# DISCLAIMER<sup>1</sup>

FAO specifications are developed with the basic objective of promoting, as far as practicable, the manufacture, distribution and use of pesticides that meet basic quality requirements.

Compliance with the specifications does not constitute an endorsement or warranty of the fitness of a particular pesticide for a particular purpose, including its suitability for the control of any given pest, or its suitability for use in a particular area. Owing to the complexity of the problems involved, the suitability of pesticides for a particular purpose and the content of the labelling instructions must be decided at the national or provincial level.

Furthermore, pesticides which are manufactured to comply with these specifications are not exempted from any safety regulation or other legal or administrative provision applicable to their manufacture, sale, transportation, storage, handling, preparation and/or use.

FAO disclaims any and all liability for any injury, death, loss, damage or other prejudice of any kind that may arise as a result of, or in connection with, the manufacture, sale, transportation, storage, handling, preparation and/or use of pesticides which are found, or are claimed, to have been manufactured to comply with these specifications.

Additionally, FAO wishes to alert users to the fact that improper storage, handling, preparation and/or use of pesticides can result in either a lowering or complete loss of safety and/or efficacy.

FAO is not responsible, and does not accept any liability, for the testing of pesticides for compliance with the specifications, nor for any methods recommended and/or used for testing compliance. As a result, FAO does not in any way warrant or represent that any pesticide claimed to comply with a FAO specification actually does so.

<sup>&</sup>lt;sup>1</sup> This disclaimer applies to all specifications published by FAO.

#### INTRODUCTION

FAO establishes and publishes specifications\* for technical material and related formulations of agricultural pesticides, with the objective that these specifications may be used to provide an international point of reference against which products can be judged either for regulatory purposes or in commercial dealings.

From 1999 onward, the development of FAO specifications follows the **New Procedure**, described first in the 5<sup>th</sup> edition of the "Manual on the development and use of FAO specifications for plant protection products" and later in the 1<sup>st</sup> edition of "Manual for Development and Use of FAO and WHO Specifications for Pesticides" (2002) - currently available as 3<sup>rd</sup> revision of the 1<sup>st</sup> edition (2016) - , which is available only on the internet through the FAO and WHO web sites.

This **New Procedure** follows a formal and transparent evaluation process. It describes the minimum data package, the procedure and evaluation applied by FAO and the Experts of the FAO/WHO Joint Meeting on Pesticide Specifications (JMPS). [Note: prior to 2002, the Experts were of the FAO Panel of Experts on Pesticide Specifications, Registration Requirements, Application Standards and Prior Informed Consent, which now forms part of the JMPM, rather than the JMPS.]

FAO Specifications now only apply to products for which the technical materials have been evaluated. Consequently from the year 1999 onwards the publication of FAO specifications under the **New Procedure** has changed. Every specification consists now of two parts namely the specifications and the evaluation report(s):

- **Part One: The Specification** of the technical material and the related formulations of the pesticide in accordance with chapters 4 to 9 of the "Manual on development and use of FAO and WHO specifications for pesticides".
- **Part Two**: The Evaluation Report(s) of the pesticide, reflecting the evaluation of the data package carried out by FAO and the JMPS. The data are provided by the manufacturer(s) according to the requirements of chapter 3 of the "FAO/WHO Manual on Pesticide Specifications" and supported by other information sources. The Evaluation Report includes the name(s) of the manufacturer(s) whose technical material has been evaluated. Evaluation reports on specifications developed subsequently to the original set of specifications are added in a chronological order to this report.

FAO specifications developed under the **New Procedure** do not necessarily apply to nominally similar products of other manufacturer(s), nor to those where the active ingredient is produced by other routes of manufacture. FAO has the possibility to extend the scope of the specifications to similar products but only when the JMPS has been satisfied that the additional products are equivalent to that which formed the basis of the reference specification.

# Specifications bear the date (month and year) of publication of the current version. Evaluations bear the date (year) of the Meeting at which the recommendations were made by the JMPS.

\* NOTE: PUBLICATIONS ARE AVAILABLE ON THE INTERNET AT (<u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/)</u> OR IN HARDCOPY FROM THE PLANT PROTECTION INFORMATION OFFICER.

#### IMIDACLOPRID

#### INFORMATION

ISO common name imidacloprid (BSI, E-ISO 1750, published)

Synonyms

BAY NTN 33 893

Chemical names

IUPAC(E)-1-(6-chloro-3-pyridylmethyl)-N-nitroimidazolidin-2-ylideneamineCA(2E)-1-[(6-chloro-3-pyridinyl)methyl]-N-nitro-2-imidazolidinimine

Structural formula

 $N - NO_2$ 

Empirical formula C9H10CIN5O2

Relative molecular mass 255.7

CAS Registry number 138261-41-3

CIPAC number 582

Identity tests Retention time in HPLC with UV-detection, IR, NMR

#### IMIDACLOPRID TECHNICAL MATERIAL

FAO Specification 582 / TC (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturers whose names are listed in the evaluation reports (582/2004 582/2012 & 582/2017.1). It should be applicable to TC produced by this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation reports (582/2004, 582/2012 & 582/2017.1) as PART TWO form an integral part of this publication.

#### 1 **Description**

The material shall consist of imidacloprid together with related manufacturing impurities and shall be a beige powder, free from visible extraneous matter and added modifying agents.

#### 2 Active ingredient

#### 2.1 Identity tests (582/TC/M2/2, CIPAC Handbook K, p.70, 2003)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

#### 2.2 Imidacloprid content (582/TC/M2/3, CIPAC Handbook K, p.70, 2003)

The imidacloprid content shall be declared (not less than 970 g/kg) and, when determined, the average measured content shall not be lower than the declared minimum content.

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: <u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/</u>

#### IMIDACLOPRID GRANULES

FAO specification 582 / GR (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation reports (582/2004 & 582/2017.2). It should be applicable to relevant products of these manufacturers but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation reports (582/2004, 582/2012 & 582/2017.2) as PART TWO form an integral part of this publication.

#### 1 **Description**

The material shall consist of granules containing technical imidacloprid, complying with the requirements of FAO Specification 582/TC (May 2018), in the form of rounded beige or colored granules, together with suitable carriers and any other necessary formulants. It shall be dry, free from visible extraneous matter and hard lumps, free-flowing, nearly dust-free and intended for application by machine.

#### 2 Active ingredient

#### 2.1 Identity tests (582/GR/M/2, CIPAC Handbook H, p.190, 1998)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

#### 2.2 Imidacloprid content (582/GR/M/3, CIPAC Handbook H, p.190, 1998)

The imidacloprid content shall be declared (g/kg) and, when determined, the average measured content shall not differ from that declared by more than the following tolerances:

Declared content, g/kg	Tolerance
up to 25	± 25% of the declared content
above 25 up to 100	± 10% of the declared content
Note: the upper limit is included in the range	

#### 3 Relevant impurities

3.1 Water (MT 30.5, CIPAC Handbook J, p.120, 2000)

Maximum: 1 g/kg.

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: <u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/</u>

#### 4 **Physical properties**

- 4.1 **Nominal size range** (MT 170, CIPAC Handbook F, p. 420, 1995) Not less than 950 g/kg of the formulation shall be within the size range 300 to 900 μm.
- 4.2 **Dustiness** (MT 171.1) (Notes 1 & 2) Essentially non dusty.
- 4.3 **Attrition resistance** (MT178.2, CIPAC Handbook K, p. 140, 2003) Minimum: 99% attrition resistance.

#### 5 Storage stability

5.1 Stability at elevated temperature (MT 46.3, CIPAC Handbook J, p.128, 2000)

After storage at  $54 \pm 2^{\circ}$ C for 14 days, the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 3) and the formulation shall continue to comply with the clauses for:

- nominal size range (4.1);
- dustiness (4.2)
- attrition resistance (4.3).
- <u>Note 1</u> Measurement of dustiness must be carried out on the sample "as received" and, where practicable, the sample should be taken from a newly opened container, because changes in the water content of samples may influence dustiness significantly. The optical submethod of MT 171.1, usually shows good correlation with the gravimetric submethod and can, therefore, be used as an alternative where the equipment is available. Where the correlation is in doubt, it must be checked with the formulation to be tested. In case of dispute the gravimetric submethod shall be used.
- <u>Note 2</u> MT 171.1 is the corrected and amended version of MT 171. Prior to its publication in a next Handbook, the method can be downloaded from <u>http://www.cipac.org/index.php/methods-</u> <u>publications/errata</u>
- <u>Note 3</u> Samples of the formulation taken before and after the storage stability test may be analyzed concurrently after the test in order to reduce the analytical error.

#### IMIDACLOPRID WATER DISPERSIBLE POWDER FOR SLURRY SEED TREATMENT

#### FAO Specification 582 / WS (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturers whose names are listed in the evaluation reports (582/2004 & 582/2012). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation reports (582/2004 & 582/2012) as PART TWO form an integral part of this publication.

