive search of the published literature and other unpublished data sources, the evaluation of these sources and the extraction of valid genetic and associated environmental information and preparation of this information in a form suitable for entry into the Descriptor Lists.

2. WHERE TO FIND THE DATA

The data for the Data Bank will be derived from various published or unpublished sources. A Source is defined here as any document having authentic data which would add to the sum of knowledge about the genetic characteristics of a breed. The Source could have been written in any language. The likely types of Sources are listed below.

- i. published scientific papers,
- ii. papers presented in conferences with or without proceedings,
- iii. specific reports or case studies,
- iv. annual reports (livestock stations, research centres, government departments),
- v. theses, graduate and undergraduate, and
- vi. vi) stores of unpublished data ('idle' data).

The Data Bank does not include individual animal records but performance statistics of groups of animals of known breed type and conditions under which these statistics were measured. They should be entered in English, using the Descriptor lists in this publication. Similar Descriptor Lists in French and Spanish are available.

3. THE WORKING GROUP

All the persons involved should understand the background objectives and the basic principles of data handling. The team leader must have the following qualifications:

- i. should be an animal geneticist by training, and should also have professional experience with the species being studied,
- ii. have a good general knowledge of animal production,
- iii. have the ability selectively to extract relevant information and be able to judge the authenticity of the source material.
- iv. have some appreciation of statistics and computerization.

The assisting members of the team should preferably have a degree in Animal Science, Veterinary Science or Biological Sciences. Non professional members could assist in restricted areas such as compilation of data on rainfall, environmental temperatures etc. for various stations covered by the Sources. It is emphasised that the team leader be closely involved in training the team members and at all stages of the data extraction.

4. A NOTE OF CAUTION TO COMPILERS

The Descriptor List is comprehensive, covering all aspects of the breed characteristics and almost all classes of livestock. It was derived from trials in different countries in Africa, Asia and Latin America, and covers all possible traits of interest and occurrence. As a result it is massive. It is therefore emphasized here that the compiler should study the general pattern and contents of the Descriptor List first. Then the mode of execution is to look and search from each source, data on genetic characterization. It is not to look at the Descriptor List each time and search for corresponding data from the source. From past experience, each source is likely to provide data for only 5 to 40 percent of the options listed in the Descriptor List.

The Descriptor List should serve as a dictionary of genetic characteristics and should be used as a format for layout of the Source Data Sheet prepared by the compiler before entering them into the system (see item 10 of these guidelines).

5. GENERAL LAYOUT OF DESCRIPTOR LIST

The Descriptor List is divided into two components.

Master Record. This record refers to physical characteristics of the breed within the species. Descriptive features have been categorised and may require the compiler to make decisions. For instance, in the case of hump size (large or medium or small) or proportion of a colour. Each species will have one Master Record for each of its breeds or strains. This record for the strain need not necessarily be derived from a single Source, but from a number of Sources and may also include additional information supplied by the compiler himself. This will allow the compiled Master Record to consist of one complete set of information on the physical characteristics of the strain.

Slave Record. This consists of performance characteristics of a group of animals of a breed or strain within a species. It also contains provisions for entering environmental characteristics if such details are given in the Source. Every Source will result in one Slave Record. But if the Source has performance characteristics of more than one breed, than this Source will provide one Slave Record for each breed; in this case environmental details are repeated for each of these Slave Records, unless of course the breeds were raised differently. In exceptional circumstances, an author may have published two or more papers covering different traits in each paper but all derived from the same group of animals maintained over the same time period. The information from these sources could be pooled into a single Slave Record. If these papers compared several breeds, then, the resulting number of Slave Records will correspond to the total number of breeds in all these papers.

After a complete exercise, the end result is one Master Record for each breed or crossbred and a larger number of Slave Records for each breed or crossbred. Each Slave Record derives from one Source, (or from several only in exceptional circumstances when several Sources report on the same animals). On the other hand, each Source contributes a Slave Record for each breed or crossbred type reported.

6. PROCEDURE FOR MASTER RECORDS

The Master Record is made up of breed descriptive data and is qualitative in nature. Attempts have been made in the Descriptor Lists to categorise descriptors such as body colours, horn shape and size, temperament and belly shape into fixed format alternatives (e.g. straight vs. curved; short, medium or long and colour percent). Compilers need to be consistent in their subjective evaluations. For other traits, for example, resistance to diseases and parasites, format free fields for word description are allowed. It is requested that such descriptions need to be precise and short.

Usually very few publications are available which describe the physical features of a breed. Therefore, the Master Record in spite of the lack of published data, should be completed as far as possible with added information based on personal experiences. Visual examination of the animals should be necessary to reduce unfilled gaps in the record.

As some of the data in the Master Record are subjective measures, it is recommended that all Master Records for a group of breeds or crosses be completed within an uninterrupted period of time so as to ensure uniformity.

Experience shows that about three man-days are normally necessary to complete one Master Record for a breed if the breed is available in the station where the geneticist who is compiling the data is working.

7. PROCEDURE FOR SLAVE RECORDS

All Sources after 1960 should be used to develop the Data Bank. Exceptionally Sources before 1960 may be considered valuable, but it is recommended not to search for Sources before 1960 normally. The Source should first be reviewed. Subsequently, if it is found to be suitable, information can be extracted for Data Bank use.

