## PART TWO

- 2002 EVALUATION REPORT FOR NICLOSAMIDE | 16 |
Disclaimer ¹

FAO specifications are developed with the basic objective of promoting, as far as practicable, the manufacture, distribution and use of pesticides that meet basic quality requirements. Compliance with the specifications does not constitute an endorsement or warranty of the fitness of a particular pesticide for a particular purpose, including its suitability for the control of any given pest, or its suitability for use in a particular area. Owing to the complexity of the problems involved, the suitability of pesticides for a particular purpose and the content of the labelling instructions must be decided at the national or provincial level.

Furthermore, pesticides which are manufactured to comply with these specifications are not exempted from any safety regulation or other legal or administrative provision applicable to their manufacture, sale, transportation, storage, handling, preparation and/or use. FAO disclaims any and all liability for any injury, death, loss, damage or other prejudice of any kind that may be arise as a result of, or in connection with, the manufacture, sale, transportation, storage, handling, preparation and/or use of pesticides which are found, or are claimed, to have been manufactured to comply with these specifications.

Additionally, FAO wishes to alert users to the fact that improper storage, handling, preparation and/or use of pesticides can result in either a lowering or complete loss of safety and/or efficacy.

FAO is not responsible, and does not accept any liability, for the testing of pesticides for compliance with the specifications, nor for any methods recommended and/or used for testing compliance. As a result, FAO does not in any way warrant or represent that any pesticide claimed to comply with a FAO specification actually does so.

¹ This disclaimer applies to all specifications published by FAO.
INTRODUCTION

FAO establishes and publishes specifications* for technical material and related formulations of agricultural pesticides with the objective that these specifications may be used to provide an international point of reference against which products can be judged either for regulatory purposes or in commercial dealings.

Since 1999 the development of FAO specifications follows the New Procedure, described in the 5th edition of the "Manual on the development and use of FAO specifications for plant protection products" (FAO Plant Production and Protection Page No. 149). This New Procedure follows a formal and transparent evaluation process. It describes the minimum data package, the procedure and evaluation applied by FAO and the Experts of the FAO/WHO Joint Meeting on Pesticide Specifications (JMPS). [Note: prior to 2002, the Experts were of the FAO Panel of Experts on Pesticide Specifications, Registration Requirements, Application Standards and Prior Informed Consent, which now forms part of the JMPS, rather than the JMPS.]

FAO Specifications now only apply to products for which the technical materials have been evaluated. Consequently from the year 2000 onwards the publication of FAO specifications under the New Procedure has changed. Every specification consists now of two parts namely the specifications and the evaluation report(s):

**Part One**: The Specification of the technical material and the related formulations of the plant protection product in accordance with chapter 4, 5 and 6 of the 5th edition of the “Manual on the development and use of FAO specifications for plant protection products”.

**Part Two**: The Evaluation Report(s) of the plant protection product reflecting the evaluation of the data package carried out by FAO and the JMPS. The data are to be provided by the manufacturer(s) according to the requirements of Appendix A, annex 1 or 2 of the “Manual on the development and use of FAO specifications for plant protection products” and supported by other information sources. The Evaluation Report includes the name(s) of the manufacturer(s) whose technical material has been evaluated. Evaluation reports on specifications developed subsequently to the original set of specifications are added in a chronological order to this report.

FAO specifications under the New Procedure do not necessarily apply to nominally similar products of other manufacturer(s), nor to those where the active ingredient is produced by other routes of manufacture. FAO has the possibility to extend the scope of the specifications to similar products but only when the JMPS has been satisfied that the additional products are equivalent to that which formed the basis of the reference specification.

* Footnote: The publications are available on the Internet under (http://www.fao.org/WAICENT/FAOINFO/AGRICULT/AGP/AGPP/Pesticid/) or as hardcopy from the Plant Protection Information Officer.

