

PHOSMET (103)

*First draft prepared by Dugald MacLachlan, Australian Quarantine and Inspection Service,
Department of Agriculture, Forestry and Fisheries, Kingston, Australia*

EXPLANATION

Phosmet was first evaluated in 1976, and most recently in 1997 for residues and in 1998 for toxicology (acute RfD). The 1997 JMPR recommended the withdrawal of the existing CXLs for, among other crops, blueberries, citrus fruits, nectarines, pears and potatoes. The 31st CCPR (1999) decided to retain the CXLs for four years under the Periodic Review Programme as the Committee was informed that information would be reported to support recommendations for all crops except feijoa and kiwifruit. Data to support the existing CXLs for blueberries, citrus fruits, pear, nectarines and tree nuts and other critical data required for the estimation of maximum residue levels were provided by the manufacturer.

The governments of Australia and The Netherlands reported information on national GAP and/or residue data.

RESIDUE ANALYSIS

No new information on methods of analysis was provided.

USE PATTERN

The information available to the Meeting on registered uses is summarized in Table 1.

Table 1. Registered uses of phosmet (pre-harvest, WP formulations).

Crop	Country	Application				PHI (days)
		Method	Rate (kg ai/ha)	Spray conc. (kg ai/hl)	No.	
Almonds	USA	Foliar	3.4 – 4.2		2	30
Blueberries	Canada	Foliar	1.1	0.11	1-2	15
Blueberries	USA	Foliar	1		1-2	3
Citrus	Argentina	Applied as a bait		0.06		
Citrus	Spain	Foliar		0.075-0.13		30
Citrus (orange, grapefruit), Florida only	USA	Foliar	0.8 – 1.6		5	7
Nectarine	Chile	Foliar	-	0.05-0.06		14
Nectarines	USA	Foliar	1.7 – 3.3			14
Pear	Canada	Foliar	1.9			1
Pear	Chile	Foliar	-	0.075-0.09		7
Pears	USA	Foliar	1.7 – 5.6	0.025-0.05		7

Crop	Country	Application				PHI (days)
		Method	Rate (kg ai/ha)	Spray conc. (kg ai/hl)	No.	
Pecans	USA	Foliar	1.6 – 2.5	0.05		14 ¹
Pistachios	USA	Foliar	3.4 – 4.4			14 ² CA only (before 10% hull split)
Pistachios	USA	Dormant spray	2.4-3.4			7 CA only
Walnuts, Filberts and other nuts	USA	Foliar	3.4 – 6.7		max. 5	14; (not after hull split)

¹ Do not graze or feed livestock on cover crops grown in treated pecan groves

² Do not graze or feed livestock on cover crops grown in treated pistachio groves

RESIDUES RESULTING FROM SUPERVISED TRIALS

The results of the residue trials are shown in Tables 2-13 and are reviewed in order of the Codex Alimentarius Classification of Foods and Animal Feeds.

Table 2	<i>Oranges.</i>
Table 3	<i>Mandarins.</i>
Table 4	<i>Grapefruit.</i>
Table 5	<i>Lemons.</i>
Table 6	<i>Pears.</i>
Table 7	<i>Nectarines.</i>
Table 8	<i>Blueberries.</i>
Table 9	<i>Almonds.</i>
Table 10	<i>Hazelnuts.</i>
Table 11	<i>Pecans.</i>
Table 12	<i>Pistachios.</i>
Table 13	<i>Walnuts.</i>

Where residues were not detected the results are reported as below the limit of quantification (LOQ), e.g. <0.05 mg/kg. Residues, application rates and spray concentrations have generally been rounded to 2 significant figures. Although trials included results for untreated controls, these results are not reported in the Tables unless the residues in the control samples were above the LOQ. The prefix “c” in the Tables indicates samples from control plots. Analyses of replicate field samples from one plot or from duplicate plots in one trial are shown separately. Double-underlined residues are from treatments according to GAP and were used to estimate maximum residue levels. Whenever possible residues are recorded uncorrected for analytical recoveries. It should be noted that unless stated otherwise concurrent recoveries were acceptable and corrections would not be significant.

Citrus fruit

Trials were on oranges, mandarins, grapefruit and lemons (Tables 2–5).

Oranges. Reported concurrent recoveries were 70-104% phosmet, 70-110% oxon, both generally >80%.

Table 2. Residues of phosmet in oranges after foliar applications of various formulations.