Review of Source: Each source needs to be studied carefully and the following points noted.

- i. Reliability. The authenticity of the data in the source need to be judged and a value between 1 (most reliable) and 5 (least reliable) be given. (Item 8 in Slave Record). Various factors such as statistical results (number of observations, standard deviations), management system, feeding standards and clear presentation of experimental design or model will serve as indicators.
- ii. Documentation vs. Evaluation. The distinction between these two in each Source should be made. Documentation is simply the collation of existing data whereas Evaluation is a contemporary comparison of performance records of two or more breeds under the same environmental circumstances. Though each breed or

strain within the Source will be presented in separate Slave Records, linkage between' them will be maintained through the bibliographical reference field. (Item 6 in Slave Record).

- iii. Bibliographical Reference. All Sources should be referenced even if some were found not useful. In such instances only item 6 of Slave Record will be filled. This will allow users to know the material was scanned but not used. The following sample formats need to be strictly followed in quoting the Source reference.

Journal:

Johnson, S.A., T. Killer and A. Victor. 1981. The relative performance of Friesian and Brown Swiss cattle in Nigeria. *J. Anim. Sci.* 51: 2222-2275.

Proceedings:

Nanda, K. and S. Singam. 1972. Growth rate and milk yield of Selembu cattle in Malaysia. *Proc. Malaysian Society of Animal Production*, 8th Ann. Conf., p. 197-200.

Annual Report:

Black, T. and M. White. 1965. Performance of Black and White cattle in South Africa. *Ann. Rpt. No. 32. 1970, Agric. Res. Inst. , London.*

Mahendra, M. and V. Buva. 1982. Factors affecting performance of Friesian crossbred cattle in Sri Lanka. *Ministry of Agriculture, Sri Lanka, No. 3, 56 pp.*

Idle data:

Hoest, R. and M.E. Berg. 1985. Unpublished data Livestock Department, Ministry of Agriculture, Kuala Lumpur, Malaysia.

Extraction of data: As much relevant information as possible must be extracted from the Sources. The Slave Record descriptor list needs to be referred to constantly especially during early stages, Generally, the extraction of data from the Sources may not be straight forward. Often a considerable amount of data editing is necessary and the following is a brief summary of types of data:

- i. Actual Data. This is the data taken directly from the Source and transferred on to Source Data Sheets (see Section 9 of this manual) such as breed average 305-day milk yield, yearling weight and the associated number of observations, standard deviation and ranges. These figures are as given in the text of the Source.
- ii. Summarised Data. Many authors give annual averages for a single trait with standard deviations and number of observations for each breed. Overall means and standard deviations need to be calculated the latter from the pooled sums of squares. An example is given in Appendix 1. A similar procedure should be followed if data are presented by herds within farm or other similar groupings.
- iii. Transformed data. Some data such as those on feeding, management and adaptive characteristics are described in Sources. These data need to be

summarised and transformed into defined alternatives suitable for the standardised format of the Slave Record. For instance, grazing management may be described along with concentrate feeding giving various components. These need to be clearly defined and entered into section 18 of Slave Record.

- iv. Additional Data. This refers to data pertaining to the Source but not given in the Source. The compiler should limit such supplementary data to some environmental characteristics such as meteorological records covering the period of study in the report. If accurate management characteristics such as type of housing, could be obtained from the station or from the author, they may be included. However, caution should be taken against extrapolation, guess work or searches that involve unwarranted time. Such additional data should be minimum and undertaken only if the compiler geneticist feels that such data are absolutely necessary for understanding the results.

In the case of 'idle' *data*, the compiler is expected to conduct some minimum statistical analysis as required by the Slave Record. Environmental data with relevant and reliable details should also be provided.

All statistics should be given in the metric system. Conversions from inches, lb and Fahrenheit to cm, kg and Celsius respectively, are given in Appendix 1.

During the process of data extraction, some common problems may be encountered, as follows:

- i. Repeated data. There may be a few cases where part of the data in a Source is repeated in another. Only the first Source needs to be used.
- ii. Adjusted data. If both raw averages as well as adjusted data are given for the same traits, the latter is recommended. Factors for which adjustments have been made to the data, need to be mentioned in section 7 of Slave Record. If only some traits were adjusted, then these traits need also be mentioned in the same section.
- iii. Feeding trials. If some useful breed information is available from Sources that are nutrition orientated, and if the sample sizes are greater than 20 head per breed, then they could be used.
- iv. Incomplete statistics. A few Sources, though of reliable origin, may report only averages for each trait without number of animals used and/or standard deviations. These sources should also be included, and the blank spaces in the Descriptor List will indicate the lack.

