DISCLAIMER

FAO specifications are developed with the basic objective of ensuring that pesticides complying with them are satisfactory for the purpose for which they are intended so that they may serve as an international point of reference. The specifications do not constitute an endorsement or warranty of the use of a particular pesticide for a particular purpose. Neither do they constitute a warranty that pesticides complying with these specifications are suitable for the control of any given pest, or for use in a particular area. Owing to the complexity of the problems involved, the suitability of pesticides for a particular application must be decided at the national or provincial level.

Furthermore, the preparation and use of pesticides complying with these specifications are not exempted from any safety regulation or other legal or administrative provision applicable thereto. FAO shall not be liable for any injury, loss, damage or prejudice of any kind that may be suffered as a result of the preparation, transportation, sale or use of pesticides complying with these specifications. Additionally, FAO wishes to alert users of specifications to the fact that improper field mixing and/or application of pesticides can result in either a lowering or complete loss of efficacy. This holds true even where the pesticide complies with the specification. Accordingly, FAO can accept no responsibility for the consequences of improper field mixing and/or application.

FAO is not responsible for ensuring that any product claimed to comply with FAO specifications actually does so.

1 This disclaimer applies to all specifications published by FAO. Furthermore it does not undertake to insure anyone who utilizes these specifications against liability for infringement of any Letters Patent nor assume any such liability.
INTRODUCTION

FAO establishes and publishes specifications* for technical material and related formulations of plant protection products with the objective that these specifications may be used to provide an international point of reference against which products can be judged either for regulatory purposes or in commercial dealings.

FAO Specifications now only apply to products for which the technical materials have been evaluated. Consequently from the year 2000 onwards the publication of FAO specifications under the New Procedure has changed. Every specification consists now of two parts namely the specifications and the evaluation report(s):

PART ONE: The Specification of the technical material and the related formulations of the plant protection product in accordance with chapter 4, 5 and 6 of the 5th edition of the "Manual on the development and use of FAO specifications for plant protection products".

PART TWO: The Evaluation Report(s) of the plant protection product reflecting the evaluation of the data package carried out by FAO and the Panel of Experts. The data are to be provided by the manufacturer(s) according to the requirements of Appendix A, annex 1 or 2 of the "Manual on the development and use of FAO specifications for plant protection products" and supported by other information sources. The Evaluation Report includes the name(s) of the manufacturer(s) whose technical material has been evaluated. Evaluation reports on specifications developed subsequently to the original set of specifications are added in a chronological order to this report.

FAO Specifications under the New Procedure do not necessarily apply to nominally similar products of other manufacturer(s), nor to those where the active ingredient is produced by other methods of synthesis. FAO has the possibility to extend the scope of the specifications to similar products, but only when the Panel of Experts has been satisfied that the additional products are equivalent to those which formed the basis of the reference specification.
Footnote: The publications are available on the Internet under (http://www.fao.org/AG/AGP/AGPP/Pesticid/) or as hardcopy from the Plant Protection Information Officer.

BENSULFURON METHYL TECHNICAL MATERIAL

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (502/2002). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (502/2002) as PART TWO forms an integral part of this publication.

1 Description

The material shall consist of bensulfuron-methyl, together with related manufacturing impurities, and shall be a white to light yellow fine crystalline solid, free from visible extraneous matter and added modifying agents.

2 Active ingredient

2.1 Identity tests (502/TC/M/ CIPAC/4181) (Note 1)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

2.2 Bensulfuron-methyl content (502/TC/M/ CIPAC/4181) (Note 1)

The bensulfuron-methyl content shall be declared (not less than 975 g/kg) and, when determined, the average measured content shall not be lower than the declared minimum content.

________________________________

Note 1 Method adopted by CIPAC but not yet published. Prior to publication it is available from the CIPAC secretariat on request.
BENSULFURON-METHYL WETTABLE POWDERS

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (502/2002). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (502/2002) as PART TWO forms an integral part of this publication.

