Viet Nam has experienced sustained growth in per-capita GDP and Dietary Energy Supply (DES) in recent years, as well as a sustained decline in undernourishment rates.

Viet Nam has seen sharp declines in underweight and stunting. However, anemia represents a persistent issue, particularity among pregnant women and children under 5 years of age.

Exclusive breastfeeding prevalence is low; however, a recent extension of maternity leave and ban on advertising of breastmilk substitutes have the potential to help to increase exclusive breastfeeding.

**Key Indicators**

- Stunting
- Wasting

**Figure 1.1 Food Availability**

*From 1990 to 2011:*
- DES increased 42%
- Animal-origin supply increased 230%
- Vegetal-origin products increased 23% and remain the major DES source

**Figure 1.2 Undernourishment and Economic Growth**

*From 1990 to 2012:*
- GDP per capita increased 227%
- Undernourishment declined 83%

**Figure 1.3 Child Malnutrition**

*From 1993 to 2011:*
- Stunting declined 62%
- Underweight declined 67%
- In 2011, Wasting stood at 4%
- Overweight increased to 4%

**Figure 1.4 Child Mortality**

*From 1990 to 2012:*
- Under-5 mortality reduced 54% and will not achieve the Millennium Development Goal (MDG) target
- Infant mortality reduced 49%
- Neonatal mortality reduced 45%

**Figure 1.5 Anaemia**

- Anaemia is a public health issue for pregnant women (32%), non-pregnant women (24%) and under-5 children alike (29%); it is a severe issue among under-2 children (52%)

**Anthropometry (Table 1.1)**

Source: General Nutrition Survey 2009-2010/MICS 2010-2011
Although cereals remain the most important source of food energy, their contribution declined from 70% in 1990 to 57% in 2011.

While animal fats doubled their availability (229%) and meat and milk increased by 242%.

During the global food crisis in 2008, food prices increased 37% while general prices increased 23%.

In 2011:
- Families generally spent more than 42% of their income on food. While cereals contributed a significant share (39%) of food intake, they only affected 6% of food expenditure at household level.
- Meat, milk, and eggs contribute 18% of food intake.

Viet Nam - Food and Nutrition Security Profiles

Food Utilization

Food utilization refers both to household preparation practices of foods, which influence nutrient content of consumed foods, and to the absorption of nutrients by the human body after consumption. Nutrient absorption in the gut is strongly influenced by health status, particularly the presence of diarrhoea. Hygienic environmental conditions related to improved water and sanitation are important determinants of health and infection incidence and prevalence. In Viet Nam, water and sanitation conditions have improved during the past 20 years; these improvements have contributed to the reduction in malnutrition among under-5 children shown in Fig 1.3.

Water and Sanitation

**Figure 3.1 Access to Improved Sanitation**
From 1990 to 2012:
- Access to improved sanitation increased 101% in 22 years
- Disparities between rural and urban areas continue, although they have decreased to 22%
- 25% of the population does not have access to improved sanitation

**Figure 3.2 Open Defecation**
From 1990 to 2012:
- Open defecation decreased 95% in 22 years
- The practice still occurs in 3% of rural households.

**Figure 3.3 Access to Improved Water Sources**
From 1990 to 2012:
- Disparities between urban and rural areas in access to improved water sources have been significantly reduced
- At least 95% of the population has sustainable access to improved water

Food Safety

Quality and food safety efforts cover the entire complex chain of agriculture production, processing, transport, food production and consumption. On the production side, food safety challenges exist at farm level and in the processing stage. On the consumption side, the prevalence of diarrhoea among under-5 children is relatively low for all wealth quintiles (Fig 3.4).

**Figure 3.4 Diarrhoea**
- Diarrhoea in young children is most common among the poorest wealth quintiles, reflecting disparities in sanitation as well as in general hygiene and food safety
- Only 1% of children younger than age 5 receive zinc treatment during episodes of diarrhoea. Chronic diarrhoea in children can lead to stunting, underweight and death.