8. RELEVANT DETAILS

The compiling geneticist is encouraged to be specific and accurate while transcribing data from Sources for the Data Bank. For example, if yields of a dairy herd were given and during the period of data recording the cows were herded for some days and strip grazed on other days, both of these should be indicated in Section 8.1.1 of Slave Record of Cattle Descriptors. In addition, if details are given, the compiler should include the proportion of time for each, e.g.

herded (20%)
strip grazed (80%)

9. PRESENTATION OF DATA FOR DATA ENTRY

The Master and Slave Records should be prepared separately. Any one Source will usually have less than 40 percent of the characteristic listed in the Descriptor Lists. Therefore, to complete a set of Descriptor List for each Source will mean bulky copies of the descriptors and many items whose contents only partially filled. Further, because of the size of the Descriptor List, the necessity of reviewing the Sources before extraction of the relevant data, the need for processing of some of the data and to allow layoff time for data collection on climate, direct entry of data from Source into the computer system is not possible. It is therefore suggested that the extracted data be written on to a sheet of paper, the Source Data Sheet. Relevant climatic details are also added to the list as these details come in. In order to maintain the meaningful link between the data and its name headings, the corresponding descriptor number that appears on the left of the descriptor list (e.g. 4.4.1.1.2) is also written alongside the data on the Source Data Sheets as tag numbers. The resulting Source Data Sheets derived from the various sources are now ready for entry into the system. An example of a Source Data Sheet for a cattle Slave Record is given below.

Tag number	Source Data Sheet for a Source				
1	Kedah-Kelantan				
2	purebred				
4	800112 - 830531				
6	Mahatir, M. and S. Velu. 1970 Performance of Kedah-Kelantan cattle in Malaysia. J. Animal Sc. 32 : 1-20.				
8	3				
9	Malaysia				
9.1	Serdang				
18.1.1.3	Tethered				
18.1.2.2	improved				
18.1.4.1	Bracharia decumbens		60%		
18.1.4.2	Paspalum spp.		10%		
18.1.5.1	Centrosema		30%		
18.3.1.1	Rice bran		70%		
18.3.1.2	Molasses		20%		
18.3.1.3	Urea		3%		
18.3.1.4	Mineral mixture		7%		
18.3.2	4 kg per day per head for two weeks before calving, 3 kg. per day per head from calving to end of 100 days and 1 kg per day per head until end of lactation.				
-					
-					
-					
22.1.1.1		300	18.5	3.2	16.1-20.5

	-			
	-			
	-			
22.8.4.2	25	2.3	0.5	3.0-5.1

10. TIME FRAMEWORK

As a guide to compilers, a brief time framework is given in Appendix 2 for the various steps in the data search, extraction and presentation. This is based upon the experiences in the two-year trials held in different countries in Africa, Asia, and Latin America from 1983-85.

11. SUMMARY

Various source materials published after 1960 will be scanned and breed or strain characteristics extracted and presented in a format (free as well as fixed) that could be easily entered into a computer system. The presentation will be separate for physical characteristics (in Master Records) and performance and environmental characteristics (in Slave Records). A summarised flow chart is given below for the data extraction and presentation. For each breed/strain represented in the country, there will be one Master Record and several Slave Records. The latter will depend on the number of publications available.

A. To summarise data

e.g.	Statistics	1980	1981	1982
	n :	20	30	51
	mean (x)	20.1	19.5	21.5
	S.D.(s)	6.5	4.0	2.8
	range	18.0-21.6	17.0-21.5	19.5-24.3

1. Calculate overall total, T

$$\begin{aligned}
 T &= n \cdot \bar{x} \\
 &= (20 \times 20.1) + (30 \times 19.5) + (51 \times 21.5) \\
 &= 402.0 + 585.0 + 1096.5 \\
 &= 2083.5
 \end{aligned}$$

2. Calculate total number of observations, N and overall mean.M

$$\begin{aligned}
 N &= n_1 + n_2 + n_3 \\
 &= 20 + 30 + 51 \\
 &= 101
 \end{aligned}$$

$$\begin{aligned}
 M &= T / \sum n_i \\
 &= 2083.5 / (20 + 30 + 51) \\
 &= 20.6
 \end{aligned}$$

3. Calculate annual variance, s²

$$\begin{aligned}
 s_1^2 &= 42.25 \\
 s_2^2 &= 16.00 \\
 s_3^2 &= 7.84
 \end{aligned}$$

4. Calculate annual totals, t

$$\begin{aligned}
 t_1 &= n_1 \times \bar{x}_1 = 20 \times 20.1 = 402.0 \\
 t_2 &= n_2 \times \bar{x}_2 = 30 \times 19.5 = 585.0 \\
 t_3 &= n_3 \times \bar{x}_3 = 51 \times 21.5 = 1096.5
 \end{aligned}$$

5. Calculate overall sum of square, S

$$\begin{aligned}
 S_1 &= [s_1^2 (n-1)] + [x_1 t_1] \\
 &= [42.25 \times 19] + [20.1 \times 402.0] \\
 &= 8883.0 \\
 S_2 &= 11871.5 \\
 S_3 &= 23966.8 \\
 \\
 S &= S_1 + S_2 + S_3 \\
 &= 8883.0 + 11871.5 + 23966.8 \\
 S &= 44721.3
 \end{aligned}$$

6. Calculate overall variance, V and standard deviation, SD

$$\begin{aligned}
 V &= \frac{S - MT}{N-1} \\
 &= \frac{44721.3 - (20.6 \times 2083.5)}{100} \\
 &= 18.0 \\
 SD &= \sqrt{18} \\
 &= 4.2
 \end{aligned}$$

Thus the overall number of observations, mean and standard deviations are 101, 20.6 and 4.2 respectively and range 17.0 to 24.3

B. Metric Conversion

- i. To convert means and standard deviations given in lb to kg, simply divide by 2.21.
- ii. To convert means and standard deviations given in inches to cm, simply multiply by 2.54
- iii. To convert from Fahrenheit (F) to Celsius (C).