1 Description

The material shall consist of an homogenous mixture of technical bensulfuron-methyl, complying with the requirements of FAO specification 502/TC (2002), together with filler(s) and any other necessary formulants. It shall be in the form of a fine powder free from visible extraneous matter and hard lumps.

2 Active ingredient

2.1 Identity tests (502/WP/M/, CIPAC/4258) (Note 1)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

2.2 Bensulfuron-methyl content (502/WP/M/, CIPAC/4258) (Note 1)

The bensulfuron-methyl content shall be declared (g/kg) and, when determined, the average content measured shall not differ from that declared by more than the following tolerance:

<table>
<thead>
<tr>
<th>Declared content in g/kg</th>
<th>Permitted tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Above 100 up to 250</td>
<td>± 6% of the declared content</td>
</tr>
</tbody>
</table>

Note: the upper limit is included in this range.

3 Physical properties

3.1 Wet sieve test (MT 59.3)

Maximum: 2% retained on a 75 µm test sieve.

3.2 Suspensibility (MT 15.1, MT 177) (Note 2 and 3)
A minimum of 60% of the bensulfuron-methyl content found under 2.2 shall be in suspension after 30 min in CIPAC Standard Water D at 30 ± 2°C (Notes 4 & 5).

3.3 Persistent foam (MT 47.2) (Note 6)
Maximum: 60 ml after 1 minute

3.4 Wettability (MT 53.3.1) (Note 7)
The formulation shall be completely wetted in 1 minute without swirling.

4 Storage stability

4.1 Stability at elevated temperature (MT 46.3)
After storage at 54 ± 2°C for 14 days, the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 8) and the formulation shall continue to comply with the clauses for:
wet sieve test (3.1);
susceptibility (3.2);
wettability (3.4).

Note 1 Method adopted by CIPAC but not yet published. Prior to publication it is available from the CIPAC secretariat on request.

Note 2 The formulation should be tested at the highest and lowest rates of use recommended by the supplier, provided this does not exceed the conditions given in methods MT 15.1 or MT 177.

Note 3 This test will normally only be carried out after the heat stability test 5.1.

Note 4 Unless another temperature is specified.

Note 5 Chemical assay is the only fully reliable method to measure the mass of active ingredient still in suspension. However, simpler methods such as gravimetric and solvent extraction determination may be used on a routine basis provided that these methods have been shown to give equal results to those of chemical assay. In case of dispute, chemical assay shall be the "referee method".

Note 6 The mass of the sample to be used in the test should be at the highest rate of use recommended by the supplier.

Note 7 The product should be tested at 0.5g. Although this amount of test substance is well below the 5.0 gram sample size required by MT 53.3.1, it is still far in excess of the maximum concentration recommended for use and does constitute sufficient quantity to enable an accurate visual determination of wettability.

Note 8 Samples of the formulation taken before and after the storage stability test should be analyzed concurrently after the test in order to reduce the analytical error.
BENSULFURON-METHYL WATER DISPERSIBLE GRANULES

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (502/2002). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (502/2002) as PART TWO forms an integral part of this publication.

1 Description

The material shall consist of an homogenous mixture of technical bensulfuron-methyl, complying with the requirements of FAO specification 502/TC (2002), together with carriers and any other necessary formulants. It shall be in the form of granules for application after disintegration and dispersion in water. The formulation shall be dry, free-flowing, essentially non-dusty, and free from visible extraneous matter and hard lumps.

2 Active ingredient

2.1 Identity tests (502/WG/M/ CIPAC/4181) (Note 1)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

2.2 Bensulfuron-methyl content (502/WG/M/ CIPAC/4181) (Note 1)

The bensulfuron-methyl content shall be declared (g/kg) and, when determined, the average content measured shall not differ from that declared by more than the following tolerance:

<table>
<thead>
<tr>
<th>Declared content in g/kg</th>
<th>Permitted tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Above 500</td>
<td>± 25 g/kg</td>
</tr>
</tbody>
</table>

3 Physical properties

3.1 Wettability

The formulation shall be completely wetted in 10 sec., without swirling.