#### 1 Description

The material shall consist of an homogeneous mixture of technical imidacloprid, complying with the requirements of FAO Specification 582/TC (May 2018), together with carriers and any other necessary formulants, including colouring matter (Note 1). It shall be in the form of a fine powder, free from visible extraneous matter and hard lumps.

#### 2 Active ingredient

- 2.1 **Identity tests** (CIPAC 582/WS/M/2, CIPAC Handbook K, p.75, 2003) The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.
- 2.2 **Imidacloprid content** (CIPAC 582/WS/M/3, CIPAC Handbook K, p.75, 2003) The imidacloprid content shall be declared (g/kg) and, when determined, the content measured shall not differ from that declared by more than the following tolerances.

Declared content, g/kg	Tolerance
above 250 up to 500 above 500	± 5% of the declared content ± 25 g/kg
Note: the upper limit is included in the lower range	

#### 3 Relevant impurities

3.1 Water (MT 30.5, CIPAC Handbook J, p.120, 2000) Maximum: 20 g/kg.

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: <u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/</u>

#### **4 Physical properties**

- 4.1 **Wet sieve test** (MT 185, CIPAC Handbook K, p.148, 2003) (Note 2) Maximum: 0.1% of the formulation shall be retained on a 75 μm test sieve.
- 4.2 Persistent foam (MT 47.3, CIPAC Handbook O, p.177, 2017) (Note 3) Maximum: 20 ml after 1 min.
- 4.3 Wettability (MT 53.3, CIPAC Handbook F, p.165, 1995)

The formulation shall be completely wetted in 1 min without swirling.

4.4 Adhesion to seeds (MT 194, CIPAC Handbook N, p.145, 2012)

Beets: Minimum: 85% of imidacloprid shall remain on the seeds.

#### 5 Storage stability

- 5.1 Stability at elevated temperature (MT 46.3, CIPAC Handbook J, p.128, 2000) After storage at 54 ± 2°C for 14 days the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 4) and the formulation shall continue to comply with the clauses for:
  - wet sieve test (4.1).
  - adhesion to seeds (4.4).
- Note 1 The formulation shall contain a dye or pigment that permanently colours the seed after treatment (red is recommended) and cannot be removed by washing with water. In some countries, there may be a legal requirement that a specific colour shall be used. The same colour must not be used for denaturing seeds to be used as livestock feeding stuffs.
- Note 2 This test should be performed at the application concentration.
- Note 3 The mass of sample to be used in the test should correspond to the highest rate of use recommended by the supplier provided it is within the scope of the method. The test is to be conducted in CIPAC standard water D.
- <u>Note 4</u> Samples of the formulation taken before and after the storage stability test may be analyzed concurrently after the test in order to reduce the analytical error.

#### IMIDACLOPRID WATER DISPERSIBLE GRANULES

FAO specification 582 / WG (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturers whose names are listed in the evaluation reports (582/2004, 582/2012 & 582.2017.2). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation reports (582/2004, 582/2012 & 582/2017.2) as PART TWO form an integral part of this publication.

#### 1 **Description**

The material shall consist of an homogeneous mixture of technical imidacloprid, complying with the requirements of the FAO Specification 582/TC (May 2018), together with carriers and any other necessary formulants. It shall be in the form of spherical granules, with a nominal size range of 0.1 to 0.8 mm and an average of approximately 0.4 to 0.5 mm, for application after disintegration and dispersion in water. The formulation shall be dry, free-flowing, essentially non-dusty, and free from visible extraneous matter and hard lumps.

#### 2 Active ingredient

#### 2.1 Identity tests (CIPAC 582/WG/M/2, CIPAC Handbook K, p.72, 2003)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

#### 2.2 Imidacloprid content (CIPAC 582/WG/M/3, CIPAC Handbook K, p.72, 2003)

The imidacloprid content shall be declared (g/kg) and, when determined, the content measured shall not differ from that declared by more than the following tolerances:

Declared content, g/kg	Tolerance
above 25 up to 100 above 100 up to 250 above 250 up to 500 above 500	<ul> <li>± 10% of the declared content</li> <li>± 6% of the declared content</li> <li>± 5% of the declared content</li> <li>± 25 g/kg</li> </ul>
Note: the upper limit is included in each range	

#### **3** Physical properties

3.1 Wettability (MT 53.3.1, CIPAC Handbook F, p.165, 1995)

The formulation shall be completely wetted in 5 seconds, without swirling.

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: <u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/</u>

- 3.2 Wet sieve test (MT 185, CIPAC Handbook K, p.148, 2003) Maximum: 0.1% retained on a 75 μm test sieve.
- 3.3 **Dispersibility** (MT 174, CIPAC Handbook F, p. 435, 1995) Dispersibility: minimum 80% after 1 minute of stirring.
- 3.4 Suspensibility (MT 184, CIPAC Handbook K, p.142, 2003) (Notes 1 & 2)
   A minimum of 80% shall be in suspension after 30 min in CIPAC standard water D at 30 ± 2°C.
- 3.5 **Persistent foam** (MT 47.3, CIPAC Handbook O, p.177, 2017) (Note 3) Maximum: 20 ml after 1 minute.
- 3.6 **Dustiness** (MT 171.1) (Notes 4 & 5) Essentially non-dusty.
- 3.7 **Flowability** (MT 172.1, CIPAC Handbook O, p.187, 2017)

At least 95 % of the formulation shall pass through a 5 mm test sieve after 20 drops of the sieve.

3.8 Attrition resistance (MT 178.2, CIPAC Handbook K, p. 140, 2003)

Minimum 98 % attrition resistance

#### 4 Storage stability

4.1 Stability at elevated temperature (MT 46.3, CIPAC Handbook J, p.128, 2000)

After storage at  $54 \pm 2^{\circ}$ C for 14 days, the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 6) and the formulation shall continue to comply with the clauses for:

- wet sieve test (3.2)
- dispersibility (3.3)
- suspensibility (3.4)
- dustiness (3.6)
- flowability (3.7)
- attrition resistance (3.8)
- <u>Note 1</u> The formulation should be tested at the highest and lowest rates of use recommended by the supplier.
- <u>Note 2</u> Chemical assay is the only fully reliable method to measure the mass of active ingredient still in suspension. However, the simpler gravimetric method, MT 168, may be used on a routine basis provided that it has been shown to give equal results to those of chemical assay. In case of dispute, chemical assay shall be the "referee method".
- <u>Note 3</u> The mass of sample to be used in the test should be specified at the highest rate recommended by the supplier.
- <u>Note 4</u> Measurement of dustiness must be carried out on the sample "as received" and, where practicable, the sample should be taken from a newly opened container, because changes in the water content of samples may influence dustiness significantly. The optical submethod of MT 171.1, usually shows good correlation with the gravimetric submethod and can, therefore, be used as an alternative where the equipment is available. Where the correlation is in doubt, it must be checked with the formulation to be tested. In case of dispute the gravimetric submethod shall be used.

- <u>Note 5</u> MT 171.1 is the corrected and amended version of MT 171. Prior to its publication in a next Handbook, the method can be downloaded from <u>http://www.cipac.org/index.php/methods-</u> <u>publications/errata</u>
- <u>Note 6</u> Analysis of the formulation, before and after the storage stability test, may be carried out concurrently (i.e. after storage) to reduce analytical error.

#### IMIDACLOPRID SUSPENSION CONCENTRATE

FAO Specification 582 / SC (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturers whose names are listed in the evaluation reports (582/2004, 582/2012 & 582/2017.2). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation reports (582/2004, 582/2012 & 582/2017.2) as PART TWO form an integral part of this publication.

#### 1 Description

The material shall consist of a whitish suspension of fine particles of technical imidacloprid, complying with the requirements of FAO Specification 582/TC (May 2018), in an aqueous phase together with suitable formulants. After gentle agitation the material shall be homogeneous (Note 1) and suitable for further dilution in water.

#### 2 Active ingredient

#### 2.1 Identity tests (582/SC/M2/2, CIPAC Handbook K, p.74, 2003)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

#### 2.2 Imidacloprid content (582/SC/M2/3, CIPAC Handbook K, p.74, 2003)

The imidacloprid content shall be declared (g/kg or g/l at  $20 \pm 2^{\circ}$ C, Note 2) and, when determined, the average measured content shall not differ from that declared by more than the following tolerances:

Declared content, g/kg or g/l at 20 ± 2°C	Tolerance
up to 25 above 25 up to 100 above 100 up to 250 above 250 up to 500	<ul> <li>± 15% of the declared content</li> <li>± 10% of the declared content</li> <li>± 6% of the declared content</li> <li>± 5% of the declared content</li> </ul>
Note: the upper limit is included in each range	

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: <u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/</u>

#### **3 Physical properties**

3.1 Pourability (MT 148.1, CIPAC Handbook F, p.348, 1995)

Maximum "residue": 4%.