$$^{\circ}\text{C} = \frac{5}{9} (F - 32)$$

Guideline of time required

	Approximate %	Approximate man-days/source
i) Search for source	40	variable
ii) Collect data for Master Record	15	3
iii) Review each Source for Slave Record	15	1/2
iv) Data extraction	25	1/2 to 7
v) Presentation for data entry	5	1

| 4.11 | Conservation status | |
| | 4.11.1 endangered | |
| | 4.11.2 vulnerable | |
| | 4.11.3 rare | |
| | 4.11.4 indeterminate | |
| | 4.11.5 out of danger | |
| | 4.11.6 insufficiently known | |
| | 4.11.7 not at risk (none of the above) | |

The first six of these categories are used by the International Union for the Conservation of Nature and Natural Resources. Their definitions, slightly amended, are as follows.

Endangered : Breeds in danger of extinction, and whose survival is unlikely if the causal factors continue operating.

Vulnerable: Breeds likely to move into the Endangered category in the near future if the causal factors continue operating

Rare: Breeds with small populations that are not at present Endangered or Vulnerable, but are at risk.

Indeterminate: Breeds known to be Endangered, Rare or Vulnerable, but where there is not enough information to say which of the three categories is appropriate.

Out of Danger: Breeds formerly included in one of the above categories, but which are now considered relatively secure because effective conservation measures have been taken or the previous threat to their survival has been removed.

Insufficiently Known: Breeds that are suspected but not definitely known to belong to any of the above categories, because of lack of information.

% of sward
 - 18.1.5.n species n
% of sward
- 18.2 Fodder crops
 - 18.2.1 cut green fodder
 - 18.2.2 hay
 - 18.2.3 silage
 - 18.2.4 other (specify)
 - 18.2.5 free format field for amounts fed
- 18.3 Concentrates
 - 18.3.1 ingredients
 - 18.3.1.1 ingredient 1 [name]
% of concentrate diet
 - 18.3.1.2 ingredient 2
% of concentrate diet
 - 18.3.1.n ingredient n
% of concentrate diet
 - 18.3.2 free format field for amounts of concentrates fed
[For 18.2.5 and 18.3.2. as a minimum entry specify whether feeding is ad-lib. or not ad-lib.]
- 18.4 Water
 - 18.4.1 sufficient to meet requirements
 - 18.4.2 supply inadequate
[Specify months in which supply is inadequate. e.g. 03 to 05.]
- 18.5 Minerals
 - 18.5.1 supply adequate
 - 18.5.1.1 supplements not fed
 - 18.5.1.2 supplements fed
 - 18.5.2 supply inadequate
 - 18.5.2.1 supplements not fed
 - 18.5.2.2 supplements fed
- 18.6 Seasonality of nutrition
 - 18.6.1 feeding adequate all year round
 - 18.6.2 feeding inadequate in some months (specify)
- 18.7 Calf feeding
 - 18.7.1 suckling (specify weaning age)
 - 18.7.2 milk replacer system
- 19. Housing
 - 19.1 none
 - 19.2 only during the day
 - 19.3 only at night

19.4 day and night

19.5 for part of day

19.6 type (specify)

Diseases and parasites

20. [Free format field for noting any diseases prevalent at the time that performance data were recorded.]

Measures against diseases and parasites

21. [Free format field for recording prophylactic measures; in particular, dipping, anthelmintic dosing and vaccination.]

22. Performance

Body weight

	females	

docile
 moderately tractable
 wild

- 4.7 Wallowing preference
 clean water
 mud

- 4.8 Conservation status
 4.8.1 endangered
 4.8.2 vulnerable
 4.8.3 rare
 4.8.4. indeterminate
 4.8.5 out of danger
 4.8.6 insufficiently known
 4.8.7 not at risk (none of the above)

The first six of these categories are used by the International Union for the Conservation of Nature and Natural Resources. Their definitions, slightly amended, are as follows.

Endangered: Breeds in danger of extinction, and whose survive is unlikely if the causal factors continue operating.

Vulnerable : Breeds likely to move into the Endangered category in the near future if the causal factors continue operating.

Rare : Breeds with small populations that are not at present Endangered or Vulnerable, but are at risk.

Indeterminate: Breeds known to be Endangered, Rare or Vulnerable, but where there is not enough information to say: which of the three categories is appropriate.

Out of Danger: Breeds formerly included in one of the above categories, but which are now considered relatively secure because effective conservation measures have been taken or the previous threat to their survival has been removed.

Insufficiently Known: Breeds that are suspected but not definitely known to belong to any of the above categories, because of lack of Information.

- 4.8 Free format breed description field

[A description of breed characters may be entered here instead of the fixed fields of sections 4.3 to 4.7. or material may be added to supplement the fixed fields.]

 - males
 - females
 - 5.9.1.4 fat rump without short appendage
 - males
 - females
 - 5.9.1.5 semi-fat (thick at base)
 - males

- 5.12.5 out of danger
- 5.12.6 insufficiently known
- 5.12.7 not at risk (none of the above)

The first six of these categories are used by the International Union for the Conservation of Nature and Natural Resources. Their definitions, slightly amended, are as follows.