NICLOSAAMIDE

INFORMATION

Common names
Niclosamide (for niclosamide: E-ISO, [m] F-ISO)
Niclosamide olamine (for niclosamide olamine: E-ISO, [m] F-ISO)

Synonyms
Niclosamide (BAN, Germany for veterinary use)
Niclosamide olamine (BAN)
Clonitralid (Germany for niclosamide olamine in public health use)

Chemical names
IUPAC
2′,5-dichloro-4′-nitrosalicylanilide
CA
5-chloro-N-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide

Structural formula

Molecular formulae
$C_{13}H_8Cl_2N_2O_4$ (niclosamide)
$C_{15}H_{15}Cl_2N_3O_5$ (niclosamide-olamine)

Relative molecular masses
327.1 (niclosamide)
388.2 (niclosamide-olamine)

CAS Registry numbers
50-65-7 (niclosamide)
1420-04-8 (niclosamide-olamine)

CIPAC code numbers
599 (niclosamide)
599.110 (niclosamide-olamine)
1 Description

The material shall consist of niclosamide together with related manufacturing impurities, in the form of a yellowish to grey-greenish powder, free from visible extraneous matter and added modifying agents.

2 Active ingredient

2.1 Identity tests (CIPAC 599/TC/M/2, CIPAC/4113)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, it shall comply with at least one additional test.

2.2 Niclosamide content (CIPAC 599/TC/M/3, CIPAC/4113)

The niclosamide content shall be declared (not less than 960 g/kg) and, when determined, the mean measured content shall not be lower than the declared minimum content.

3 Relevant Impurities

3.1 Water (CIPAC MT 30.5)

Maximum: 10 g/kg.
NICLOSAMIDE OLAMINE TECHNICAL CONCENTRATE

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (599/2002). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (599/2002) as PART TWO forms an integral part of this publication.

1 Description

The material shall consist of niclosamide, complying with the requirements of FAO specification 599/TC (2002), in the form of the ethanolamine (olamine) salt, together with related manufacturing impurities, in the form of a yellowish to brownish powder, free from visible extraneous matter and added modifying agents.

2 Active ingredient

2.1 Identity tests (CIPAC 599/TK/M/2, CIPAC/4113)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, it shall comply with at least one additional test. (Note 1)

2.2 Niclosamide content (CIPAC 599/TK/M/3, CIPAC/4113)

The niclosamide content shall be declared (not less than 800 g/kg) and, when determined, the average measured content shall not differ from that declared by more than ± 25 g/kg.

Note 1 The TK (niclosamide) and TC (niclosamide olamine) may be distinguished by means of IR spectroscopy.
NICLOSAMIDE EMULSIFIABLE CONCENTRATE

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (599/2002). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (599/2002) as PART TWO forms an integral part of this publication.

1 Description

The material shall consist of technical niclosamide, complying with the requirements of FAO specification 599/TC (2002), dissolved in suitable solvents, together with any other necessary formulants. It shall be in the form of a stable homogeneous liquid, free from visible suspended matter and sediment, to be applied as an emulsion after dilution in water.

2 Active ingredient

2.1 Identity tests (CIPAC 599/EC/M/2, CIPAC/4113)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, it shall comply with at least one additional test.

2.2 Niclosamide content (CIPAC 599/EC/M/3, CIPAC/4113)

The niclosamide content shall be declared (g/kg or g/l at 20 ± 2 °C, Note 1) and, when determined, the average measured content shall not differ from that declared by more than the tolerance, given below.

<table>
<thead>
<tr>
<th>Declared content, g/kg or g/l at 20 ± 2°C</th>
<th>Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>above 100 up to 250</td>
<td>± 6% of the declared content</td>
</tr>
</tbody>
</table>

Note: the upper limit is included in the range
3 Physical properties

3.1 Emulsion stability and re-emulsification (CIPAC MT 36.1.1) (Note 2)

The formulation, when diluted at 30 ± 2 °C (Note 3) with CIPAC standard waters A and D, shall comply with the following:

<table>
<thead>
<tr>
<th>Time after dilution</th>
<th>Limits of stability</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 h</td>
<td>Initial emulsification: complete</td>
</tr>
<tr>
<td>0.5 h</td>
<td>&quot;Cream&quot;, maximum: 0.5 ml</td>
</tr>
<tr>
<td>2.0 h</td>
<td>&quot;Cream&quot;, maximum: 0.5 ml</td>
</tr>
<tr>
<td>24 h</td>
<td>&quot;Free oil&quot;, maximum: 0.5 ml</td>
</tr>
<tr>
<td>24.5 h</td>
<td>Re-emulsification: complete</td>
</tr>
<tr>
<td>Note: Tests after 24 h are required only where results at 2 h are in doubt</td>
<td></td>
</tr>
</tbody>
</table>

3.2 Persistent foam (CIPAC MT 47.2) (Note 4)

Maximum: 25 ml after 1 min.

