Agenda Item 16 (e)

CX/FAC 05/37/25-Add. 1

April 2005

**ORIGINAL LANGUAGE ONLY**

**JOINT FAO/WHO FOOD STANDARDS PROGRAMME**

**CODEX COMMITTEE ON FOOD ADDITIVES AND CONTAMINANTS**

**Thirty-seventh Session**

**The Hague, the Netherlands, 25 – 29 April 2005**

**DEOXYNIVALENOL (DON) CONTAMINATION IN CEREALS**

**(INFORMATION SUBMITTED IN RESPONSE TO CL 2004/9-FAC)**

The following comments have been received from Cuba, European Community, Japan and USA

**Cuba:**

We appreciate and are looking forward to the information that the European Union and Japan will put forward at the next session; meanwhile Cuba thinks that a maximum level of 1 mg/kg would be appropriate in both wheat and cereals in general, except for cereal products for infants.

**European Community:**

Information on deoxynivalenol (DON) Contamination in cereals from the European Community is contained in document CX/FAC 05/37/25. It was further mentioned that the EC would be able to provide in advance of the meeting information on maximum levels, sampling procedures and methods of analysis for consideration at the 37<sup>th</sup> session of CCFAC

Please find enclosed information on maximum levels, sampling procedures and methods of analysis. These measures will be adopted by the European Commission very shortly and will become applicable in the European Community from 1 July 2006 onwards.

**MAXIMUM LEVELS FOR DEOXYNIVALENOL**

| Product (1)                                                                  | Maximum level (µg/kg) |
|------------------------------------------------------------------------------|-----------------------|
| Unprocessed cereals (2) other than durum wheat, oats and maize               | 1250                  |
| Unprocessed durum wheat and oats                                             | 1750                  |
| Unprocessed maize                                                            | - (3)                 |
| Cereal flour, including maize flour, maize grits and maize meal (4)          | 750                   |
| Bread, pastries, biscuits, cereal snacks and breakfast cereals               | 500                   |
| Pasta (dry)                                                                  | 750                   |
| Processed cereal-based food for infants and young children and baby food (5) | 200                   |

(1) For the purpose of the application of maximum levels of deoxynivalenol, rice is not included in cereals” and rice products not included in “cereal products”

(2) The maximum levels set for “unprocessed cereals” applies to cereals placed on the market for first-stage processing.

“First-stage processing” shall mean any physical or thermal treatment, other than drying, of or on the grain. Cleaning, sorting and drying procedures are not considered to be “first stage processing” insofar no physical action is exerted on the grain kernel itself and the whole grain remains intact after cleaning and sorting.

(3) If no specific level is fixed before 1 July 2007, the level of 1750 µg/kg will apply thereafter to maize referred to in this point.

(4) This category includes also similar products otherwise denominated such as semolina.

(5) The maximum level for processed cereal-based foods for infants and young children and baby food refers to the dry matter.

**SAMPLING PROCEDURE FOR THE OFFICIAL CONTROL OF DEOXYNIVALENOL**

1. Different types of lots

Food commodities may be traded in bulk, containers, or individual packings, such as sacks, bags, retail packings. The sampling procedure may be applied to all the different forms in which the commodities are put on the market.

The following formula may be used as a guide for the sampling of lots traded in individual packs, such as sacks, bags, retail packings.

$$\text{Sampling Frequency (SF) } n = \frac{\text{Weight of the lot} \times \text{Weight of the incremental sample}}{\text{Weight of the aggregate sample} \times \text{Weight of individual packing}}$$

- weight: in kg

- sampling frequency (SF): every nth sack or bag from which an incremental sample must be taken (decimal figures should be rounded to the nearest whole number).

2. Weight of the incremental sample

The weight of the incremental sample must be about 100 grams. In the case of lots in retail packings, the weight of the incremental sample shall depend on the weight of the retail packing.

3. Sampling procedure for cereals and cereal products3.1. Subdivision of lots into sublots depending on product and lot weight

| Commodity                   | Lot weight (ton) | Weight or number of sublots | No incremental samples | Aggregate sample Weight (kg) |
|-----------------------------|------------------|-----------------------------|------------------------|------------------------------|
| Cereals and cereal products | ≥1 500           | 500 tonnes                  | 100                    | 10                           |
|                             | >300 and < 1 500 | 3 sublots                   | 100                    | 10                           |
|                             | ≥ 50 and ≤ 300   | 100 tonnes                  | 100                    | 10                           |
|                             | < 50             | --                          | 3-100*                 | 1-10                         |

\* Depending on the lot weight

3.2. Sampling procedure for cereals and cereal products for lots ≥ 50 tonnes

- On condition that the subplot can be separated physically, each lot must be subdivided into sublots following the table under 3.1. Taking into account that the weight of the lot is not always an exact multiple of the weight of the sublots, the weight of the subplot may exceed the mentioned weight by a maximum of 20 %.