FATE OF RESIDUES IN STORAGE AND PROCESSING

In processing

Oranges. 453-544 kg of Navel oranges from two plots in Dinuba, California, treated with three WP applications of phosmet at 17 kg ai/ha (66 trees/plot, A-5326) or 17 kg ai/ha plus summer oil (61 trees/plot, A-5328) harvested 7 days after the last spray were sent for commercial processing (McAfee, 1972). The process is shown in Figure 1.

Figure 1. Commercial processing of oranges.

Table 14. Phosmet residues in oranges and processed fractions, with processing factors (McAfee, 1972).

Sample	3×17 kg ai/ha + summer oil (A5328)			3×17 kg ai/ha (A5226)		
	Phosmet	Oxon	PF (phosmet)	Phosmet	Oxon	PF (phosmet)
Fruit	1.2, 0.85, 0.89	0.22, 0.22, 0.13		1.3, 1.1, 1.0	<0.05 (3)	-
Washed fruit	0.23, 0.21, 0.23	0.18, 0.14, 0.09	0.23	0.13, 0.10, 0.12	<0.05 (3)	0.10

Oil	2.9, 5.4	0.07, 0.07	4.3	2.4, 2.5	<0.05, 0.05	2.2

Residues are for replicate collected samples

The mean processing factors were 0.17 for washed fruit, 0.19 for peel, <0.05 for dry pulp, <0.05 for molasses, <0.05 for juice and 3.3 for oil.

NATIONAL MAXIMUM RESIDUE LIMITS

The definition of the residue for phosmet in Australia is the sum of phosmet and its oxygen analogue, expressed as phosmet.

The Meeting was informed that the following national MRLs were established:

Country	Commodity	MRL (mg/kg)
Australia	Cattle, edible offal, cattle fat, cattle meat, milk, stone fruit	1
	Cereal grains, goat edible offal, goat meat, pig edible offal, pig meat, sheep edible offal, sheep meat	0.1
Austria	Kiwifruit, pome fruit	1
	Peas, potatoes, sugar beets	0.1
	Rape seed	0.5
Belgium	Citrus fruit	5
	Kiwifruit	10
	Pome fruit	1
	Potatoes	0.1
Brazil	Apples, peaches, pears, quince	1
	Citrus fruit	5
	Cotton seed	0.1
Canada	Apples, grapes, peaches, pears	10
	Blueberries, plums	5
	Cherries	7
	Kiwifruit	1
China	Tea	0.5
Czech Republic	Alfalfa	40
	Apples, grapes, maize silage, whortleberries	10
	Apricots, citrus fruit, nectarines	5
	Cattle fat	1
	Maize, sweet corn, nuts, potatoes	0.1
	Milk, peas	0
EEC	Tea	0.1
Finland	Citrus fruit	5
	Kiwifruit	10
France	Kiwifruit	10
	Pome fruit	2
Germany	Kiwifruit	15
	Pome fruit	2
	Rape seed	0.5
	Potato, sugar beet	0.1
Hungary	All food crops	2
Iceland	Kiwifruit	5
	Pome fruit	0.2
	Tea	0.1
Israel	Cattle fat	1
	Milk	0
Italy	Apples, apricots, cherries, citrus fruit, olives, peaches, plums	0.6
	Potatoes	0.1
Japan	Pulses, rice	0.1
	Summer orange, exocarp	2
	Tea	0.5
	Vegetables	0.1
Kenya	Alfalfa	40
	Apples, blueberries, grapes, maize forage/fodder, peaches, pears, pea hay/fodder, sweet potatoes	10
	Apricots, citrus fruits, nectarines	5
	Cattle meat	1
	Feijoa	2

Country	Commodity	MRL (mg/kg)
	Kiwifruit	15
	Maize, sweet corn, nuts, potatoes, tea	0.1
	Milk	0
	Peas	0.2
Korea	Cattle meat	1
Malaysia	Apples, apricots, cherries, nectarines, peaches, pears, plums	1
	Peas, rice	0.1
	Maize, sweet corn	0.2
	Kiwifruit	1.5
Netherlands	Bilberry, sweet potatoes	10
	Cattle meat, milk, nuts, potatoes	0.1
	Citrus fruit	5
	Kiwifruit	15
	Peas	0.2
New Zealand	Kiwifruit	15
Singapore	Apples, berry fruit, grapes, peaches, pears, sweet potatoes	10
	Cattle fat	1
	Citrus fruit, forage crops, dry, nectarines	5
	Kiwifruit	15
	Maize, sweet corn	0.2
	Milk	0
	Peas, pig meat, potatoes	0.1
Slovak Republic	Bilberry, sweet potatoes	10
	Cattle meat	1
	Citrus fruit	5
	Kiwifruit	15
	Maize, sweet corn, nuts, peas, potatoes	0.1
Spain	Berry fruits, nuts, small fruits, stone fruit	2
	Brassica vegetables, bulb vegetables, leafy vegetables, legumes, potatoes, root and tuber vegetables, sugar beets, tea	0.1
	Citrus fruits	5
	Maize, sweet corn, sorghum	0.2
Switzerland	Citrus fruit	5
	Kiwifruit	15
	Peas, potatoes	0.1
	Stone fruit	1
Taiwan	Citrus fruit, root and tuber vegetables	0.5
	Fruiting vegetables, leafy vegetables, melons, peas, rice	1
Yugoslavia	Fruits, grapes	0.5
	Potatoes	0.1