4 Storage stability

4.1 Stability at 0 °C (CIPAC MT 39.3)

After storage at 0 ± 2°C for 7 days, the volume of solid and/or liquid which separates shall not be more than 0.3 ml.

4.2 Stability at elevated temperature (CIPAC MT 46.3)

After storage at 54 ± 2 °C for 14 days, the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 5) and the formulation shall continue to comply with the clause for emulsion stability and re-emulsification (3.1).

Note 1 If the buyer requires both g/kg and g/l at 20°C, then in case of dispute the analytical results shall be calculated as g/kg.

Note 2 This test will normally only be carried out after the heat stability test, 4.2.

Note 3 Unless another temperature is specified.

Note 4 The test should be carried out at the highest application concentration.

Note 5 Samples of the formulation taken before and after the storage stability test should be analyzed concurrently after the test in order to reduce the analytical error.
NICLOSAMIDE OLAMINE AQUEOUS SUSPENSION CONCENTRATE

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (599/2002). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (599/2002) as PART TWO forms an integral part of this publication.

1 Description
The material shall consist of a suspension of fine particles of technical niclosamide olamine, complying with the requirements of FAO specification 599.110/TK (2002), in an aqueous phase together with suitable formulants. After gentle agitation the material shall be homogeneous (Note 1) and suitable for further dilution in water.

2 Active ingredient
2.1 Identity tests (CIPAC 599/SC/M/2, CIPAC/4113)
The active ingredient shall comply with an identity test and, where the identity remains in doubt, it shall comply with at least one additional test.

2.2 Niclosamide content (CIPAC 599/SC/M/3, CIPAC/4113)
The niclosamide content shall be declared (g/kg or g/l at 20 ± 2 °C, Note 2) and, when determined, the content measured shall not differ from that declared by more than the tolerance, given below.

<table>
<thead>
<tr>
<th>Declared content, g/kg or g/l at 20 ± 2°C</th>
<th>Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>above 250 up to 500</td>
<td>± 5% of the declared content</td>
</tr>
</tbody>
</table>

Note: the upper limit is included in the range

3 Physical properties
3.1 Pourability (CIPAC MT 148.1)
Maximum residue: 5%.

3.2 Spontaneity of dispersion (CIPAC MT 160) (Note 3)
A minimum of 95% of the niclosamide content found under 2.2 shall be in suspension after 5 min in CIPAC standard water D at 30 ± 2 °C (Note 4).

3.3 Suspensibility (CIPAC MT 184) (Note 3)
A minimum of 97% of the niclosamide content found under 2.2 shall be in suspension after 30 min in CIPAC standard water D at 30 ± 2 °C (Note 4).
3.4 **Wet sieve test** (CIPAC MT 59.3) (Note 5)

Maximum: 0.02% of the formulation shall be retained on a 75 µm test sieve.

3.6 **Persistent foam** (CIPAC MT 47.2) (Note 6)

Maximum: 40 ml after 1 min.

4 **Storage stability**

4.1 **Stability at 0 °C** (CIPAC MT 39.3)

After storage at 0 ± 2 °C for 7 days, the formulation shall continue to comply with clauses for suspensibility (3.3) and wet sieve test (3.4), as required.

4.2 **Stability at elevated temperature** (CIPAC MT 46.3) (Note 7)

After storage at 40 ± 2 °C for 8 weeks, the determined average active ingredient content must not be lower than 98% relative to the determined average content found before storage (Note 8) and the formulation shall continue to comply with the clauses for: pourability (3.1), spontaneity of dispersion (3.2), suspensibility (3.3) and wet sieve test (3.4).

---

**Note 1** Before sampling to verify the formulation quality, inspect the commercial container carefully. On standing, suspension concentrates usually develop a concentration gradient from the top to the bottom of the container. This may even result in the appearance of a clear liquid on the top and/or of sediment on the bottom. Therefore, before sampling, homogenize the formulation according to the instructions given by the manufacturer or, in the absence of such instructions, by gentle shaking of the commercial container (for example by inverting the closed container several times). Large containers must be opened and stirred adequately. After this procedure, the container should not contain a sticky layer of non-dispersed matter at the bottom. A suitable and simple method of checking for a non-dispersed sticky layer "cake" is by probing with a glass rod or similar device adapted to the size and shape of the container. All the physical and chemical tests must be carried out on a laboratory sample taken after the recommended homogenization procedure.