Endangered: Breeds in danger of extinction, and whose survival is unlikely if the causal factors continue operating.

Vulnerable: Breeds likely to move into the Endangered category in the near future if the causal factors continue operating.

Rare: Breeds with small populations that are not at present Endangered or Vulnerable, but are at risk.

Indeterminate: Breeds known to be Endangered, Rare or Vulnerable, but where there is not enough information to say which of the three categories is appropriate.

Out of Danger: Breeds formerly included in one of the above categories, but which are now considered relatively secure because effective conservation measures have been taken or the previous threat to their survival has been removed.

Insufficiently Known: Breeds that are suspected but not definitely known to belong to any of the above categories, because of lack of information.

5.13 Drought tolerance

[Allocate grades 1-5; l=high]

5.14 Heat tolerance

[Allocate grades 1-5; l=high]

5.15 Free format breed description field

[A description of breed characters may be entered here instead of the fixed fields of sections 5.2 to 5.11. or material may be added to supplement the fixed fields.]

15. Degree of management supervision

15.1 Advisory services

15.2 Resident professional supervision

15.3 Supervision by scientific staff of investigation project

15.4 None

16. Mating

16.1 Mating methods in flocks

16.1.1 rams continually with ewes - uncontrolled mating

16.1.2 rams continually with ewes but mating prevented except
at specified times

16.1.3 rams separated from ewes except
at specified times

16.1.4 hand mating

16.1.5 AI

fresh semen

frozen semen

fresh and frozen semen

16.1.6 AI followed by natural or hand mating

fresh semen

frozen semen

fresh and frozen semen

16.1.7 other (specify)

16.2 Mating ratio

16.2.1 number of females per male in natural mating

16.2.2 number of females per male in hand mating

16.2.3 number of females per male in AI

16.3 Mating period

16.3.1 number of days males are put with females in natural mating

16.3.2 number of mating periods per year

17. Flock size

17.1 Number of breeding ewes

17.2 Number of bred hoggets

17.3 Number of replacement females (weaning to transfer into breeding flock)

17.4 Number of rams used for breeding

17.5 Number of reserve rams

17.6 Number of lambs (birth to weaning)

17.7 Number of postweaners for meat production

17.8 Percentage of breeding ewes that are milked annually

18. Nutrition

18.1 Grazing

18.1.1 method

18.1.1.1 zero grazed

18.1.1.2 extensively in a shepherded flock

18.1.1.3 fenced

18.1.1.4 strip grazed

18.1.2 pasture classification

18.1.2.1 unimproved

18.1.2.2 improved

18.1.3 water supply of pasture

18.1.3.1 rainfed

18.1.3.2 irrigated

 - moderately tractable
 - wild
 - females
 - docile
 - moderately tractable
 - wild
- 6.11 Drought tolerance
 - [Allocate grades 1-5; 1=high]
- 6.12 Heat tolerance
 - [Allocate grades 1-5; 1=high]
- 6.13 Resistance to diseases and parasites
 - [Free format field; write word description]
- 6.14 Conservation status
 - 6.14.1 endangered
 - 6.14.2 vulnerable
 - 6.14.3 rare

- 6.14.4 indeterminate
- 6.14.5 out of danger
- 6.14.6 insufficiently known
- 6.14.7 not at risk (none of the above)

The first six of these categories are used by the International Union for the Conservation of Nature and Natural Resources. Their definitions, slightly amended, are as follows.

Endangered: Breeds in danger of extinction, and whose survival is unlikely if the causal factors continue operating.

Vulnerable: Breeds likely to move into the Endangered category in the near future if the causal factors continue operating.

Rare: Breeds with small populations that are not at present Endangered or Vulnerable, but are at risk.

Indeterminate: Breeds known to be Endangered, Rare or Vulnerable, but where there is not enough information to say which of the three categories is appropriate.

Out of Danger: Breeds formerly included in one of the above categories, but which are now considered relatively secure because effective conservation measures have been taken or the previous threat to their survival has been removed.

Insufficiently Known: Breeds that are suspected but not definitely known to belong to any of the above categories, because of lack of information.

 range of several years
 month(s) of maximum RH

12.3.4 free format RH data

13. Socio-management system

13.1 Stationary domicile

13.1.1 extensive management

13.1.1.1 peasant herds

13.1.1.2 commercial ranching

13.1.2 village herds (smallholdings)

13.1.3 intensive management

13.1.3.1 grassland-based

13.1.3.1 arable-associated

13.2 Stationary domicile

13.3 nomadism

[See Glossary for definitions.]