- Each subplot must be sampled separately.

- Number of incremental samples: 100. Weight of the aggregate sample = 10 kg

- If it is not possible to carry out the method of sampling set out in this point because of the commercial consequences resulting from damage to the lot such as packaging forms, means of transport, an alternative method of sampling may be applied provided that it is as representative as possible and is fully described and documented.

3.3. Sampling provisions for cereals and cereal products for lots < 50 tonnes

For lots of cereals and cereal products less than 50 tonnes, the sampling plan must be used with 10 to 100 incremental samples, depending on the lot weight, resulting in an aggregate sample of 1 to 10 kg. For very small lots (≤ 0.5 tonnes) a lower number of incremental samples may be taken, but the aggregate sample uniting all incremental samples shall be also in that case at least 1 kg.

The figures in the table below may be used to determine the number of incremental samples to be taken.

Table: Number of incremental samples to be taken depending on the weight of the lot of cereals and cereal products

| Lot weight (tonnes) | No of incremental samples |
|---------------------|---------------------------|
| ≤ 0.05              | 3                         |
| > 0.05 - ≤ 0.5      | 5                         |
| > 0.5 - ≤ 1         | 10                        |
| > 1 - ≤ 3           | 20                        |
| > 3 - ≤ 10          | 40                        |
| > 10 - ≤ 20         | 60                        |
| > 20 - ≤ 50         | 100                       |

### 3.4 Sampling procedure for foods intended for infants and young children

- The sampling procedure for cereals and cereal products as set out in point 3.3 shall apply to food intended for infants and young children. Accordingly the number of incremental samples to be taken shall depend on the weight of the lot, with a minimum of 10 and a maximum of 100, in accordance with the table under point 3.3. For very small lots ( $\leq 0.5$  tonnes) a lower number of incremental samples may be taken, but the aggregate sample uniting all incremental samples shall be also in that case at least 1 kg.
- weight of the incremental sample must be about 100 grams. In the case of lots in retail packing, the weight of the incremental sample shall depend on the weight of the retail packing and in case of very small lots ( $\leq 0.5$  tonnes) the incremental samples must have a weight as such that uniting the incremental samples results in an aggregate sample of at least 1 kg..
- weight of aggregate sampling = 1-10 kg sufficiently mixed.

### 3.5 Sampling at retail stage

Sampling of foodstuffs at the retail stage must be done where possible in accordance with the sampling provisions set out in points 3.2. and 3.3. Where that is not possible, other effective sampling procedures at retail stage may be used provided that they ensure sufficient representativeness for the sampled lot.

### 4. Acceptance of a lot or subplot

- acceptance if the aggregate sample conforms to the maximum limit, taking into account the measurement uncertainty and correction for recovery,
- rejection if the aggregate sample exceeds the maximum limit beyond reasonable doubt taking into account the measurement uncertainty and correction for recovery.

## **SAMPLE PREPARATION AND CRITERIA FOR METHODS OF ANALYSIS TO BE USED FOR THE OFFICIAL CONTROL OF DEOXYNIVALENOL**

### 1. Precautions

As the distribution of Fusarium toxins is non-homogeneous, samples shall be prepared, and in particular homogenised samples, with extreme care.

All the material received by the laboratory must be used for the preparation of test material.

### 2. Treatment of the sample as received in the laboratory

Each laboratory sample must be finely grinded and mixed thoroughly using a process that has been demonstrated to achieve complete homogenisation.

In case the maximum level applies to the dry matter, the dry matter content of the product shall be determined on a part of the homogenised sample, using a procedure that has been demonstrated to determine accurately the dry matter content.

### 3. Subdivision of samples for enforcement and defence purposes

The replicate samples for enforcement, trade (defence) and referee purposes shall be taken from the homogenised material unless such procedure conflicts with Member States' rules on sampling

#### 4. Method of analysis to be used by the laboratory and laboratory control requirements

##### 4.1. Definitions

A number of the most commonly used definitions that the laboratory shall be required to use are the following:

The most commonly quoted precision parameters are repeatability and reproducibility.

$r$  = Repeatability, the value below which the absolute difference between two single test results obtained under repeatability conditions, namely same sample, same operator, same apparatus, same laboratory, and short interval of time may be expected to lie within a specific probability (typically 95%) and hence  $r = 2.8 \times s_r$ .

$s_r$  = Standard deviation, calculated from results generated under repeatability conditions.

$RSD_r$  = Relative standard deviation, calculated from results generated under repeatability conditions  $[(s_r / \bar{x}) \times 100]$ .