3.2 Spontaneity of dispersion (MT 160, CIPAC Handbook F, p.391, 1995) (Note 3)

A minimum of 90% of the imidacloprid content found under 2.2 shall be in suspension after 5 minutes in CIPAC Standard Water D at  $30 \pm 2^{\circ}$ C.

3.3 Suspensibility (MT 184, CIPAC Handbook K, p.142, 2003) (Notes 3 & 4)

A minimum of 95% of the imidacloprid content found under 2.2 shall be in suspension after 30 min in CIPAC Standard Water D at  $30 \pm 2^{\circ}$ C.

3.4 Wet sieve test (MT 185, CIPAC Handbook K, p.148, 2003)

Maximum: 0.1% of the formulation shall be retained on a 75 µm test sieve.

3.5 Persistent foam (MT 47.3, CIPAC Handbook O, p.177, 2017) (Note 4)

Maximum: 40 ml after 1 min.

#### 4 Storage stability

4.1 Stability at 0°C (MT 39.3, CIPAC Handbook J, p.126, 2000)

After storage at  $0 \pm 2^{\circ}$ C for 7 days, the formulation shall continue to comply with the clauses for:

- suspensibility (3.3);

- wet sieve test (3.4).
- 4.2 Stability at elevated temperature (MT 46.3, CIPAC Handbook J, p.128, 2000)

After storage at  $54 \pm 2^{\circ}$ C for 14 days, the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 5) and the formulation shall continue to comply with the clauses for:p

- pourability (3.1);
- spontaneity of dispersion (3.2);
- suspensibility (3.3);
- wet sieve test (3.4).
- Note 1 Before sampling to verify the formulation quality, inspect the commercial container carefully. On standing, suspension concentrates usually develop a concentration gradient from the top to the bottom of the container. This may even result in the appearance of a clear liquid on the top and/or of sediment on the bottom. Therefore, before sampling, homogenize the formulation according to the instructions given by the manufacturer or, in the absence of such instructions, by gentle shaking of the commercial container (for example by inverting the closed container several times). Large containers must be opened and stirred adequately. After this procedure, the container should not contain a sticky layer of non-dispersed matter at the bottom. A suitable and simple method of checking for a non-dispersed sticky layer "cake" is by probing with a glass rod or similar device adapted to the size and shape of the container. All the physical and chemical tests must be carried out on a laboratory sample taken after the recommended homogenization procedure.
- <u>Note 2</u> Unless homogenization is carried out carefully, it is possible for the sample to become aerated. This can lead to errors in the determination of the mass per millilitre and in calculation of the active ingredient content (in g/l) if methods other than MT 3.3 are used. If the buyer requires both g/kg and g/l at 20°C, then in case of dispute the analytical results shall be calculated as g/kg.

- <u>Note 3</u> Chemical assay is the only fully reliable method to measure the mass of active ingredient still in suspension. However, the simpler gravimetric method, MT 168, may be used on a routine basis provided that it has been shown to give equal results to those of chemical assay. In case of dispute, chemical assay shall be the "referee method".
- <u>Note 4</u> The mass of sample to be used in the test should be at the highest rate of use recommended by the supplier.
- <u>Note 5</u> Samples of the formulation taken before and after the storage stability test should be analyzed concurrently after the test in order to reduce the analytical error.

#### IMIDACLOPRID SUSPENSION CONCENTRATE FOR SEED TREATMENT

#### FAO Specification 582 / FS (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturers whose names are listed in the evaluation reports (582/2004 & 582/2012). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation reports (582/2004 & 582/2012) as PART TWO form an integral part of this publication.

#### 1 **Description**

The material shall consist of a suspension of fine particles of technical imidacloprid, complying with the requirements of FAO/WHO Specification 582/TC (May 2018), in an aqueous phase together with suitable formulants, including colouring matter (Note 1). After gentle stirring or shaking, the material shall be homogeneous (Note 2) and is intended for use without dilution.

#### 2 Active ingredient

2.1 Identity tests (582/FS/M/2, CIPAC Handbook K, p.75, 2003)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

2.2 Imidacloprid content (582/FS/M/3, CIPAC Handbook K, p.75, 2003)

The imidacloprid content shall be declared (g/kg or g/l at  $20 \pm 2^{\circ}$ C, Note 3) and, when determined, the average measured content shall not differ from that declared by more than the following tolerances:

Declared content, g/kg or g/l at 20 ± 2°C	Tolerance
above 25 up to 100 above 100 up to 250 above 250 up to 500	<ul> <li>± 10% of the declared content</li> <li>± 6% of the declared content</li> <li>± 5% of the declared content</li> </ul>
Note: the upper limit is included in each range	

#### **3 Physical properties**

3.1 pH range (MT 75.3, CIPAC Handbook J, p.131, 2000)

The pH of the undiluted aqueous suspension shall be 5 to 9.

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/

# 3.2 **Pourability** (MT 148.1, CIPAC Handbook F, p.348, 1995) Maximum "residue": 4%.

3.3 Wet sieve test (MT 185, CIPAC Handbook K, p.148, 2003) (Note 4)

Maximum: 0.1 % retained on a 75 µm test sieve.

3.4 Adhesion to seeds (MT 194, CIPAC Handbook N, p.145, 2012)

Wheat, barley and maize: Minimum: 90% of imidacloprid shall remain on the seeds.

#### 4 Storage stability

4.1 Stability at 0°C (MT 39.3, CIPAC Handbook J, p.126, 2000)

After storage at 0  $\pm$  2°C for 7 days, the formulation shall continue to comply with the clause for:

– wet sieve test (3.3).

4.2 Stability at elevated temperature (MT 46.3, CIPAC Handbook J, p.128, 2000)

After storage at  $54 \pm 2^{\circ}$ C for 14 days, the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 5) and the formulation shall continue to comply with the clauses for:

- pH range (3.1);
- pourability (3.2)
- wet sieve test (3.3).
- adhesion to seeds (3.4).
- Note 1 The formulation shall contain a dye or pigment that permanently colours the seed after treatment (red is recommended) and cannot be removed by washing with water. In some countries, there may be a legal requirement that a specific colour shall be used. The same colour must not be used for denaturing seeds to be used as livestock feeding stuffs.
- <u>Note 2</u> Before sampling to verify the formulation quality, inspect the commercial container carefully. On standing, suspension concentrates usually develop a concentration gradient from the top to the bottom of the container. This may even result in the appearance of a clear liquid on the top and/or sediment on the bottom. Therefore, before sampling, homogenize the formulation according to the instructions given by the manufacturer or, in the absence of such instructions, gently shake the commercial container (for example by inverting the closed container several times, large containers must be opened and stirred adequately). After this procedure, the container should not contain a sticky layer of non-dispersed matter at the bottom. A suitable and simple method of checking for a non-dispersed sticky layer ("cake") is by probing with a glass rod or similar device adapted to the size and shape of the container. All the physical and chemical tests must be carried out on a laboratory sample taken after the recommended homogenization procedure.
- <u>Note 3</u> If the buyer requires both g/kg and g/l at 20°C, then in case of dispute the analytical results shall be calculated as g/kg.

<u>Note 4</u> This test detects coarse particles (e.g. caused by crystal growth) or agglomerates (crust formation) or extraneous materials which could cause blockage of spray nozzles or filters in the spray tank.

<u>Note 5</u> Samples of the formulation taken before and after the storage stability test may be analyzed concurrently after the test in order to reduce the analytical error.

#### **IMIDACLOPRID OIL-BASED SUSPENSION CONCENTRATE**

#### FAO Specification 582 / OD (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (582/2004). It should be applicable to relevant products of these manufacturers but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (582/2004) as PART TWO forms an integral part of this publication.

#### 1 **Description**

The material shall consist of a stable brownish suspension of fine particles of technical imidacloprid, complying with the requirements of FAO Specification 582/TC (May 2018), in an oil phase together with suitable formulants. After shaking or stirring of the sample, the material shall be homogeneous (Note 1) and suitable for dilution in water.

#### 2 Active ingredient

#### 2.1 Identity tests (582/OD/M/2, CIPAC Handbook L p. 89, 2006)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

#### 2.2 Imidacloprid content (582/OD/M/3, CIPAC Handbook L p. 89, 2006)

The imidacloprid content shall be declared (g/kg or g/l at  $20 \pm 2^{\circ}$ C, Note 2) and, when determined, the average measured content shall not differ from that declared by more than the following tolerances:

Declared content, g/kg or g/l at 20 ± 2°C	Tolerance
above 100 up to 250	± 6% of the declared content
above 250 up to 500	± 5% of the declared content
Note: the upper limit is included in each range	

#### **3** Physical properties

#### 3.1 **Pourability** (MT 148.1, CIPAC Handbook J, p. 133, 2000)

Maximum "residue": 5%.