**Note 2** Unless homogenization is carried out carefully, it is possible for the sample to become aerated. This can lead to errors in the determination of the mass per millilitre and in calculation of the active ingredient content (in g/l) if methods other than MT 3.3 are used. If the buyer requires both g/kg and g/l at 20 °C, then in case of dispute the analytical results shall be calculated as g/kg.

**Note 3** Chemical assay is the only fully reliable method to measure the mass of active ingredient still in suspension. However, simpler methods such as gravimetric and solvent extraction determination may be used on a routine basis provided that these methods have been shown to give equal results to those of the chemical assay method. In case of dispute, the chemical method shall be the referee method.

**Note 4** Unless other temperatures and/or times are specified.

**Note 5** This test detects coarse particles (e.g. caused by crystal growth) or agglomerates (crust formation) or extraneous materials which could cause blockage of spray nozzles or filters in the spray tank.

**Note 6** The mass of sample to be used in the test should be specified at the maximum application rate of use recommended by the supplier.
**Note 7** The storage is conducted at 40°C for 8 weeks because, at 54°C for 2 weeks, crystal growth occurs. Storage temperatures are unlikely to reach 54°C even in hot climates and therefore the lower temperature and longer time interval provides an acceptable test for this product. Niclosamide itself is chemically stable under both conditions.

**Note 8** Samples of the formulation taken before and after the storage stability test should be analyzed concurrently after the test in order to reduce the analytical error.
NICLOSAMIDE OLAMINE WETTABLE POWDER

This specification, which is PART ONE of this publication, is based on an evaluation of data submitted by the manufacturer whose name is listed in the evaluation report (599/2002). It should be applicable to relevant products of this manufacturer but it is not an endorsement of those products, nor a guarantee that they comply with the specifications. The specification may not be appropriate for the products of other manufacturers. The evaluation report (599/2002) as PART TWO forms an integral part of this publication.

1 Description

The material shall consist of an homogeneous mixture of technical niclosamide olamine, complying with the requirements of FAO specification 599.110/TK (2002), together with filler(s) and any other necessary formulants. It shall be in the form of a fine powder, free from visible extraneous matter and hard lumps.

2 Active ingredient

2.1 Identity tests (CIPAC 599/WP/M/2, CIPAC/4113)

The active ingredient shall comply with an identity test and, where the identity remains in doubt, shall comply with at least one additional test.

2.2 Niclosamide content (CIPAC 599/WP/M/3, CIPAC/4113)

The niclosamide content shall be declared (g/kg) and, when determined, the content measured shall not differ from that declared by more than the appropriate tolerance, given in the table below.

<table>
<thead>
<tr>
<th>Declared content, g/kg or g/l at 20 ± 2°C</th>
<th>Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>above 250 up to 500</td>
<td>± 5% of the declared content</td>
</tr>
<tr>
<td>above 500</td>
<td>± 25 g/kg</td>
</tr>
<tr>
<td>Note: the upper limit is included in the lower range</td>
<td></td>
</tr>
</tbody>
</table>

3 Physical properties

3.1 Wet sieve test (MT 59.3)

Maximum: 2 % retained on a 75 µm test sieve.

3.2 Suspensibility (MT 184) (Notes 1 & 2)

A minimum of 60% of the niclosamide content found under 5.11.2.2 shall be in suspension after 30 min in CIPAC standard water D at 30 ± 2°C (Notes 3 & 4).

3.3 Wettability (MT 53.3)
The formulation shall be completely wetted in 1 min without swirling.

3.4 **Persistent foam** (MT 47.2) (Note 5)

Maximum: 85 ml after 1 min.

4 **Storage stability**

4.1 **Stability at elevated temperature** (MT 46)

After storage at 54 ± 2°C for 14 days, the determined average active ingredient content must not be lower than 95% relative to the determined average content found before storage (Note 6) and the formulation shall continue to comply with the clauses for: wet sieve test (3.1), suspensibility (3.2) and wettability (3.3).