3.2 Wet Sieve Test (MT 167, MT 182)
Maximum: 2% retained on a 75µm test sieve.

3.3 **Degree of dispersion** (MT 174)
Dispersibility: minimum 70% after 1 minute stirring.

3.4 **Suspensibility** (MT 168) (Notes 2 & 3)
A minimum of 60% of the bensulfuron-methyl content found under 2.2 shall be suspension after 30 minutes in CIPAC Standard Water D at 30 ± 2°C (Note 4).

3.5 **Persistent foam** (MT 47.2) (Note 5)
Maximum: 60 ml after 1 min.

3.6 **Dustiness** (MT 171) (Note 6)
Essentially non-dusty

3.7 **Flowability** (MT 172)
A minimum of 99% of the product shall pass through a 5 mm test sieve after 20 drops of the sieve.

4 **Storage stability**

4.1 **Stability at elevated temperature** (MT 46.3)

After storage at 54 ± 2°C for 14 days the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 7) and the formulation shall continue to comply with the clauses for:
- wet sieve test (3.2);
- degree of dispersion (3.3);
- suspensibility (3.4);
- dustiness (3.6).

---

**Note 1** Method adopted by CIPAC but not yet published. Prior to publication it is available from the CIPAC secretariat on request.

**Note 2** The formulation should be tested at the highest and lowest rates of use recommended by the supplier, provided this does not exceed the conditions given in the method.
Note 3 Chemical assay is the only fully reliable method to measure the mass of active ingredient still in suspension. However, the simpler gravimetric method, MT 168, may be used on a routine basis provided that it has been shown to give equal results to those of chemical assay. In case of dispute, chemical assay shall be the “referee method”.

Note 4 Unless another temperature is specified.

Note 5 The mass of the sample to be used in the test should be specified at the highest rate recommended by the supplier.

Note 6 Measurement of dustiness must be carried out on the sample “as received” and, where practicable, the sample should be taken from a newly opened container, because changes in the water content of samples may influence dustiness significantly. The optical method, MT 171, usually shows good correlation with the gravimetric method and can, therefore, be used as an alternative where the equipment is available. Where the correlation is in doubt, it must be checked with the formulation to be tested. In case of dispute the gravimetric method shall be used.

Note 7 Analysis of the formulation before and after storage stability test, should be carried out concurrently (i.e. after storage) to minimize the analytical error.
PART TWO

2000 EVALUATION REPORT FOR BENSULFURON-METHYL

BENSULFURON-METHYL

2002 Evaluation report based on submission of data from E.I. du Pont de Nemours and Company (TC, WP, WG)
FAO SPECIFICATIONS AND EVALUATIONS FOR
PLANT PROTECTION PRODUCTS

BENSULFURON-METHYL

EVALUATION REPORT 502/2002

Explanation
The data for bensulfuron-methyl were evaluated in support of new FAO specifications.

Bensulfuron-methyl has not been evaluated by the FAO/WHO JMPR or WHO/IPCS. Draft FAO specifications were initially presented in September 1999 and resubmission was rescheduled for September 2001. The draft specification and the supporting data were provided by E. I. du Pont de Nemours and Company in September 2001.

Bensulfuron-methyl is under patent in Greece until March 2003. A complete dossier will be submitted to the EU for evaluation in May 2004, with Italy assigned as rapporteur member state.

Uses
Bensulfuron-methyl is a selective pre-emergence and post-emergence herbicide that inhibits the formation of acetolactate synthase (ALS inhibitor). It is used in rice against many annual and perennial broadleaf weeds and sedges.

b Study results provided have not been previously reported to a regulatory agency but were considered by the WHO/PCS secretariat. The studies are scheduled to be submitted to Italy in May 2004.

---

a An impurity reported to FAO (DHD34) has not been previously reported to a regulatory body. It was recently discovered as the result of improvements in chromatographic separation and product quality.
Toxicological summaries

Notes.

(i) The proposer confirmed that the toxicological and ecotoxicological data included in the summary below were derived from bensulfuron-methyl having impurity profiles similar to those referred to in the table above.

(ii) The conclusions expressed in the summary below are those of the proposer, unless otherwise specified.