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: <u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/</u>

# 3.2 Dispersion stability (MT 180, CIPAC Handbook O, p. 192, 2017)

The formulation, when diluted at  $30 \pm 2^{\circ}$ C (Note 3) with CIPAC Standard waters A and D, shall comply with the following:

Time after allowing the dispersion to stand	Limits of stability
0 h	Initial dispersion complete
0.5 h	"Cream", maximum: 0.5 ml "Free oil", maximum: trace "Sediment", maximum: 0.1 ml
24 h	Re-dispersion complete
24.5 h	"Cream", maximum: 1 ml "Free oil", maximum: trace "Sediment", maximum: 0.25 ml

- 3.3 Wet sieve test (MT 185, CIPAC Handbook K, p.148, 2003) (Note 4)
   Maximum: 0.2% of the formulation shall be retained on a 75 μm test sieve.
- 3.4 **Persistent foam** (MT 47.3, CIPAC Handbook O, p.192, 2017) (Note 5) Maximum: 50 ml after 1 min.

#### 4 Storage stability

4.1 Stability at 0°C (MT 39.3, CIPAC Handbook J, p.126, 2000)

After storage at 0  $\pm$  2°C for 7 days, the formulation shall continue to comply with the clauses for:

- dispersion stability (3.2);
- wet sieve test (3.3);

#### 4.2 Stability at elevated temperature (MT 46.3, CIPAC Handbook J, p.128, 2000)

After storage at  $54 \pm 2^{\circ}$ C for 14 days, the determined average active ingredient content must not be lower that 95% relative to the determined average content found before storage (Note 6) and the formulation shall continue to comply with the clauses for:

- pourability (3.1);
- dispersion stability (3.2);
- wet sieve test (3.3).
- Note 1 Before sampling to verify the formulation quality, inspect the commercial container carefully. On standing, suspension concentrates usually develop a concentration gradient from the top to the bottom of the container. This may even result in the appearance of a clear liquid on the top and/or sediment on the bottom. Therefore, before sampling, homogenize the formulation according to the instructions given by the manufacturer or, in the absence of such instructions, gently shake the commercial container (for example by inverting the closed container several times, large containers must be opened and stirred adequately). After this procedure, the container should not contain a sticky layer of non-dispersed matter at the bottom. A suitable and simple method of checking for a non-dispersed sticky layer ("cake") is by probing with a glass rod or similar device adapted to the size and shape of the container. All the physical and chemical tests must be carried out on a laboratory sample taken after the recommended homogenization procedure.
- <u>Note 2</u> If the buyer requires both g/kg and g/l at 20°C, then in case of dispute the analytical results shall be calculated as g/kg.
- <u>Note 3</u> The formulation should be tested at 2% dilution or, alternatively, at the highest and lowest rates of use recommended by the supplier.
- <u>Note 4</u> This test detects coarse particles (e.g. caused by crystal growth) or agglomerates (crust formation) or extraneous materials which could cause blockage of spray nozzles or filters in the spray tank.
- <u>Note 5</u> The mass of sample to be used in the test should be at the highest rate of use recommended by the supplier.
- <u>Note 6</u> Samples of the formulation taken before and after the storage stability test may be analyzed concurrently after the test in order to reduce the analytical error.

#### IMIDACLOPRID WATER SOLUBLE CONCENTRATE

FAO Specification 582 / SL (May 2018<sup>\*</sup>)

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturers whose names are listed in the evaluation reports (582/2004, 582/2012 & 582/2017.2). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation reports (582/2004, 582/2012 & 582/2017.2) as PART TWO form an integral part of this publication.

#### 1 Description

The material shall consist of technical imidacloprid, complying with the requirements of FAO Specification 582/TC (May 2018), dissolved in suitable solvents, together with any other necessary formulants. It shall be in the form of a clear or opalescent liquid, free from visible suspended matter and sediment, to be applied as a true solution of the active ingredient in water.

#### 2 Active ingredient

2.1 Identity tests (CIPAC 582/SL/M/2, CIPAC Handbook L, p.89, 2006)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

2.2 Imidacloprid content (CIPAC 582/SL/M/3, CIPAC Handbook L, p.89, 2006)

The imidacloprid content shall be declared (g/kg or g/l at  $20 \pm 2^{\circ}$ C, Note 1) and, when determined, the average measured content shall not differ from that declared by more than the following tolerances:

Declared content, g/kg or g/l at 20 ± 2°C	Tolerance
above 25 up to 100	± 10% of the declared con-
above 100 up to 250	tent
	± 6% of the declared content
Note: the upper limit is included in each	
range	

#### **3 Physical properties**

3.1 Solution stability (MT 41.1, CIPAC Handbook O, p.174, 2017)

The formulation following dilution (Note 2) with CIPAC standard water D and standing at  $30 \pm 2^{\circ}$ C for 24 h, shall give a clear or opalescent solution, free from more than a trace of sediment and visible solid particles. Any visible sediment or particles produced shall pass through a 75 µm test sieve.

<sup>\*</sup> Specifications may be revised and/or additional evaluations may be undertaken. Ensure the use of current versions by checking at: <u>http://www.fao.org/agriculture/crops/core-themes/theme/pests/jmps/ps-new/en/</u>

#### 3.2 Persistent foam (MT 47.3, CIPAC Handbook O, p.177, 2017) (Note 3)

Maximum: 50 ml after 1 minute.

#### **4 Storage stability**

4.1 Stability at 0°C (MT 39.3, CIPAC Handbook J, p.126, 2000)

After storage at  $0 \pm 2^{\circ}$ C for 7 days, the volume of solid and/or liquid which separates shall not be more than 0.1 ml.

4.2 Stability at elevated temperature (MT 46.3, CIPAC Handbook J, p.128, 2000)

After storage at  $54 \pm 2^{\circ}$ C for 14 days, the determined average active ingredient content must not be lower than 95 % relative to the determined average content found before storage (Note 4) and the formulation shall continue to comply with the clause for:

- solution stability (3.1)
- <u>Note 1</u> If the buyer requires both g/kg and g/l at 20°C, then in case of dispute the analytical results shall be calculated as g/kg.
- <u>Note 2</u> The concentration used for the test should not be higher than the highest concentration recommended in the instructions for use.
- <u>Note 3</u> The mass of sample to be used in the test should correspond to the highest rate of use recommended by the supplier. The test is to be conducted in CIPAC standard water D.
- <u>Note 4</u> Samples of the formulation taken before and after the storage stability test may be analyzed concurrently after the test in order to reduce the analytical error.

# IMIDACLOPRID

# FAO/WHO EVALUATION REPORT 582/2017.2

#### Recommendations

The Meeting recommended that the revised and amended FAO Specifications for imidacloprid should be adopted as follows:

(i) SL specification: revision of the clauses for persistent foam and storage stability

(ii) GR specification: deletion of the pour and tap density clause

(iii) WG specification: amending the clause for suspensibility

(iv) all formulation specifications: editorially updated to reflect the latest edition of the Pesticide Manual (3<sup>rd</sup> revision of the 1<sup>st</sup> edition, 2016)

# Appraisal

The data for imidacloprid were evaluated in support of new FAO specifications based on the draft specifications and the supporting data provided by Bayer CropScience AG in 2003, by Cheminova A/S for extension of GR specification in 2007 and by Cheminova A/S for extension of TC, WG, SL, SC, WS and FS formulations in 2012. The FAO full specifications for imidacloprid were published in 2006, 2008 and 2013. [FAO, 2013]

Supporting data on imidacloprid SL, WG and GR formulations were provided by Bayer Crop-Science AG (Bayer) in December 2016 in support of a revision of the existing specifications 582/SL (May 2013), 582/WG (May 2013) and 582/GR (May 2013).

A proposal was made to change the limit in the clause for persistent foaming of the imidacloprid SL formulation. During the development of a new formulation with a more favorable classification, a coformulant was exchanged. However, the new formulation showed a persistent foam exceeding the existing limit of 5 ml. The newly proposed value of 50 ml is acceptable, being below the normally accepted default limit of 60 ml of foam. Bayer also proposed to modify the imidacloprid content after storage from 97 to 95%, proposal that can be accepted based on the general requirements of the Manual.

A proposal was also made to delete the pour and tap density clause from the GR formulation, mainly due to the fact that there exists a broad range of imidacloprid containing granules requiring a correspondingly broad and non-discriminative range of pour and tap densities. The Meeting agreed to remove the clause from the GR specification.

The company proposed to lower the limit for the suspensibility from 95% to 80% for the WG formulations, explaining that, due to the transfer of production of WGs in several factories, these factories do not have the same technology, resulting in different values in suspensibility at the end of the different processes. This limit of 80% is still representing good quality, still significantly higher than the minimum limit of 60% and allowed to transfer the production on different factories, on different continents. The justification was accepted by the Meeting.