APPRAISAL

Phosmet (*O,O*-dimethyl *S*-phthalimidomethyl phosphorodithioate) was evaluated under the periodic review in 1994 for toxicology and in 1997 for residues. The 1997 JMPR agreed to withdraw previous recommendations for blueberries, citrus fruits, nectarines, pears and tree nuts, among others. The 31st CCPR (1999) decided to retain the CXLs under the periodic review procedure.

The Meeting received information on phosmet national registered use patterns, supervised residue trials and fate of residues in processing and national MRLs.
Supervised trials

Supervised trials were available for the use of phosmet on many crops: citrus (oranges, mandarins, lemons, grapefruit), pears, nectarines, blueberries and tree nuts (almonds, hazelnuts, walnuts, pistachios and pecans).

Citrus. Phosmet is registered in the USA for use on oranges and grapefruit in Florida at 0.8-1.6 kg ai/ha with a PHI of 7 days. None of the USA trials matched GAP.

GAP was reported by the 1997 JMPR for the use of phosmet on citrus in Argentina. Application is at a spray concentration of 0.06 kg ai/hl with no harvest interval specified. None of the Argentina trials matched GAP in Argentina.

Phosmet is registered in the Spain for use on citrus fruits at 0.075-0.125 kg ai/hl with a PHI of 30 days. The residues resulting from Spain trials meeting those conditions were: mandarins/tangerines 0.09, 0.47, 0.61, 0.67, 0.90, 1.0, 1.4, 1.5 and 1.6 mg/kg; oranges 0.05, 0.10, 0.32, 0.36, 0.57, 0.73 and 1.8 mg/kg. Residues from the two fruits appear to be from the same population and may be evaluated together. Phosmet residues in citrus from 16 trials matching GAP in the Spain in rank order (median underlined) were: 0.05, 0.09, 0.10, 0.32, 0.36, 0.47, 0.57, 0.61, 0.67, 0.73, 0.90, 1.0, 1.4, 1.5, 1.6 and 1.8 mg/kg.

The Meeting estimated a maximum residue level and STMR value for phosmet in citrus fruits of 3 and 0.64 (whole fruit) mg/kg, respectively. The estimated maximum residue level of 3 mg/kg for citrus fruits replaces the previous recommendation for withdrawal.

Four orange and four mandarin samples from the trials were peeled and residues were measured in the peeled fruit. Residues in the peeled oranges (pulp) were 0.09, 0.15 and 0.52 mg/kg (whole oranges 0.41, 0.57, 0.73 and 1.8 mg/kg). In peeled mandarins the residues of phosmet were 0.12, 0.21, 0.30, 0.33 mg/kg (whole mandarins 0.90, 1.4, 1.4 and 1.6 mg/kg). As residues from the two fruits appear to be from the same population they may be evaluated together. The residues in peeled oranges and mandarins were (median underlined) 0.09, 0.12, 0.15, 0.21, 0.30, 0.33 and 0.52 mg/kg.

The Meeting estimated STMR and HR values for phosmet in citrus edible portion of 0.21 and 0.52 mg/kg, respectively.

Pears. The trials from Chile (0.75-0.9 kg ai/hl, PHI 7 days) and the UK (no GAP) did not match GAP and trials from these countries were not evaluated further. The Canadian trials did not match the GAP of that country and were evaluated against GAP in the USA. One of the Canada trials matched GAP in the USA, however the residue in the untreated control (0.22 mg/kg) was more than 10% of the treated sample (0.84 mg/kg). This trial was not used to estimate a maximum residue level.