13.4 Free format field for socio-management system

14. Type of farm

14.1 Peasant agriculture

14.2 Breeding centre

14.3 Commercial production unit

14.4 Experiment station

14.5 Field experiment

14.6 Multiplication unit

14.7 Other (specify)

14.8 Free format field for farm type

15. Degree of management supervision

15.1 Advisory services

15.2 Resident professional supervision

15.3 Supervision by scientific staff of investigation project

15.4 None

15.5 Unknown

16. Mating

16.1 Mating methods in herds

16.1.1 bucks continually with does - uncontrolled mating

16.1.2 bucks continually with does but mating prevented except at specified times

16.1.3 bucks separated from does except at specified times

16.1.4 hand mating

16.1.5 AI

fresh semen

frozen semen

fresh and frozen semen

16.1.6 AI followed by natural or hand mating

fresh semen

frozen semen

fresh and frozen semen

16.1.7 other (specify)

17. Herd size

17.1 Number of breeding does

17.2 Number of mated yearling females

17.3 Number of replacement females (weaning to transfer into breeding herd)

17.4 Number of stud bucks

17.5 Number of reserve bucks

17.6 Number of kids (birth to weaning)

17.7 Number of postweaners for meat production

17.8 Percentage of breeding does that are milked annually

18. Nutrition

18.1 Grazing

18.1.1 method

18.1.1.1 zero grazed

18.1.1.2 extensively in a herded group

18.1.1.3 fenced

18.1.1.4 strip grazed

18.1.1.5 other (specify)

18.1.2 pasture classification

18.1.2.1 unimproved

18.1.2.2 improved

18.1.3 water supply of pasture

18.1.3.1 rainfed

18.1.3.2 irrigated

18.1.4 dominant grass species

18.1.4.1 species 1 [give botanical name]

- 18.2 Fodder crops
 - 18.2.1 cut green fodder
 - 18.2.2 hay
 - 18.2.3 silage
 - 18.2.4 other (specify)
 - 18.2.5 free format field for amounts fed
- 18.3 Concentrates
 - 18.3.1 ingredients
 - 18.3.1.1 ingredient 1 [name]
 - % of concentrate diet
 - 18.3.1.2 ingredient 2
 - % of concentrate diet
 -
 -
 -
 - 18.3.1.n ingredient n
 - % of concentrate diet
 - 18.3.2 free format field for amounts of concentrates fed
 - [For 18.2.5 and 18.3.2, as a minimum entry specify whether feeding is ad-lib, or not ad-lib.]
- 18.4 Water
 - 18.4.1 sufficient to meet requirements
 - 18.4.2 supply inadequate
 - [Specify months in which supply is inadequate, e.g. 03 to 05.]
- 18.5 Minerals
 - 18.5.1 supply adequate
 - 18.5.1.1 supplements not fed
 - 18.5.1.2 supplements fed
 - 18.5.2 supply inadequate
 - 18.5.2.1 supplements not fed
 - 18.5.2.2 supplements fed
- 18.6 Seasonality of nutrition
 - 18.6.1 feeding adequate all year round
 - 18.6.2 feeding inadequate in some months (specify)
- 18.7 kid feeding
 - 18.7.1 suckling plus grazing
 - 18.7.2 milk replacer after early weaning
- 18.8 type of weaning
 - 18.8.1 abrupt
 - 18.8.8.1 age at weaning
 - 18.8.2 partial
 - 18.8.2.1 age at start of partial weaning
 - 18.8.2.2 age at end of partial weaning
- 19. Housing
 - 19.1 Provided

- 19.1.1 only at night
- 19.1.2 at night and for part of the day
- 19.1.3 day and night
- 19.1.4 for part of day
- 19.1.5 type of housing (specify)

19.2 not provided

20. Diseases and parasites

[Free format field for noting any diseases prevalent at the time that performance data were recorded.]

21. Measures against diseases and parasites

[Free format field for recording prophylactic measures; in particular, dipping, anthelmintic dosing and vaccination.]

22. Performance

22.1 Body weight

[Give all weights in kg; N = number of observations; SD = standard deviation; males = entire males.]

4.5 Body

4.5.1 backline

- straight
 - swaybacked (i.e markedly convex ventrally)
 - 4.5.2 belly
 - pot (e.g. Vietnamese)
 - not pot-bellied
 - 4.5.3 skin
 - smooth
 - wrinkled
 - 4.5.4 tail
 - straight
 - curly or kinked
- 4.6 Basic temperament
 - males
 - docile
 - moderately tractable
 - wild
 - females
 - docile
 - moderately tractable
 - wild
- 4.7 Conservation status
 - 4.7.1 endangered
 - 4.7.2 vulnerable
 - 4.7.3 rare
 - 4.7.4 indeterminate
 - 4.7.5 out of danger
 - 4.7.6 insufficiently known
 - 4.7.7 not at risk (none.of the above)

The first six of these categories are used by the International Union for the Conservation of Nature and Natural Resources. Their definitions, slightly amended,are as follows.

Endangered.; Breeds in danger of extinction, and whose survival is unlikely if the causal factors continue operating.

Vulnerable: Breeds likely to move into the Endangered category in the near future if the causal factors continue operating.

Rare.: Breeds with small populations that are not at present Endangered or Vulnerable, but are at risk.

Indeterminate; Breeds known to be Endangered, Rare or Vulnerable, but where there is not enough information to say which of the three categories is appropriate.

Out of Danger: Breeds formerly included in one of the above categories, but which are now considered relatively secure because effective conservation measures have been taken or the previous threat to their survival has been removed.

Insufficiently Known: Breeds that are suspected but not definitely known to belong to any of the above categories, because of lack of information.

[free format field; specify comparative incidence and/or mortality.]

GLOSSARY

Management terms

Intensive (pigs)

High input systems characteristic of developed countries.

Nomadism

The system in which the livestock and their owners/herders move from location to location throughout the year, with no single, fixed base.

Semiferal (buffaloes)

As in Borneo. The animals are kept as a capital investment, and are captured and/or killed when cash is required.