The Meeting proposed to update the clause for dustiness in the case of the WG and GR formulations to draw them in line with the current version of the Manual proposing to use MT

171.1 and to express the results in maximum collected dust. It was also proposed to update the clauses for solution stability and persistent foam, making reference to the methods required by the actual version of the Manual, i.e. MT 41.1 and MT 47.3.

Bayer finally proposed to modify the minimum imidacloprid content after storage from 97 to 95% for all formulation types not yet revised (i.e.: WG, SC) for harmonization reasons. This proposal has no impact on the quality of these formulation types and can be accepted based upon the general requirements as reported in the Manual.

The Meeting agreed to revise the imidaclorprid SL, WG and GR formulations according to the proposals of Bayer CropScience and the editorial changes needed to align them with the requirements of the third revision of the first edition of the Manual on the development and use of FAO and WHO specifications for pesticides.

# IMIDACLOPRID

# FAO/WHO EVALUATION REPORT 582/2017.1

#### Recommendations

The Meeting recommended:

- (i) that the imidacloprid TC, proposed by UPL Limited, be accepted as equivalent to the imidacloprid reference profile
- (ii) to extend the existing FAO specification for imidacloprid TC to the technical material produced by UPL Limited.
- (iii) the specification for imidacloprid TC, including the extension to the technical material produced by UPL Limited, should be adopted by WHO.
- (iv) the specification for imidacloprid UL (in combination with prallethrin), proposed by Clarke Mosquito Control Products, Inc., and as amended, should be adopted by WHO, subject to the adoption of the extensions of the analytical methods for imidacloprid and prallethrin to UL formulations by CIPAC.

#### Appraisal

The data for imidacloprid were evaluated in support of new FAO specifications based on the draft specifications and the supporting data provided by Bayer CropScience AG in 2003, by Cheminova A/S for extension of GR specification in 2007 and by Cheminova A/S for extension of TC, WG, SL, SC, WS and FS formulations in 2012. The FAO specifications for imidacloprid were published in 2006, 2008 and 2013. [FAO, 2013]

Supporting data on imidacloprid TC were provided by UPL Limited (UPL) in support of an equivalence determination with the reference profile that supports the existing imidacloprid FAO specifications 582/TC (May 2013) and to extend it also as WHO specification.

The data submitted were in accordance with the requirements of the FAO/WHO Manual, [FAO/WHO 2016] and supported the existing specifications.

UPL's imidacloprid is currently registered in Argentina, Australia, China, Costa Rica, Mexico, South Korea and United States of America.

The confidential data provided on the manufacturing process of imidacloprid are the same as those submitted for registration in the United States of America. The 5-batch analysis results submitted to FAO are the same as those provided to the US-EPA for registration purposes. The impurities and QC limits for imidacloprid TC produced by UPL agree exactly between the information submitted to FAO and to the US [EPA].

The Meeting was provided with commercially confidential information on the manufacturing process and batch analysis data. Mass balances were 99.8 - 99.9 % in the 5-batch data. The declared minimum active ingredient content in the TC (975 g/kg) is slightly higher than that of the existing FAO specification (970 g/kg).

Manufacturing limits for impurities identified in the technical material did not exceed the limits in the reference profile with more than the acceptable values, except for one impurity considered of no significance.

The analytical method for the imidacloprid content was reversed-phase HPLC with UV detection, based on the CIPAC method 582/TC/(M2/3. [CIPAC K] Impurities were also determined by HPLC-UV. Validation data were provided for imidacloprid and the impurities. Methods for the impurities were validated with LOQs of 0.2 - 2.07 g/kg in the TC.

The manufacturing pathway of this technical material is different from that of the product with the reference profile, however the impurity profiles are similar. Tier-1 information was sufficient to decide on the equivalence of UPL's imidacloprid TC with the reference profile of Bayer.

In addition to the *in-vitro* mutagenicity required in Tier-1 of the equivalence determination, additional studies on toxicology were available for rat acute oral, rat acute dermal, rat acute inhalation, rabbit eye irritation, rabbit skin irritation and Guinea pig skin sensitization and also for a rat pre-natal developmental toxicity. These studies were not taken into consideration during the evaluation of the equivalence of the technical materials.

The Meeting concluded that the UPL imidacloprid TC was equivalent to the imidacloprid reference TC based on Tier-1 evaluation.

The Meeting noted that imidacloprid currently has a TC specification for FAO, but does not have a WHO specification. Since a second manufacturer wanted to extend the FAO equivalence but also requested an extension WHO specification, the Meeting recommended that the holder of the reference TC specification (Bayer) should be contacted and asked for agreement with the extension of the TC specification to WHO. This was done in the meantime and a written agreement by Bayer was received, stating that there would be no objection from their side to extend the imidacloprid FAO TC specification to WHO as well.

#### METHODS OF ANALYSIS AND TESTING

The analytical method for the active ingredient (including identity tests) is a HPLC method using a reversed phase column based on CIPAC method 582/TC/M2/3 [JRF-5551] The methods for determination of impurities are based on analysis by reverse phase liquid chromatography using a C<sub>8</sub> column, UV detection and quantification by external standard, and additional methods by ion chromatography and titration. [JRF-5551]

Test methods for determination of physico-chemical properties of the technical active ingredient were OECD and CIPAC.

#### FORMULATIONS AND CO-FORMULATED ACTIVE INGREDIENTS

The main formulation types available are GR, WG, WS, SC, SL, OD and FS (agricultural formulations).

Up to now, imidacloprid does not have any approved public health uses with the exception of some approvals for use against bed bugs.

Imidacloprid may be co-formulated with other insecticides or fungicides.

UPL's imidacloprid formulations are registered and sold in a range of countries including Argentina, Australia, China, Costa Rica, Mexico, South Korea, United States of America.

#### PHYSICAL PROPERTIES

The physical properties, the methods for testing them and the limits proposed for the TC were OECD, CIPAC as appropriate.

#### CONTAINERS AND PACKAGING

No special requirements for containers and packaging have been identified.

#### EXPRESSION OF THE ACTIVE INGREDIENT

The content of active ingredient is expressed as imidacloprid.

#### ANNEX 1

#### HAZARD SUMMARY PROVIDED BY THE PROPOSER

Notes.

•

(i) The proposer confirmed that the toxicological data included in the summary below were derived from imidacloprid having impurity profiles similar to those referred to in the table above.

(ii) The conclusions expressed in the summary below are those of the proposer, unless otherwise specified.

# Table 2. Mutagenicity profile of imidacloprid technical material based on *in vitro* tests

Species	Test	Purity % Note <sup>2</sup>	Guideline, duration, doses and conditions	Result	Study num- ber
Salmonella typhimurium	<i>In vitro</i> test. Reverse muta- tion in five strains of <i>Salmo- nella typhimurium</i> (TA1537, TA1535, TA98, TA100 and TA102)	98.02	OECD 471, between156.25 to 5000 µg/plate both in absence and presence of metabolic activation system for 5 strains	Negative [Non-Mutagenic] Bacterial cultures were exposed to imidaclo- prid technical at eight concentrations (two plates/concentration) between 1.5 and 5000 µg/plate both in the absence and presence of metabolic activation system (5% v/v S9 mix) in the initial toxicity-mutation test. Imidacloprid technical did not induce any sig- nificant increase in the number of revertants, with and without S9 mix, in any of the five tester strains. To confirm the negative results obtained in the initial toxicity mutation test, confirmatory mutation test was conducted with the concentration modification and in- creased S9 concentration i.e. 10 % v/v	481-1-06- 14432

<sup>&</sup>lt;sup>2</sup> Note: Purity is the content of pure active ingredient in the technical material, expressed as a percentage.

#### Background information on toxicity and ecotoxicity

Imidacloprid was evaluated by the FAO/WHO JMPR in 2001 for toxicology and in 2002, 2006 and 2008 for residues.

The IPCS hazard classification of imidacloprid is: moderately hazardous, class II. [IPCS 2009]

Classification according to Reg. 1272/2008 as amended: [Reg 1272]

Xn;R22: Harmful if swallowed.

N; R50/53: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

GHS classification according to UN edition 2005: [WHO, 2005]

Acute oral toxicity: Category 4 (H302)

Hazards to the aquatic environment: Acute and Chronic Category 1 (H400, H410)

## IMIDACLOPRID

## FAO/WHO EVALUATION REPORT 582/2012

#### Recommendations

The Meeting recommended that:

(i) the specification for imidacloprid TC proposed by Cheminova A/S be accepted as equivalent to the imidacloprid reference profile

(ii) the existing TC specification be extended to the technical material produced by Cheminova A/S.