In the US phosmet is registered for use on pears at 1.7-5.6 kg ai/ha or at a spray concentration of 0.025-0.05 kg ai/hl and with a PHI of 7 days. Residues of phosmet in pears in rank order (median underlined) were: 1.3, 1.7 and 1.8 mg/kg in pears for 3 trials in the USA matching US GAP.

The 1997 estimated a maximum residue level for apples based on GAP in the USA (1.7-4.1 kg ai/ha; PHI 7 days). The residues in apples approximating GAP, in rank order, were: 1.8, 1.8, 2.8, 3.3, 3.4, 3.4, 3.7, 4.2, 4.3 and 7.3 mg/kg. The current Meeting considered that the residues in apples and pears could be combined for the purposes of estimating a maximum residue level and decided to pool the data to estimate a pome fruit maximum residue level, residues in rank order (median underlined): 1.3, 1.7, 1.8 (3), 2.8, 3.3, 3.4, 3.4, 3.7, 4.2, 4.3 and 7.3 mg/kg.

The Meeting estimated a maximum residue level, an STMR and an HR value for phosmet in pome fruits of 10, 3.3 and 7.3 mg/kg, respectively. The estimated maximum residue level of 10 mg/kg for pome fruits replaces the previous recommendation for apples of 10 mg/kg.

Nectarines. Data on nectarines from Chile did not approximate GAP for that country (spray concentration 0.05-0.06 kg ai/ha; PHI 14 days) and were not further evaluated.

US GAP permits phosmet application on nectarines at 1.7-3.3 kg ai/ha with harvest 14 days after the final application. A single trial in the USA was conducted according to GAP and had a residue of 0.55 mg/kg in whole fruit. The number of trials is insufficient to estimate an MRL, STMR or HR for phosmet on nectarines.

The Meeting noted that the GAP reported for peaches in the evaluation by the 1997 JMPR was the same as for nectarines and agreed that the residue trials reported for peaches and apricots by the 1997 JMPR could be used to support a recommendation for a maximum residue level for nectarines. The residues of phosmet in trials on peaches, nectarines and apricots according to GAP were (median underlined): 0.45, 0.55, 0.87, 1.2, 1.5, 1.6, 2.9, 4.2, 4.7, 6.4 and 6.8 mg/kg. The Meeting recommended a maximum residue level, an STMR and an HR value for phosmet in nectarines of 10, 1.6 and 6.8 mg/kg, respectively, the same as for peaches. The estimated maximum residue level of 10 mg/kg for nectarines replaces the previous recommendation for withdrawal.

Blueberries. US GAP permits application of phosmet to blueberries at a 1 kg ai/ha and harvest 3 days after the final application. In 9 trials in the USA in matching the application rate and with PHIs of 3-4 days, phosmet residues in rank order (median underlined, residues from replicate analyses averaged) were: 1.0, 2.4, 3.4, 3.7, 4.0, 4.0, 5.8, 6.6 and 9.9 mg/kg.

The Meeting estimated a maximum residue level, an STMR value and an HR value for phosmet in blueberries of 15, 4.0 and 9.9 mg/kg, respectively. The estimated maximum residue level of 15 mg/kg for blueberries replaces the previous recommendation for withdrawal.

Tree nuts. The commodity to which the MRL applies in the case of tree nuts is the nutmeat. For phosmet the residue is essentially located in the hulls and shell. The meeting was of the opinion that residues in the nut arise as a result of contamination during processing to extract the nutmeat. In this case, the interval between the last spray and harvest is not as important as for other crops and the Meeting decided to only consider the application rate in deciding whether or not trials matched GAP.

Phosmet is registered in the USA for use on almonds at 3.4-4.2 kg ai/ha with harvest permitted 30 days after the final application. In one of the trials that matched GAP, significant residues were reported in the untreated control sample of hulls though residues in the control nutmeat samples were all <LOQ for the same trial. The Meeting considered that as residues in nutmeat were below the LOQ for this trial that they could be used to estimate a maximum residue level. Phosmet residues in almond nutmeat from 4 trials that approximated GAP (median underlined) were: <0.05 (2), 0.05 and 0.07 mg/kg at 21-40 days after application at 3.4-4.5 kg ai/ha.

None of the US trials of hazelnuts matched US GAP.

Phosmet is registered in the USA for use on pecans at 1.6-2.45 kg ai/ha or at a spray concentration of 0.05 kg ai/hl with harvest permitted 14 days after the final application. Phosmet residues in pecan nutmeat were <0.05 (2), and 0.09 mg/kg at 14-15 days after application at 1.6-2.0 kg ai/ha.