---

**Note 1**  The formulation should be tested at the highest and lowest rates of use recommended by the supplier, provided this does not exceed the conditions given in methods MT 15.1 or MT 177.

**Note 2**  This test will normally only be carried out after the heat stability test 4.1.

**Note 3**  Unless another temperature is specified.

**Note 4**  Chemical assay is the only fully reliable method to measure the mass of active ingredient still in suspension. However, simpler methods such as gravimetric and solvent extraction determination may be used on a routine basis provided that these methods have been shown to give equal results to those of chemical assay. In case of dispute, chemical assay shall be the “referee method”.

**Note 5**  The mass of sample to be used in the test should be at the highest rate of use recommended by the supplier.

**Note 6**  Samples of the formulation taken before and after the storage stability test should be analyzed concurrently after the test in order to reduce the analytical error.
PART TWO

EVALUATION REPORTS

NICLOSAamide

2002 Evaluation report based on submission of data from Bayer AG. (TC, TK, EC, SC, WP)
Explanation
The data for niclosamide were evaluated in support of new FAO specifications and for review in revision of existing WHO specifications.

Niclosamide is not under patent.

Niclosamide was evaluated by WHO and FAO in 1988 and the information was published in “Data Sheet on Pesticides, No. 63, Niclosamide” (WHO/VBC/DS/88.63). This publication contains data on niclosamide, its ethanolamine salt, its piperazine salt and its hydrate. Further information on the compound and its formulations is available in the WHO documents WHO/SMF/6, WHO/SMF/4.R1, WHO/SMF/4.R2, WHO/SMF/2R2 and WHO/SMF/1.R3. Niclosamide was evaluated by the US EPA in 1999 and the results were published in Reregistration Eligibility Decision (RED) fact sheet number EPA-738-R-99-007. The data for the US EPA RED fact sheets were provided by the US-Fish and Wildlife Service, part of the US Department of the Interior, to whom Bayer AG provided all data on Niclosamide and its formulations in 1990.

The draft specification and the supporting data for the evaluation were provided by Bayer AG in 1987/1988.

Uses
Niclosamide is a lampricide and molluscicide. It kills a wide variety of snails, cestodes and Cercariae by affecting the respiration and the carbohydrate metabolism. It probably disturbs oxidation processes by inhibiting oxygen uptake. The main target pest in agricultural use is the golden apple snail (Pomacea canaliculata) in paddy fields (rice-cultivation) but it is also applied in public health and hygiene programs to control/eradicate snails such as Biomphalaria glabrata, which are intermediate hosts for Schistosoma spp., the infectious agents of schistosomiasis in open waters in tropical Africa. The pesticide is quickly metabolized in water and does not exhibit a long-term effect (Andrews et al, 1983).

It is also applied to commercially managed fish ponds, in order to clean them from undesirable fish prior to re-filling the pond. Niclosamide is highly toxic to fish but, due to its short half-life in water, the batch of new fish may be added only a few days after application of the pesticide.
Identity

Common names

Niclosamide (for niclosamide: E-ISO, [m] F-ISO)
Niclosamide olamine (for niclosamide olamine: E-ISO, [m] F-ISO)

Synonyms

Niclosamide (BAN, Germany for veterinary use)
Niclosamide olamine (BAN)
Clonitralid (Germany for niclosamide olamine in public health use)

Chemical names

IUPAC
2’,5-dichloro-4’-nitrosalicylanilide

CA
5-chloro-N-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide

Toxicological summaries

Notes.

(i) The proposer confirmed that the toxicological and ecotoxicological data included in the summary below were derived from niclosamide having impurity profiles similar to those referred to in the table above.

(ii) The conclusions expressed in the summary below are those of the proposer, unless otherwise specified.

Data from WHO data sheet on pesticides, no.63, WHO/VBC/DS/88.63
Hazard Summary

Hazard classification of niclosamide:
- irritating to eyes
- very toxic to aquatic organisms
- do not breathe dust
- classification: Xi: irritant
- N: dangerous for the environment

WHO hazard classification: “Unlikely to present acute hazard in normal use.”

Formulations

The main formulation types available are EC, WP and SC. These formulations are registered and sold in China, Taiwan, Philippines, Thailand, Malaysia, Indonesia and the Dominican Republic.