(iii) the existing WG, SL, SC, WS and FS specifications be extended to the materials produced by Cheminova A/S, with certain revisions, e.g. updated references to CIPAC methods

(iv) the IUPAC name imidacloprid be amended in the existing specification to bring it in line with the latest published version

(v) the inclusion of the adhesion to seeds specification clause for the existing imidacloprid WS and FS specifications,

(vi) the storage stability specification clause in the WG, SL and WS specifications be amended to bring it in line with the latest revision of the Specification manual

### Appraisal

Imidacloprid is not under patent.

Imidacloprid was evaluated by the FAO/WHO JMPR in 2001 for toxicology and in 2002, 2006 and 2008 for residues. [JMPR 2001, JMPR 2002, JMPR 2006, JMPR 2008] It was evaluated by U.S. EPA, the results were published in the U.S Federal Register.[EPA 1994, EPA 1996, EPA 2010]. Imidacloprid was evaluated by the European Commission as part of the EU review of existing active substances for inclusion in Annex I of the Council directive 91/414/EEC in 2009. It was included in Annex I with a minimum purity of 970 g/kg. [CR, 2011]

The data for imidacloprid were evaluated in support of new FAO specifications based on the draft specifications and the supporting data provided by Bayer CropScience in 2003 and Cheminova A/S for extension of GR specification in 2007. The FAO specifications for imidacloprid were published in 2006 and 2008. [FAO, 2006]

Supporting data on imidacloprid TC, WG, SL, SC, WS and FS formulations were provided by Cheminova A/S in support of an equivalence determination with the reference profile that supports the existing imidacloprid FAO specifications 582/TC (April 2006), 582/WG (April 2006), 582/SL (April 2006), 582/SC (April 2006), 582/WS (April 2006) and 582/FS (April 2006).

The data submitted were in accordance with the requirements of the [FAO/WHO Manual, 2010] and supported the existing specifications.

Cheminova A/S imidacloprid is currently registered in Australia, Argentina, Brasil, EU, as well as several other countries.

The confidential data provided on the manufacturing processes of imidacloprid are identical to those submitted for registration in the United Kingdom. The 5-batch analysis results submitted to FAO are the same as those provided to the UK for registration purposes. The impurities and QC limits for imidacloprid TC produced by Cheminova A/S agree exactly between the information submitted to FAO and to the UK. [Tessier, 2011]

The Meeting was provided with commercially confidential information on the manufacturing processes and batch analysis data. None of the impurities present in batches were above 1 g/kg and as a consequence they were not included in the specification of the TC. Mass balances were 99.8 – 100.9 % in the 5-batch data. The declared minimum active ingredient content (970 g/kg) agrees with that of the FAO specification, however based on the Cheminova's data even a higher value could have been proposed.

Manufacturing limits for impurities identified in the technical material did not exceed the limits in the reference profile. Three new impurities were identified. Two of the new impurities in the Cheminova A/S imidacloprid technical are probably formed in the last reaction step before recristallyzation. These impurities were considered not relevant based on the mutagenicity test conducted using a technical material included also in the 5-batch analysis of imidacloprid with a content of these impurities similar to that of the 5-batches.

The findings in the study allowed the conclusion that the test material did not induce mutation under the conditions of the study. [549 IDC] A further Ames test on technical material containing 0.16% w/w of one of these impurities was conducted and was also negative. [377 IDC]. Due to the structural similarity of these two impurities, both of them were considered not relevant.

The third impurity has a toxicity that is completely different in humans from that of the a.i. and therefore should qualify as relevant. But as it has not been detected using a method with an LOQ of 0.61 g/kg, this would mean that at an oral  $LD_{50}$  dose (450 mg/kg in the WHO classification for pesticides) of imidacloprid, the dose of this impurity would be <0.27 mg/kg, and this is below the US EPA oral reference dose to humans and thus the margin of safety

should be sufficiently large. In conclusion, this third impurity is not considered relevant in the imidacloprid technical material.

The company used CIPAC method 582/TC/M2/3 [CIPAC K] for determination of the content of the active ingredient imidacloprid in TC and formulations. The impurities in the TC were determined by HPLC-UV as well. Validation data were provided for imidacloprid and the impurities. Methods for the impurities were validated to LOQs of 0.46 - 0.72 g/kg in the TC. As the synthetic pathways of this technical material are completely different from that of the product with the reference profile, and also the impurity profiles are completely different, the equivalence cannot be decided based on Tier-1 evidence only. As a consequence, in addition to the mutagenicity required in the first tier, additional studies on toxicology are needed for equivalence determination. Toxicity data were available for reverse mutation in Salmonella typhimurium and Escherichia coli, for rat acute oral, rat acute dermal, rat acute inhalation, rabbit eye irritation, rabbit skin irritation and mice skin sensitization. The ratings were equivalent to those of the reference material, except the rabbit eye irritation study, where imidacloprid technical was classified as minimally irritating to the eye under the classification scheme used in the study. According to the Globally Harmonised System of Classification and Labelling of Chemicals (GHS) however, this study would not trigger for eye irritation. WHO, 2009; CLP, 2009]

The Meeting concluded that the Cheminova A/S imidacloprid TC was equivalent to the imidacloprid reference TC based on Tier-1 and Tier-2 evaluation.

The ISO common name 'imidacloprid' was originally approved for a mixture of (E)- and (Z)isomers, but in 2007 it was determined that the substance in crystalline form is comprised almost entirely of the (E)-isomer and requested that the definition be changed. The original proposer (Bayer AgroScience) approached ISO and they agreed to change what the ISO name referred to. Cheminova confirmed that their technical material also entirely consists of the (*E*)-isomer. The method Cheminova use for analysis of imidacloprid in imidacloprid technical is based on the existing CIPAC method (CIPAC MT 582/TC/M2/).

Physical property data were provided for imidacloprid SL, SC, WG, FS and WS formulations for comparison with the existing specifications. The formulations complied with all specifications before and after storage.

The Manual on development and use of FAO and WHO specifications for pesticides. (November 2010 - second revision of the First Edition) proposes the inclusion of the adhesion to seeds specification clause for the WS and FS specifications. As Cheminova's application was for equivalence, and no clause was previously included in the existing FAO specifications for imidacloprid FS and WS, a clause for attrition resistance has not been proposed by Cheminova on purpose.

However the company confirmed that the inclusion of such a clause for the WS and FS specifications with a proposed limit of minimum 98% would be acceptable.

The Meeting recommended amendment of the IUPAC name of imidacloprid in the existing FAO specifications to (E)-1-(6-chloro-3-pyridylmethyl)-N-nitroimidazolidin-2-ylideneamine.

The Meeting recommended amendment of the existing WS and FS specifications including the clause for adhesion to seeds (MT 194).

The Meeting also recommended amendment of the storage stability test specification clause:

-for imidacloprid WG by adding attrition resistance to be tested also after storage

-for imidacloprid SL by adding solution stability to be tested also after storage

-for imidacloprid WS and FS by adding adhesion to seeds to be tested also after storage as recommended by the revised (second revision November 2010) 1<sup>st</sup> edition of the Manual on development and use of FAO and WHO specifications for pesticides.

## SUPPORTING INFORMATION FOR

**EVALUATION REPORT 582/2012** 

#### USES

Imidacloprid is an insecticide belonging to the nitroguanidine subgroup of the neonicotinoids. These compounds act on the nicotinic acetylcholin receptor (nAChR) and interfere with the transmission of nerve impulses in insects. It has a broad spectrum of contact and ingestion activity against insect pests, and lacks activity against spider mites or nematodes. It is systemic in plants and has significant residual activity. It is used in agriculture against sucking insects, phytophagous coleoptera and various other pests.

#### Identity of the active ingredient

ISO common name

imidacloprid (E-ISO 1750, published)

Synonyms

#### FORMULATIONS

The main formulation types available are GR, WG SL, SC, WS and FS (agricultural formulations).

Imidacloprid can be co-formulated with gamma-cyhalothrin and tebuconazole.

Cheminova's imidacloprid GR, WS, WG, SC, FS and SL formulations are registered and sold in a range of countries throughout the world, including Member States of the EU, Australia, USA, Brazil and Argentina.

#### METHODS OF ANALYSIS AND TESTING

The analytical method for the active ingredient (including identity tests) is an HPLC method using a reversed phase column based on CIPAC method 582/SC/M2/. [VAM 132-01] The methods for determination of impurities are based on analysis by reverse phase liquid chromatography using RP18 column, UV detection and quantification by external standard, and an additional method by gas chromatography using a capillary column and detection by FID. Quantification is performed using external calibration.

Test methods for determination of physico-chemical properties of the technical active ingredient were OECD, while those for the formulations were CIPAC, as indicated in the specifications. [CIPAC Handbooks F, H, J, K and L, respectively]

#### CONTAINERS AND PACKAGING

No special requirements for containers and packaging have been identified.

#### EXPRESSION OF THE ACTIVE INGREDIENT

The active ingredient is expressed as imidacloprid.