Phosmet is registered in the USA for use on pistachios at 3.4-4.4 kg ai/ha with harvest permitted 14 days after the final application. Phosmet residues in pistachio nutmeat were <0.05 (4) mg/kg at 14-15 days after application at 4.5 kg ai/ha.

Phosmet is registered in the USA for use on walnuts at 3.4-6.7 kg ai/ha with harvest permitted 14 days after the final application. Phosmet residues in walnut nutmeat were <0.05 mg/kg in a single trial that matched USA GAP.

The Meeting agreed that the residues found in nutmeat from the various tree nuts were consistent and that a group MRL could be estimated by combining the available data. Phosmet residues in tree nuts (median underlined) were <0.05 (7), 0.05, 0.06, 0.07 and 0.09 mg/kg.

The Meeting estimated a maximum residue level, an STMR value and an HR value for phosmet in tree nuts of 0.2, 0.05 and 0.09 mg/kg, respectively noting the possibility for contamination during processing. The estimated maximum residue level of 0.2 mg/kg for tree nuts replaces the previous recommendations for withdrawal.

Processing

The meeting received information on the fate of incurred residues of phosmet residues during the processing of oranges. Processing factors were calculated for processed commodities derived from these raw agricultural commodities. When residues in the processed commodity did not exceed the LOQ the processing factor was calculated from the LOQ and was prefixed with a 'less than' symbol (<).

The phosmet processing factors for oranges to juice and dried pulp were <0.05 and <0.05 respectively. These factors applied to the STMR (0.64 mg/kg) and MRL (3 mg/kg) for citrus whole fruit provide the STMR-P for orange juice (0.03 mg/kg) and STMR-P for dried processed citrus pulp (0.03 mg/kg).

FURTHER WORK OR INFORMATION

Desirable

RECOMMENDATIONS

On the basis of the data from supervised trials the Meeting concluded that the maximum residue levels listed below are suitable for establishing maximum residue limits and for IEDI assessment.

Definition of the residue (for compliance with MRLs and for estimation of dietary intake): phosmet.

Commodity		MRL	mg/kg	STMR or STMR-P	HR or HR-P
CCN	Name	New	Previous		
FP 0226	Apple	W	10		
FB 0020	Blueberries	15	W	4.0	9.9
FC 0001	Citrus fruits	3	W	0.21	0.52
JF 0004	Orange juice			0.03	-
FS 0245	Nectarine	10	W	1.6	6.8
FP 0009	Pome fruits	10		3.3	7.3
TN 0085	Tree nuts	0.2	W	0.05	0.09

DIETARY RISK ASSESSMENT

Chronic intake

The evaluation of phosmet has resulted in recommendations for MRLs and STMRs for raw and processed commodities. Consumption data were available for 12 food commodities and were used in the dietary intake calculation. The results are shown in Annex 3.

The International Estimated Daily Intakes for the 5 GEMS/Food regional diets, based on estimated STMRs were in the range 0-40% of the ADI of 0-0.01 mg/kg bw (Annex 3). The Meeting concluded that the long-term intake of residues of phosmet from uses that have been considered by the JMPR is unlikely to present a public health concern.

Short-term intake

The international estimated short-term intake (IESTI) for phosmet was calculated for the food commodities (and their processing fractions) for which maximum residue levels and HRs were estimated and for which consumption data were available. Where group MRLs were estimated (e.g. for citrus fruits) the IESTI was calculated for the specific commodities with data supporting that group MRL (e.g. grapefruit, lemon and orange supporting citrus). The results are shown in Annex 4.

The IESTI varied from 0-1200 % of the acute RfD (0.02 mg/kg bw) for the general population. The IESTI varied from 0-3500% of the acute RfD for children 6 years and below. The estimated short-term intakes that exceeded the acute RfD were apple (1200%), blueberry (120%), nectarine (780%) and pear (900%) for the general population and apple (3500%), blueberry (390%), citrus fruit (grapefruit, 150%, oranges 170%), nectarine (2200%) and pear (3000%) for children 6 years and below. The information provided to the Meeting precluded a conclusion that the acute dietary intake of the above commodities would be below the acute RfD.

The Meeting noted that the existing acute RfD is conservative because it is based on a developmental end-point, which is not appropriate for children. Therefore, the acute RfD for children, and possibly for the general population including women of child bearing age, might be refined if an appropriate single-dose study would be available.

The Meeting concluded that the short-term intake of residues of phosmet from use on tree nuts is unlikely to present a public health concern.