Methods of analysis and testing

The analytical method for the active ingredient (including identity tests) is a full CIPAC method (CIPAC/4113). Niclosamide is determined by reversed-phase HPLC, using UV detection at 236 nm and external standardisation.

The method for determination of impurities (Bayer method 2201-0313801-98) is based on reversed-phase LC, using UV detection and external standardisation. The components are separated by HPLC with isocratic elution. The quantitative evaluation is carried out after UV detection by means of the peak areas with external standard by comparison with reference substances. Alternatively the by-products can be determined with substance-specific area correction factors referring to the calibration of the main component niclosamide. Validation reports were not available.

Test methods for determination of physico-chemical properties of the technical active ingredient were OECD, EPA, EC, while those for the formulations were CIPAC methods, as indicated in the specifications.

Physical properties

The physical properties, the methods for testing them and the limits proposed for the EC, SC, WP formulations, comply with the requirements of the FAO Manual (5th edition).

Containers and packaging

No special requirements for containers and packaging were identified.

Expression of the active ingredient

The active ingredient is expressed as niclosamide (free acid).

Appraisal
Niclosamide was evaluated by WHO and FAO in 1988. WHO specifications for the TC, TK, WP and EC were last revised 10 December 1999. A data package on niclosamide, its salts (ethanoamine and piperazine) and hydrate was published in “Data Sheet on Pesticides, No. 63, Niclosamide” (WHO/VBC/DS/88.63).

The data submitted in support of the specifications were in accordance with the requirements of the FAO Manual (5th edition).

Niclosamide is a single compound. It has very low solubility in water at pH 4, with the solubility slightly increasing as the pH increases. The compound is stable in sterile water at pH 5 to 8.7, but subject to photolysis by long wavelength ultraviolet light. The vapour pressure of niclosamide is very low. It is very quickly metabolized in water and does not exhibit a long-term effect.

Niclosamide is a lampricide and molluscicide, formulated as the EC, SC or WP from the TC or TK (olamine salt). It is distributed in Asia and the Dominican Republic. It is registered (olamine salt only and formulations) under data supplied to the U.S. Fish and Wildlife Service (U.S. Department of the Interior).

The meeting was provided with commercially confidential information on the manufacturing process and batch analysis data on all impurities present at or above 1g/kg. None of the impurities was considered to be relevant, except water in the TC (because it is used to prepare the EC), while unknowns ranged from 0.2 to 0.3%. In the five batch analyses, mass balances were 98.6 to 100.2%. These data were declared to be essentially identical to those submitted in China, Taiwan, Thailand, Philippines, Indonesia, Malaysia and the Dominican Republic.

Niclosamide exhibits low acute oral, dermal and inhalation toxicity, as indicated by the data package submitted. The compound is irritating to the skin, especially at high doses, and strongly irritating to the eye. Skin sensitization observations vary from low to moderate.

Mutation study results from Salmonella microsome tests have been both positive and negative, while studies in other test systems (point mutation/eucaryontes, micronucleus and dominant lethal) have all been negative. Summary study results provided indicate no evidence for carcinogenicity, embryo toxicity or teratogenicity.

Niclosamide technical and formulations are analyzed by the full CIPAC HPLC method (CIPAC/4113), which is applicable to TC, TK, EC and WP. The proposer has validated the extension of the method to the SC. Identity tests are HPLC retention time and IR spectrum. The olamine salt (TK) can be distinguished from the TC by the IR method.

The persistent foam test (MT 47.2) for the 70 WP gives results (85 ml after 1 min) above the FAO guideline but many years of field experience by WHO with this product have indicated no problems with actual use. The test of stability at elevated temperature is carried out at 40ºC (MT 46.3); however, actual use has not resulted in complaints and no limit on use in hot climates has been found to be necessary. Crystal growth, not niclosamide degradation, is the problem at 54ºC. Thus, although crystal growth might result in an adverse wet sieve test after storage at 54ºC, blockage of sprayer filters and nozzles has not been reported in actual field use over many years in tropical countries.
Impurities are analyzed by isocratic HPLC, although validation reports were available at the time of evaluation. No relevant impurities other than water in the TC were identified by the meeting.

**Recommendations**

The meeting recommended adoption of the proposed specifications for niclosamide TC, TK, EC, SC and WP as new FAO specifications and recommended adoption of the specifications for TC, TK, EC and WP as revised WHO specifications.