#### HAZARD SUMMARY

The IPCS hazard classification of imidacloprid is: moderately hazardous, class II. [IPCS 2009]

Classification according to Reg. 1272/2008 as amended: [Reg 1272]

Xn;R22: Harmful if swallowed.

N; R50/53: Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.

GHS classification according to UN edition 2005: [WHO, 2005]

Acute oral toxicity: Category 4

Hazards to the aquatic environment: Acute and Chronic Category 1

#### ANNEX 1

#### HAZARD SUMMARY PROVIDED BY THE PROPOSER

Notes.

.

(i) The proposer confirmed that the toxicological and ecotoxicological data included in the summary below were derived from imidacloprid having impurity profiles similar to those referred to in the table above.

(ii) The conclusions expressed in the summary below are those of the proposer, unless otherwise specified.

Species	Test	Purity % Note <sup>3</sup>	Guideline, duration, doses and conditions	Result	Study num- ber
Salmonella typhimurium Escherichia coli	<i>In vitro</i> test. Reverse mutation in four strains of <i>Salmonella typhi-</i> <i>murium</i> (TA 98, TA 100, TA 1535 and TA 1537) and one strain of <i>Escherichia</i> <i>coli</i> (WP2 uvrA).	99.0	Guideline: OECD 471, EEC B13/14 and EPA OPPTS 870.5100 Imidacloprid technical was tested in two independent experiments in the following concentrations: 31.6, 100, 316, 1000, 2500 and 5000 µg/plate in the absence and presence of S-9 in the four strains of <i>Salmonella typhimurium</i> and the one strain of <i>Escherichia coli</i> . The plates were incubated at 37 °C for 48 hrs.	The sensitivity of the assay was validated. No biological relevant increases in revertant colony numbers of any of the five tested strains were observed following treatment with imidacloprid technical at any concen- tration level, neither in the presence nor ab- sence of metabolic activation. Imidacloprid technical did not cause gene mutations by base pair changes or frameshifts in the genome of the strains used.Imidacloprid TC is considered to be non-mutagenic under the condition of this bacterial reverse mutation assay.	549 IDC

#### IMIDACLOPRID

#### FAO/WHO EVALUATION REPORT 582/2004

#### Recommendations

The Meeting recommended the following.

- (i) The specifications for imidacloprid TC, GR, WG, WS, SC, FS, OD and SL, proposed by Bayer CropScience AG, as amended, should be adopted by FAO.
- (ii) The manufacturer should resubmit a draft specification for imidacloprid DT when validated test methods and agreed guidelines become available for tablet integrity.

#### Appraisal

The Meeting considered data on imidacloprid, submitted by Bayer AG/Bayer Crop-Science AG, for the development of new FAO specifications for TC, GR, WS, WG, SC, FS, OD and SL. A draft specification for DT was also submitted but, in the absence of suitable test methods and agreed characteristics for tablet integrity, this was not considered further. The data and proposed specifications were broadly in accordance with the requirements of the FAO/WHO manual. Imidacloprid is under patent till 2006.

Imidacloprid is an off-white powdered solid, of very low volatility. It has slight solubility in water, which is not influenced by pH, but is not fat-soluble. It is not measurably acidic or basic; it is stable at pH 4 and 7 and only very slowly hydrolyzed at pH 9. In contrast, it is subject to very rapid photolysis, which forms a major route of dissipation in the environment.

Confidential information on the method of manufacture, the technical specification and data from the analysis of production batches was presented to the meeting. Mass balances in the batch analyses were high (99.6-99.7%). The data presented were confirmed as identical to those submitted for registration in Europe (Germany is rapporteur member state for the re-evaluation and authorization of imidacloprid in the European Union under the provisions of directive 91/414/EEC).

The Meeting agreed that none of the impurities should be considered as relevant. Analytical methods for imidacloprid (including identity tests) in TC, GR, WG, WS, SC, FS, OD, SL are full CIPAC methods. The method for GR was published in CIPAC Handbook H. The methods for TC, WG, WS, SC, FS were published in CIPAC handbook K and extensions to OD and SL were adopted by CIPAC 2004 but are not yet published. In these methods, imidacloprid is determined by reversedphase HPLC, using external standardization and detection at 260 nm.

The method for determination of impurities was also based on reversed-phase HPLC, using isocratic elution, UV-detection and external standardization with authentic standards.

Test methods for determination of physico-chemical properties of the technical active substance were OECD, USEPA, EC, while those for the formulations were for example, CIPAC, as indicated in the specifications.

The physical properties, the methods for testing them and the limits proposed for the GR, WS, WG, SL, SC and OD specification, as amended following discussions between the Meeting and manufacturer, comply with the requirements of the FAO/WHO Manual.

The proposed specification for FS did not incorporate a clause for suspensibility, because the manufacturer explained that the product is not intended for dilution with water before use. The Meeting agreed that the clause was inappropriate in this case, that the description clause should be amended to reflect this, and that the test for persistent foam should be conducted on the undiluted product. The manufacturer noted that the red dye in the undiluted FS tends to make the exact determination of persistent foam more difficult than is usual with method MT 47.2 but stated that the product does comply with the specification.

## SUPPORTING INFORMATION FOR EVALUATION REPORT 582/2004

#### Uses

Imidacloprid is a chloronicotinyl (also known as neonicotinoid) insecticide with a broad spectrum of contact and ingestion activity against insects but with no activity against spider mites or nematodes. It is used against sucking insects (such as aphids, whiteflies, leaf-hoppers, thrips, scales, mealy bugs, psyllids, phylloxera), phytophagous coleoptera (such as Colorado beetles, rice water weevils, wireworms, beetle grubs, flea beetles), and various other pests (such as lepidopterous leaf-miners, some dipterous pests, termites, locusts and fleas). It is systemic in plants, has significant residual activity, and controls pests which are resistant to other classes of insecticide.

Imidacloprid interferes with the transmission of nerve impulses in insects. As with the naturally occurring signal-transmitter acetylcholine, imidacloprid stimulates nerve cells by acting on a receptor protein. In contrast to acetylcholine, which is quickly degraded by the enzyme acetylcholine-esterase, imidacloprid is inactivated either very slowly or not at all. Pest feeding activity ceases within minutes to hours and death occurs usually within 24-48 hours but can take up to a few days.

Identity of the active ingredient

ISO common names

Imidacloprid (BSI, E-ISO), imidaclopride ((m) draft F-ISO)

Synonyms

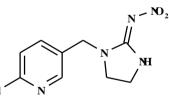

BAY NTN 33 893

Chemical names

*IUPAC* 1-(6-chloro-3-pyridinylmethyl)-*N*-nitroimidazolidin-2-ylideneamine

CA 1-[(6-chloro-3-pyridinyl)methyl]-N-nitro-2-imidazolidinimine

Structural formula

*Empirical formula* C9H10CIN5O2

Relative molecular mass 255.7

CAS Registry number 138261-41-3

CIPAC number

582

Identity tests

HPLC retention time, IR and <sup>1</sup>H-NMR spectra.

## Physical and chemical properties

Characteristic	Value	Purity,	Method	Reference
		%		
Vapour pres- sure	4 x 10 <sup>-10</sup> Pa at 20°C 9 x 10 <sup>-10</sup> Pa at 25°C	99.9	OECD 104, by extrapolation	PC313
Melting point	144°C	99.9	OECD 102	PC312
Boiling point	Not measurable	-	-	PC14376
Decomposition temperature	DTA-measurement: No exothermic decomposition occurred b 150 °C.	99.5	OECD 113	PC339
	TGA-measurement: Above 230 °C, a weight loss was ob- served both under air and under a nitro- gen atmosphere.			
	Imidacloprid is thermally stable at room temperature.			
Solubility in water	0.61 g/l at 20°C Solubility is not influenced by pH in the range pH 4 to 9.	97.2	EEC A6 OECD 105	PC320
Octanol:water partition coeffi- cient	$P_{OW} = 3.7$ Log $P_{OW} = 0.57$ at 21°C Effect of pH not investigated because pH (4- 9) does not influence water solubility.	99.8	EEC A8 OECD 107	PC337
Hydrolysis	Imidacloprid was found to be stable with a half-life > 1 year at pH 5 and 7. Slow hydrolysis with a half-life of approx. 1 year occurred at pH 9.	>99.8	EPA 161-1	NR1276
Photolysis	Half-life = 57 min. at 5.4 mg/l, 23 to 24.5°C, sterile conditions, irradiated with xenon lamp and UV-glass filter (cut-off 290 nm). The corresponding rate constant was 0.012 min <sup>-1</sup> . Environmental half-life in surface water calculated as 4.2 h, at 50° latitude (e.g. N. Germany) and at the equinox.	>99.8	EPA 161-2	PF3517
Dissociation characteristics	Imidacloprid shows very weakly basic prop- erties. Complete protonation can be achieved only in non-aqueous solutions in presence of very strong acids. It is not pos- sible to determine a pK value in pure aque- ous systems.	99.8	OECD 112	PC317

#### Table 1. Physicochemical properties of pure imidacloprid

## Table 2. Chemical composition and properties of imidacloprid technical material (TC)

	Confidential information supplied and held on file by FAO. Mass balances were 99.6 – 99.7%.
Declared minimum imidacloprid content:	970 g/kg
Relevant impurities $\geq$ 1 g/kg and maximum limits for them:	None
Relevant impurities < 1 g/kg and maximum limits for them:	None
Stabilizers or other additives and maximum limits for them:	None
Melting temperature range (TC)	142-144 °C

#### Background information on toxicology/ecotoxicology

Bayer CropScience confirmed that the toxicological and ecotoxicological data included in Annex 1, below, were derived from imidacloprid having impurity profiles similar to those referred to in Table 2, above.