Semi-intensive (pigs)

Breeding stock are kept on grass; growing/finishing pigs are in pens/houses.

Transhumance

The system in which the livestock and their owners/herders occupy a home base for a substantial portion of the year, and migrate to other locations for the rest of the year.

Village or smallholder agriculture

Small farms or communally owned lands in close proximity to centres of human population. Generally, farming is both arable and livestock.

Wool

composition

true wool: the undercoat of many breeds, but the whole fleece of the Merino; lacks a medulla, and usually tightly crimped.

heterotypes; intermediate between true wool and kemp; medullated in the widest part of the fibre (summer growth); no medulla in the narrower part of the fibre (winter growth).

kemps: fibres with a diameter of approximately 100 micrometres and a wide medulla.

hair.: medullated for the full length of the fibre, and the medulla occupies .80% of the diameter.

processing type

Merino wool: <23 micrometres in diameter

crossbred wool: any wools other than those of Merino quality used in the manufacture of clothing, furnishings and drapery.

carpet wool: undercoat + heavily medullated heterotypes + kemp; coarser than crossbred wool.

Terrestrial environment (biomes)

Desert biome

Semi-desert: Woody shrubs and grasses. Includes thorn tree semidesert in areas that are transitional to forest. Found in dry climates of the tropics, subtropics and mid latitudes. Large annual soil-water deficit. Mean annual precipitation usually 10-25 cm.

Dry desert: Widely scattered desert shrubs with bare ground intervening. Found in dry desert climate in tropical and mid latitudes. Large soil-water deficit. Mean annual precipitation usually <10 cm.

Grassland biome

Middle latitude grassland: This includes the two types defined below.

Tall-grass prairie: Dense growth of tall grasses and herbs. Found in moist subtropical and moist continental climates. Mean temperature of coldest month <10 C; mean temperature of warmest month >18 C. Mean monthly precipitation >3 cm.

Short grass (steppe): Short sparse grasses. Found in semiarid and subhumid climates of mid-latitude plains. Evaporation exceeds precipitation, on average, throughout the year; no water surplus. Mean annual precipitation usually 25-76 cm.

Forest biome

Coniferous forest = Needleleaf forest defined below.

Mediterranean woodland and scrub: = Sclerophyll forest defined below.

Monsoon forest: Open forest of tropical lands. Many trees are deciduous: shed leaves in the low-sun season. There are dry cool and wet monsoon seasons. Average temperature of every month \Rightarrow 18 C. Rainfall of driest month <6 cm.

Mid-latitude deciduous forest: Broadleaf, deciduous trees which shed leaves in winter. Substantial soil-water surplus. Found in mild, humid (mesothermal) climates and snowy-forest microthermal climates. Average temperature of coldest month <10 C; average of warmest month >18 C.

Needleleaf forest (Coniferous forest): Needleleaf evergreen trees forming dense forest in high latitudes. Long, very cold winters (except on west coast of continents). Average temperature of coldest month <10 C: average of warmest month >18 C.

Sclerophyll forest (Mediterranean woodland and scrub); Open forest of hard-leaved, evergreen trees. Found in mid-latitude regions with very dry summers and moist winters. Precipitation of the driest month of summer <3 cm. Precipitation of the wettest month of winter is at least three times as much as in the driest month of summer.

Tropical deciduous forest = Monsoon forest defined above.

Tropical rainforest: Tall, smooth-barked, evergreen trees with high crowns. Found in warm, wet, equatorial, tropical climates with a large water surplus. Average temperature of every month $\Rightarrow 18$ C. Rainfall of driest month $\Rightarrow 6$ cm.

Tropical scrub forest: Also known as thorn woodland, thorn forest and thorn tree semidesert. The trees and shrubs are deciduous, shedding leaves during the dry season. Examples are the caatinga of northeast Brazil and the dornveldt of South Africa.

Savanna biome

Tropical savanna woodland: Scattered trees with grassland. e.g. orchard bush of West Africa.

Found in tropical climates with a long dry season and a short wet season. Average temperature of every month $\Rightarrow 18$ C. Annual rainfall exceeds annual evaporation; at least one month has less than 6 cm of rain.

Tundra biome

Arctic tundra: Treeless landscape with sedges, grasses, mosses and flowering herbs. Found in the severely cold climate of the subarctic zone. Mean temperature of the warmest month >0 and <10 C.

Alpine tundra: Similar to arctic tundra. Occurs at high altitudes, above the tree line, and in a wide range of latitudes. Climate similar to that of arctic tundra.