**Nutrition and Health**

**Figure 3.5 Exclusive Breastfeeding**
- From 1997 to 2011, Exclusive breastfeeding for first six months of age has not changed and about 4 out of 5 of infants are not exclusively breastfed
- More than half of the newborn borns are breastfed within the first hour of life

**Source:** Nutrition Surveillance Profiles 2013/ VNM_MICS 2010-2011

**Figure 3.6 Complementary Feeding**
- Introduction of complementary feeding (46%) is not timely for most children.
- 87% of children aged 6-23 months meet the minimum meal frequency and 82% meet adequate diversity.
- Two thirds of children (66%) got the minimum acceptable diet.

**Source:** a. Nutrition Surveillance Profiles 2013/ b. MICS 2010-2011

**Figure 3.7 Duration of Breastfeeding**
- Duration and frequency of breastfeeding affect the health and nutritional status of both mother and child.
- Exclusive breastfeeding is recommended up to age 6 months, and continued breastfeeding with complementary feeding is recommended from age 6 months until 2 years and beyond

**Source:** Nutrition Surveillance Profiles 2013/ VNM_MICS 2010-2011

**Figure 3.8 Child Malnutrition and Poverty**
- Stunting, underweight and wasting are more common in the lower wealth quintiles.
- Overweight is more than 4 times more prevalent in the wealthiest quintile than in the poorest.

**Source:** VIET NAM MICS 2011

**Micronutrient Status**

**Figure 3.9 Vitamin A**
- Successful Vitamin A supplementation (98%) is a likely contributor to the observed reductions in child mortality.
- Vitamin A deficiencies (12% of pre-schoolers) indicate that Vitamin A has significantly improved in the daily diet.

**Iodine (Table 3.2)**
- Households consuming adequately iodized salt (2011)a: 45%
- Iodine deficiency (Urinary Iodine Concentration <100µg/L) among school-age children: -

**Source:** a/ Viet Nam MICS 2011

*VAD is a severe public health problem if >20% of preschool children (6-23 months) have low serum Retinol (<0.7µmol/L).*

<tr>
<th>Policy</th>
<th>Aims and Policies</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Party Resolution 15-NQ/T.U on key social policy issues, 2012-2020</td>
<td>Range of policies aiming at providing basic social security for all, prioritizing disadvantaged, poor and ethnic minorities, ensuring minimum levels in income and basic needs including reduction of malnutrition of US children to lower than 10% by 2020</td>
</tr>
<tr>
<td>2. Resolution 80/NQ-CP on sustainable poverty reduction during 2011-2020</td>
<td>Range of policies focusing on increased income per capita of poor households, including food subsidies (15 kg rice pp/mo), targeting elderly, disabled, women and children in poor districts and remote areas.</td>
</tr>
</tbody>
</table>
### Food Safety policies or legislation

1. **Viet Nam National Food Safety Law - 2010**
   
   The law specifies tasks along the food chain and management responsibility and coordination mechanisms of related government agencies and sanctioning of violations. Under this law, MoH developed technical standards for food additives, and micronutrient fortification.

2. **Vietnam Food Safety and Agricultural Health Action Plan - 2011**
   
   Plan under the National Strategy on Food Hygiene and Safety 2011-2020 and the vision to 2030.

### Other policies addressing food security

1. **Resolution No 63/ NQ-CP on National Food Security - National strategy of food security to 2020 and vision 2030.**
   
   Aims to protect rice land and further step up intensive rice farming and productivity, especially in Mekong and Red river deltas.

2. **Resolution No.24/2008/NQ-CP On the issuance of Action Plan**
   
   Resolution on Agriculture and Rural development for the uplifting targets development and modernization of agriculture to ensure food security; considering aspects of human resources, socio-economic infrastructure, environment and culture and disaster risk reduction.