$R$  = Reproducibility, the value below which the absolute difference between single test results obtained under reproducibility conditions, namely on identical material obtained by operators in different laboratories, using the standardised test method may be expected to lie within a certain probability (typically 95%);  $R = 2.8 \times s_R$ .

$s_R$  = Standard deviation, calculated from results under reproducibility conditions.

$RSD_R$  = Relative standard deviation calculated from results generated under reproducibility conditions  $[(s_R / \bar{x}) \times 100]$ .

##### 4.3. Performance Criteria

| Level<br>µg/kg | Deoxynivalenol |           |            |
|----------------|----------------|-----------|------------|
|                | $RSD_r$ %      | $RSD_R$ % | Recovery % |
| > 100 - ≤ 500  | ≤ 20           | ≤ 40      | 60 to 110  |
| > 500          | ≤ 20           | ≤ 40      | 70 to 120  |

The detection limits of the methods used are not stated as the precision values are given at the concentrations of interest

The precision values are calculated from the Horwitz equation:

$$RSD_R = 2^{(1-0.5\log C)}$$

where:

$RSD_R$  is the relative standard deviation calculated from results generated under reproducibility conditions  $[(s_R / \bar{x}) \times 100]$

$C$  is the concentration ratio (i.e. 1 = 100g/100g, 0.001 = 1,000 mg/kg)

That is a generalised precision equation, which has been found to be independent of analyte and matrix but solely dependent on concentration for most routine methods of analysis.

#### 4.4. Recovery calculation and reporting of results

The analytical result must be reported corrected or uncorrected for recovery. The manner of reporting and the level of recovery must be reported. The analytical result corrected for recovery shall be used for checking compliance

The analytical result must be reported as  $x \pm U$  whereby  $x$  is the analytical result and  $U$  is the expanded measurement uncertainty.

$U$  is the expanded uncertainty, using a coverage factor of 2 which gives a level of confidence of approximately 95%.”

#### **Japan:**

The 36<sup>th</sup> Codex Committee on Food Additives and Contaminants (CCFAC) agreed to discontinue the consideration of the maximum levels of deoxynivalenol (DON) and to request information on the occurrence of DON in cereals *etc.* On the basis of this agreement, we submit the results of surveillances (surveillance 1 and 2) on DON in wheat grains and flours to facilitate discussion at the 37<sup>th</sup> CCFAC.

The Government of Japan has introduced the provisional maximum level of DON for husked wheat at 1.1 mg/kg in May 2002. The reduction of DON level in wheat flour in 2003 (surveillance 2) may be attributed to the introduction of this provisional standard.

#### Surveillance 1

The surveillance 1 was carried out in Japan from 2003 to 2004. DON was extracted from comminuted husked wheat grains, which were domestically produced, by shaking them in a mixture of acetonitrile and water (85:15) and analyzed with HPLC/MS. The analytical results are summarized in Table 1.

#### Surveillance 2

The surveillance 2 was conducted for husked wheat (in 2001-2002) and for wheat flour (in 2002-2003). The samples were collected within the country and may include both domestic and imported products. DON was extracted from the samples using acetonitrile:water (85:15) solution and analyzed by GC/MS and LC/MS after one-step solid phase extraction clean up procedure. The results are shown in Table 2 and Figure 1 - 4.

**Table 1. Aggregated Data on DON Levels in Domestically Produced Wheat Grains (Surveillance 1)**

| Field number | Short field name | Descriptive field name              | Data            |

**USA:**

This responds to CL 2004/9-FAC which requests information on: the occurrence of deoxynivalenol in cereals; the influence of processing, decontamination, sorting, etc. to lower the level of DON in a lot; national levels or guideline levels for DON; sampling procedures and methods of analysis; etc. for consideration by the next Session of the Committee. The United States of America appreciates the opportunity to provide the following comments for consideration at the forthcoming 37<sup>th</sup> Session of the Codex Committee on Food Additives and Contaminants (CCFAC).

At the 36<sup>th</sup> Session of the CCFAC (Rotterdam, The Netherlands, 22-26 March 2004) the Committee agreed to request information on the occurrence of deoxynivalenol in cereals for consideration by the next Session of the Committee (ALINORM 04/27/12, § 158).

The United States (U.S.) is pleased to submit at this time data on the occurrence of deoxynivalenol in raw barley (Table 1) and raw wheat (Table 2) crops in the United States. In the near future, we hope to provide the CCFAC with comprehensive data on the effects of various processing procedures on the level of DON contamination in cereals.

<sup>1</sup> These are commercial crop samples; sampling plan and sampling was done by government officials and analyzed in a State University laboratory. The samples were analyzed by GC-ECD; the limit of quantitation was 0.49 mg/kg.

<sup>2</sup> Number in parenthesis refers to percent.

<sup>3</sup> Samples collected and analyzed by HPLC in industrial food laboratories. Limit of quantitation 100 ng/g.