Imidacloprid was evaluated for toxicology by the FAO/WHO JMPR in 2001, which set the reference doses: ADI: 0.06 mg/kg bw/day; acute RfD: 0.4 mg/kg bw. Imidacloprid was evaluated for residues by the FAO/WHO JMPR in 2002, which recommended MRLs for 51 food commodities and assessed the dietary risks from longand short-term intake of residues as "unlikely to present a public health concern". Imidacloprid was evaluated by the U.S. EPA in 1992/93 and the results (imidacloprid compound (BAY NTN 33893 Techn.) – Registry No. EPA 3125-414, approval March 18, 1994) were published in the U.S. Federal Register in 1994. Residue tolerances were established (USEPA 1996).

The Bayer CropScience hazard phrases and classification are:

Harmful if swallowed Harmful to aquatic organisms Do not breathe dust Classification: Xn: harmful Harmful to honeybees by direct contact, but no problems expected when not sprayed into flowering crop or when used as seed treatment.

The WHO hazard classification of imidacloprid is Class II, moderately hazardous (WHO 2002).

#### Formulations

Imidacloprid is registered and marketed world-wide for use in more than 120 countries and on over 160 crops. The main formulation types are SL, SC, WG, WS and FS.

#### Methods of analysis and testing

The analytical methods for imidacloprid (including identity tests) in TC, GR, WG, WS, SC, FS, OD, SL are full CIPAC methods. The method for GR was published in CIPAC Handbook H. The methods for TC, WG, WS, SC, FS were published in CIPAC handbook K; extensions to OD and SL were adopted by CIPAC 2004 but are

not yet published. In these methods, imidacloprid is determined by reversed-phase HPLC, using external standardization and detection at 260 nm.

The analytical method for determination of impurities (Bayer method 2201-0308702-98) is also based on reversed-phase HPLC, using isocratic elution and UV-detection with certified reference substances for external standard calibration. Validation reports were provided.

Test methods for determination of physico-chemical properties of the technical active substance were OECD, USEPA or EC, while those for the formulations were CIPAC, as indicated in the specifications.

#### Containers and packaging

No special requirements for containers and packaging have been identified.

#### Expression of active ingredient

The active ingredient is expressed as imidacloprid, in g/kg in solid formulations, and in g/kg or g/l at  $20 \pm 2C$  in liquid formulations.

#### ANNEX 1

#### HAZARD SUMMARY PROVIDED BY THE PROPOSER

Note: The proposer provided written confirmation that the toxicological and ecotoxicological data included in the following summary were derived from imidacloprid having impurity profiles similar to those referred to in Table 2, above.

Species	Test	Duration and conditions	Result	Reference
Rat (m,f)	oral	single application; OECD 401, purity: 94.2%	LD <sub>50</sub> = 424 mg/kg bw (m) 450 mg/kg bw (f)	18594
Rat	dermal	single application 24 h; OECD 402, purity: 94.2%	LD₅₀ >5000 mg/kg bw	18594
Rat	inhalation	dust, 4 h exposure; OECD 403, purity: 95.3%	LC₅₀ >5323 mg/m³	16777
Rabbit	skin irritation	OECD 404, duration of expo- sure: 4 hours, purity: 94.2%	non-irritating	16455
Rabbit	eye irritation	OECD 405, duration of expo- sure: 24 hours, purity: 94.2%	non-irritating	16456
Guinea pig	skin sensitization	Maximization test, purity: 94.2%	non-sensitizing	16533

# Table B. Toxicology profile of imidacloprid technical material based on repeated administration (sub-acute to chronic)

Species	Test	Duration and conditions	Result	Reference
Rabbit	sub-acute, dermal	OECD 410, purity: 95.0%	NOAEL = 1000 mg/kg bw/day	19152
Rat	sub-acute, inhala- tion	OECD 412, purity: 95.2%	NOAEC = 5.5 mg/m³ air	18199
Dog	sub-acute, feeding	OECD 409, 4 weeks, purity: 92.8%	NOAEL = 7.3 mg/kg bw/day	R4196
Rat	sub-chronic, feeding	OECD 408, 13 weeks, purity: 92.8%	NOAEL = 11 mg/kg bw/day	17279

## Addendum Report

(FAO Specification 582/GR/2008) (CIPAC number 582)

#### Explanation

Imidacloprid data were provided in 2004 by Bayer CropScience to support specifications for imidacloprid TC, GR, WS, WG, SC, FS, OD, SL. The FAO specifications were published in 2006.

Supporting data for the extension of an existing specification (imidacloprid GR) were provided by Cheminova A/S in 2007. The Cheminova A/S granular formulations are prepared from Bayer CropScience technical material that complies with FAO specifications.

The Cheminova A/S granular formulations do not meet the existing GR specifications in two respects:

- colour of the granules; and

- upper limits for pour and tap density.

Data were provided to support proposed changes to the existing specifications for imidacloprid granules.

#### Recommendations

The Meeting recommended that:

- the specifications for imidacloprid GR be amended to include coloured granules and to accommodate wider ranges for pour and tap density.

#### Appraisal

Imidacloprid specifications for TC, GR, WS, WG, SC, FS, OD and SL were published

in 2006 after a data submission from Bayer CropScience. In 2007, Cheminova A/S requested an extension of the imidacloprid GR specification and provided supporting data.

The extension involves a change in description from "beige granules" to "beige or coloured" granules and to allow a wider range in pour and tap densities (upper limits to increase by 0.1 g/ml).

The granules from both manufacturers are manufactured from the same source of TC, but possibly different carrier materials, which may influence the density. The colouring is to assist observation of the granules on soil.

Neither change should influence the product performance.

#### SUPPORTING INFORMATION

#### Formulations and co-formulated active ingredients

The main formulation types available are SL, SC, WG, GR, FS and WS. In GR formulations, imidacloprid may be formulated alone or co-formulated with other active ingredients, such as organophosphate and pyrethroid insecticides. Cheminova's imidacloprid GR formulations are registered and sold in Great Britain.

#### Methods of analysis and testing

Analytical methods for the active ingredient are based on the methods and testing described in existing FAO specification for imidacloprid GR formulations (FAO Specification 582/GR (May 2006)) following the new procedure.

Test methods for determination of physico-chemical properties of the technical active ingredient were not applicable as TC utilized by Cheminova A/S for GR formulations originate from a manufacturer whose specification is already approved, while those for the formulations were CIPAC, as indicated in the specifications.

#### **Physical properties**

The physical properties, the methods for testing them and the limits proposed for the GR formulations, comply with the requirements described in the existing FAO specification for imidacloprid GR formulations (FAO Specification 582/GR (May 2006)) following the new procedure, with the following exceptions:

#### Colour

In the existing FAO specification for imidacloprid GR formulations (FAO Specification 582/GR (May 2006)) the material is described as "beige granules" (Refer to "1. Description", line 4 of FAO Specification 582/GR (May 2006)). It is proposed to change the wording to "beige or coloured granules".

Justification for change: granule formulations consist of a carrier material, such as silica, coated with imidacloprid. One of the uses is for soil treatment, where a colouring of the granules will help identify treated areas.

### Density

In the existing FAO specification for imidacloprid GR formulations (FAO Specification 582/GR (May 2006)) the density range of the formulations is stated as:

Pour density: 1.4 to 1.5 g/ml

Tap density: 1.5 to 1.6 g/ml

when determined in compliance with CIPAC MT 186, Handbook K, p. 151, 2003. It is proposed to extend the limits to:

Pour density: 1.4 to 1.6 g/ml

Tap density: 1.5 to 1.7 g/ml

when determined in compliance with CIPAC MT 186, Handbook K, p. 151, 2003.

Justification for change: The density of the formulation will to a high degree depend on the carrier material, such as silica. The density of these materials can vary. The limits in the existing FAO specification for imidacloprid GR formulations (FAO Specification 582/GR (May 2006)) are narrow, and the suggested extension will allow for additional suitable carriers to be available for formulation purposes.

#### **Containers and packaging**

No special requirements for containers and packaging have been identified.