FAD TECHNICAL PAPERS

FAD ANIMAL PRODUCTION AND HEALTH PAPERS

- 1. Animal husbandry, selected articles from World Animal Review, 1977 (2^o, 3^o, 4^o, 5^o)
- 2. Evaluation of the feeding and nutrition needs of cattle, 1978 (2^o, 3^o, 4^o)
- 3. Production and application of equipment for better cattle, 1977 (2^o, 3^o)
- 4. New feed ingredients, 1977 (2^o, 3^o)
- 5. Technology of the cattle farms of the Americas, 1977 (2^o)
- 6. Nutrition and health and growth in animal husbandry, 1977 (2^o, 3^o)
- 7. Environmental impact of animal chemical control, 1977 (2^o, 3^o)
- 8. Environmental impact of better chemical control, 1980 (2^o, 3^o)
- 9. Feeding strategy of Mediterranean sheep, 1978 (2^o, 3^o)
- 10. Physiological and environmental aspects and adaptation, 1978 (2^o, 3^o, 4^o)
- 11. Feeding stress for animal feeding, 1978 (2^o, 3^o, 4^o, 5^o)
- 12. Managing storage and distribution of processed milk, 1978 (2^o)
- 13. Nutrient balance, selected articles from World Animal Review, 1978 (2^o, 3^o, 4^o, 5^o)
- 14. Buffers, acidification and artificial insemination, 1978 (2^o)
- 15. The African ruminants, 1978 (2^o, 3^o)
- 16. Establishment of dairy feeding systems, 1978 (2^o)
- 17. Open herd feeding for young cattle, 1981 (2^o, 3^o, 4^o, 5^o)
- 18. Protein nutrition studies, 1980 (2^o)
- 19. New feed sources and uses of knowledge, 1980 (2^o)
- 20. New feed sources and animal production systems, 1980 (2^o)
- 21. Environmental conditions in feed and genetic stress, 1980, Vol. 1 - Genetic study (2^o, 3^o)
- 22. Environmental conditions in feed and genetic stress, 1980, Vol. 2 - Genetic studies (2^o, 3^o)
- 23. Studies for dairy improvement, 1980 (2^o)
- 24. Genetic genetic resources in America (Latin America), 1980 (2^o)
- 25. Genetic control in animal and agriculture (2^o, 3^o, 4^o)
- 26. Animal genetic resources - conservation and management, 1980 (2^o)
- 27. Reproductive efficiency in cattle, 1980 (2^o)
- 28. Cattle and dairy milk, 1980 (2^o)
- 29. Dairy farming, 1980 (2^o)
- 30. Feed Ruminant animal husbandry manual, 1980 (2^o)
- 31. Environmental conditions, nutritional, physiological and control, FAO/UNEP/WHO guidelines, 1980 (2^o)
- 32. Stress and milk yields of cattle, 1980 (2^o)
- 33. Management of animal production, 1980 (2^o)
- 34. Crop residues and agro-industry by-products in animal feeding, 1980 (2^o)
- 35. Environmental requirements, 1980 (2^o, 3^o)
- 36. Feeding stress for ruminant husbandry in the tropics, 1980 (2^o, 3^o)
- 37. Problems in milk and non-milked milk, 1980 (2^o, 3^o, 4^o)
- 38. Milk and the better proteins, selected articles from World Animal Review, 1980 (2^o, 3^o, 4^o)
- 39. Animal genetic improvement, selected articles from World Animal Review, 1980 (2^o, 3^o, 4^o)
- 40. Diagnostics and laboratory for the control of diseases in the Near East, 1980 (2^o)
- 41. Dairy change in animal husbandry and production, 1980 (2^o)
- 42. Domestic animal production in the Near East, 1980 (2^o)
- 43. Managing crop and livestock in these areas, 1980 (2^o)
- 44. Animal change in agriculture in Africa and Asia, 1980 (2^o, 3^o)
- 45. Dairy improvement for animal husbandry, 1980, Vol. 1 (2^o, 3^o, 4^o)
- 46. Animal genetic resources conservation in Transhumant, Milk Farms and Farming, 1980 (2^o)
- 47. Animal genetic resources: comparative studies of perception and molecular engineering, 1980 (2^o)
- 48. Management systems for the dairy sector, 1980 (2^o)
- 49. Livestock breeds of China, 1980 (2^o)
- 50. Management in the 80's in terms of organization and technology, 1980 (2^o)
- 51. La Technologie de la culture de légumes et techniques de gestion, 1980 (2^o)
- 52. Manual for diagnosis of animal husbandry in developing countries, 1980 (2^o)
- 53. Better utilization of crop residues and by-products in animal feeding, research guidelines, 2. State of knowledge, 1980 (2^o)
- 54. Better utilization of crop residues and by-products in animal feeding, research guidelines, 2. 2. Practical manual for research methods, 1980 (2^o)
- 55. Small ruminant husbandry, strategies and perspectives, 1980 (2^o)
- 56. Small ruminant production, 1980 (2^o)
- 57. Sub-Saharan, changing and perspectives, 1980 (2^o)
- 58. Small ruminants in the Near East, Vol. 1 (2^o)
- 59. Selected papers presented at Tunis Expert Consultation
- 60. Small ruminants in the Near East, Vol. 2 (2^o)
- 61. Selected papers from World Animal Review
- 62. Sheep and goats in Pakistan, 1980 (2^o)
- 63. Sheep stress, 1980 (2^o)
- 64. Small ruminant production in the developing countries, 1980 (2^o)
- 65. Animal genetic resources data tables, 1980 (2^o)
 - 1. Comparative research study for ruminant data tables
 - 2. Animal genetic resources data tables, 1980 (2^o)
 - 3. Diagnostic keys for cattle, buffalo, sheep, goats and goats
- 66. Animal genetic resources data tables, 1980 (2^o)
 - 1. Diagnostic keys for poultry
- 67. Sheep and goats in Turkey, 1980 (2^o)
- 68. The Palestinian farms and organization in the National Institute in Ramallah, 1980 (2^o)