(iii) Study results provided reflect current data but additional studies are, or will soon be, in progress. The new data were not available to the JMPS but the studies are scheduled to be submitted to Italy in May 2004.

<sup>b</sup> Study results provided have not been previously reported to a regulatory agency but were considered by the WHO/PCS secretariat. The studies are scheduled to be submitted to Spain in May 2003.
Bensulfuron-methyl has not been evaluated by the WHO IPCS or by the FAO/WHO JMPR and it has not been classified according to IPCS hazard. Bensulfuron-methyl does not exceed the criteria established in the Recommendations on the Transport of Dangerous Goods (published by the United Nations Committee of Experts on the Transport of Dangerous Goods) and, therefore, is not considered as dangerous/hazardous for transportation purposes.

**Formulations**

The main formulation types available are water dispersible granules (WG) and wettable powders (WP). These formulations are registered and sold in many countries throughout the world.

**Methods of analysis and testing**

The analytical methods for the active ingredient (including identity tests) are 502/TC/M/, 502/WG/M/ (CIPAC/4181) and 502/WP/M/, (CIPAC/4258), (full CIPAC methods) (reference 5). The bensulfuron-methyl is determined by reversed-phase HPLC, using UV detection at 236 nm and internal standardisation. The methods for determination of impurities are based on reversed-phase HPLC, using UV detection at 235 nm and external standardisation. Test methods for determination of physico-chemical properties of the technical active ingredient were OECD, EPA, EEC, and CIPAC while those for the formulations were CIPAC, as indicated in the specifications.

**Physical properties**

The physical properties, the methods for testing them and the limits proposed for the WP and WG formulations, comply with the requirements of the FAO Manual (5th edition). The wettability test (CIPAC MT 53.3.1) should be conducted using a sample of 0.5 grams. Although this amount of test substance is well below the 5.0 gram sample size required by the method, it is still in far excess of the maximum concentration recommended for use. However, it is a sufficient quantity to enable an accurate visual determination of wettability.

**Containers and packaging**

There are no special container or packaging requirements.

**Expression of the active ingredient**

The active ingredient is expressed as bensulfuron-methyl.

**Appraisal**

Bensulfuron-methyl exhibits low vapour pressure, the water solubility is pH-dependent, with the highest solubility at higher pH values due to the formation of water-soluble salts (2.1 mg/l at pH 5 and 3100 mg/l at pH 9). Bensulfuron-methyl hydrolyses rapidly at pH 4 but is stable at pH 7 and 9 at 25°C. Cleavage of the sulfonoylurea linkage is the primary hydrolytic degradation pathway. The photolysis characteristics are pH dependent. At pH 4, hydrolysis is so much more rapid than the slow photolysis that photolysis makes no significant
contribution to the rate of degradation under these conditions. Bensulfuron-
methyl is stable to direct photolysis in sterile buffer solutions, but degrades
rapidly via cleavage of the sulfonylurea linkage in natural water under sunlight.
The apparent difference in hydrolysis rates observed in the "dark photolysis" and
"hydrolysis" studies is not significant due to the variability in results obtained in
the studies and the consequent errors in estimation of hydrolysis half-life. The
octanol:water partition coefficient indicates a low potential for bio-accumulation.
The technical material is not classified for explosive, oxidising or flammable
properties.

Bensulfuron-methyl is a systemic sulfonylurea herbicide for the pre- and post
emergence control of annual and perennial broad-leaved and sedge weeds in
rice. Bensulfuron methyl is selective acting, through foliar and root uptake, by
inhibiting biosynthesis of the essential amino acids valine and isoleucine. It stops
cell division by inhibition of the acetolactate synthase enzyme. The application
rate of the substance is low, with typical application rates of 50 to 60 g ai/ha. The
application timing depends on the geographical area and is typically applied at 2-
to 3-leaf stage of the rice.

The data submitted were in accordance with the requirements of the FAO Manual
(5th edition) and supported the draft specifications.

The data summary submitted by the proposer in support of the physico-chemical,
toxicological and ecotoxicological properties were in accordance with those
evaluated as part of the Hungarian registration of bensulfuron-methyl, except for
certain study results that have not been previously reported to a regulatory
agency and are considered new data (namely: solubility in water; hydrolysis
characteristics; dissociation characteristics; water flea 48-hour acute toxicity;
algal growth inhibition; earthworm 14-day acute toxicity; rainbow trout 96-hr.
acute toxicity; bluegill sunfish 96-hr. acute toxicity; honey bee acute contact
toxicity; male and female mallard ducks 1-generation reproduction study).

These studies are scheduled to be submitted to the EU in May 2004 in support of
a new EU registration and were considered by the WHO/PCS secretariat for the
present evaluation. The PCS secretariat noted that the studies were performed
using recommended methodologies, and according to good laboratory practice
and that accurate summaries of the study results were provided in in support of
the proposed specifications. In the opinion of WHO/PCS, the apparent
discrepancies in the hydrolysis characteristics presented in Table 1 were due to
the fact that in the experiment, performed in accordance with the OECD
guideline, the longest hydrolysis time studied was 30 days, and thus any half-life
reported in excess of approximately 200 days is very uncertain (<10% hydrolysis)
and all such half-lives in the table should be considered to be >200d.

The main formulation types available are water dispersible granules (WG) and
wettable powders (WP).

The Meeting was provided with commercially confidential information on the
manufacturing process and batch analysis data on all impurities present at or
above 1 g/kg. These data were identical to those submitted to for registration in
Hungary, except for the recently discovered impurity, DHD34, discovered as the
result of improved chromatographic separations. Among the impurities included
in the data package initially submitted to FAO in October 2001, were four
compounds identified as JF987, L8399, F6135 and KW557, which had only been included for the purpose of manufacturing quality control limits at 1 g/kg. As these non-relevant impurities always appear at levels well below the 1 g/kg limit, and are only used as process monitoring tools, the meeting disregarded them. Mass balances were 99.8 – 100.4 % and the minimum purity of the technical material of the two production plants was 990 g/kg, according to the 10-batch data.

The purity of the technical material used in the toxicological studies was 94-98.66%. The improvements in overall efficiency of manufacture has translated into a material with higher minimum purity. (96.5% to 97.5%). As the overall process has remained the same, the impurity profile on a qualitative basis also remains unchanged.

The proposer considered the technical material used in recent studies to be both historically representative of bensulfuron-methyl synthesis processes as well as directly representative of material that is currently being distributed and sold commercially.

Bensulfuron-methyl is of low acute, subacute and chronic toxicity. It is rapidly metabolised and eliminated from mammalian systems; the primary metabolic pathway include hydroxilation and O-demethylation. The active substance and metabolites do not accumulate in tissues. Bensulfuron-methyl is non-irritant to eyes and not skin sensitizing. The compound is non-teratogenic and is not considered to be a mutagen.

Bensulfuron-methyl has not been evaluated by the WHO IPCS or by the FAO/WHO JMPR. The IPCS hazard classification is: “unlikely to present acute hazard in normal use”. The WHO toxicity class (a.i.) is III, the EPA toxicity class (formulation) is IV. The classification following EU is Xi (R43).

Bensulfuron-methyl is very toxic to aquatic organisms (N R 50/53 ECB) and may cause long-term adverse effects in the aquatic environment. Classification is driven by the algae toxicity endpoint, according to Annexes I, II, III, IV to Commission Directive 93/21/EEC of 27 April 1993. Bensulfuron-methyl is moderately toxic to honey bees, but in normal use is unlikely that there will be significant risks to bees.

The HPLC method for bensulfuron-methyl TC and WG formulations CIPAC/4181, and the method for WP formulations, CIPAC/4258, have been adopted as full CIPAC methods. (CIPAC/4265/P). Test methods for determination of physico-chemical properties of the technical active ingredient and formulations were OECD and CIPAC, as indicated in the specifications.

**Recommendations**

The meeting recommended that the draft specifications for the bensulfuron-methyl technical material, water dispersible granules and wettable powders should be adopted by FAO.
