

Animal Health Service AGAH

SIB
Swiss Institute of
Bioinformatics

From OPENFLU to OPENFMD

*a resource for automatic and
curated nomenclature and tools for the
FMD community*

Filip Claes, Philippe Le Mercier, Dmitry Kuznetsov, Robin Liechti,
Anne Gleizes, Ioannis Xenarios, Gwenaëlle Dauphin

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

Animal Health Service AGAH

Conclusions and recommendations

- Complete collection of FMDV (genetic) data is necessary for:
 - Surveillance of disease evolutionary trends
 - Scientific analysis
 - Infer gaps in epidemiological data
- OPENFLU-EMPRESi experience may be useful for FMDV community
- OPENFMD might become a central portal for the community to store and share FMDV data - and move towards harmonized nomenclature

Animal Health Service AGAH

OpenFLU - an open database of influenza data

- <http://openflu.vital-it.ch/>
- Contains only public data
- All data are accessible for browsing
- All users are welcome
 - standard free web registration is needed to upload and manage own or laboratory data

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

Animal Health Service AGAH

OpenFLU: an adequate data model for Influenza virus

- Sequences grouped per isolates
- Isolates accompanied by a comprehensive record of data for epidemiology:
 - Minimal data required: year, host species, country
 - Support for much more data: vaccination, patient status, resistance to antibiotics, animal domestication status, etc...
- Influenza-specific genetic knowledge and algorithms
 - Translation to viral proteins
 - Key mutations

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

Animal Health Service AGAH

OpenFLU: data import/export

- Import:
 - GENBANK
 - USER SUBMISSIONS
- CURATION !
- Export: GenBank, data as a structured comment

NCBI → SIB

GenBank → OpenFlu

Animal Production and Health Division

Epidemiological information

- On outbreaks: date, location, species,...
- On surveillance
- Generated by field teams the day of the event, compiled and reported by vet services (epi unit) within a short time
- Stored in databases: local, national, regional, global

Animal Health Service AGAH

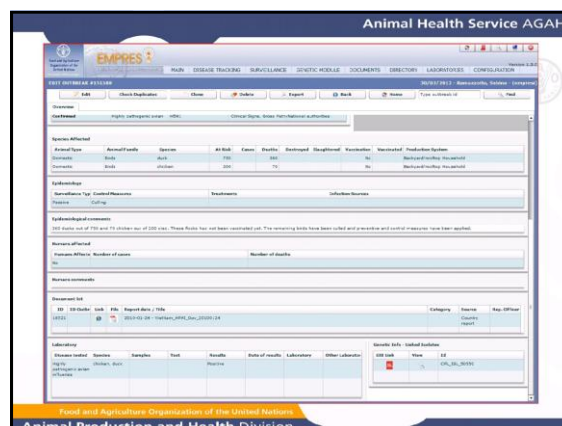

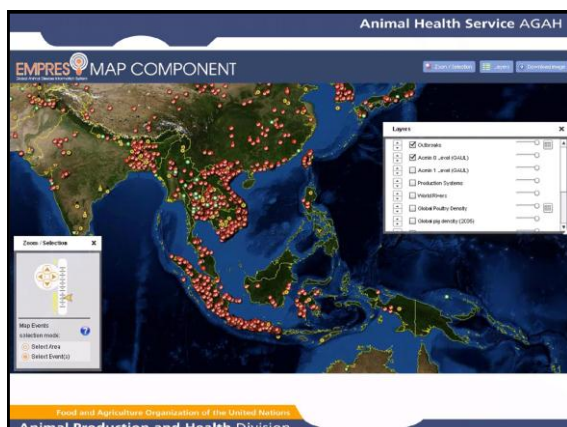

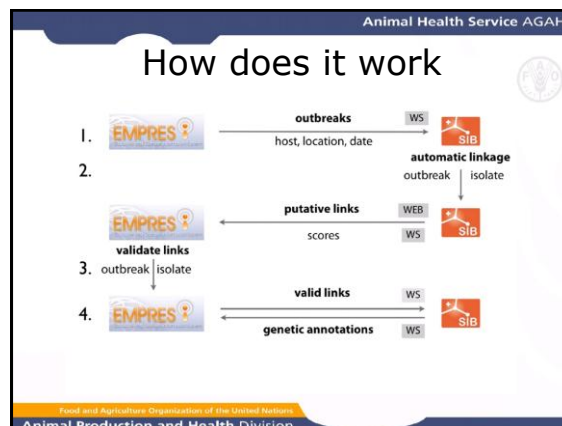

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

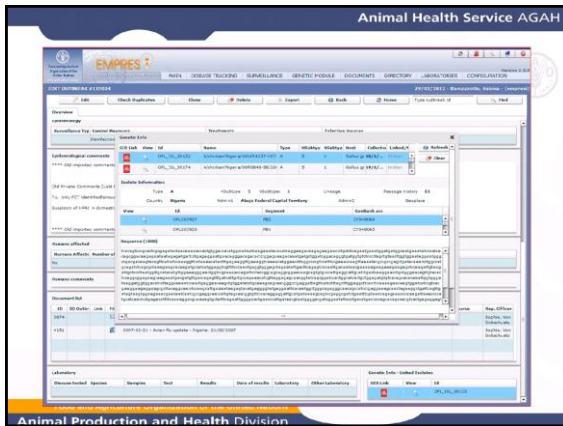

Animal Health Service AGAH

Virus information

- Generated by labs:
 - Detection of influenza virus, subtyping, RNA sequencing
 - Can take a few days (more)
- Sequence information deposited in a database
 - Genbank: universal repository
 - Other genetic databases, eg influenza specialized

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

OpenFMD: the project

- A public database that will
 - Store FMDV sequences and epidemiological data from various sources
 - Import from public repositories (like GenBank)
 - Direct user submission
 - Verify data consistency (e.g. control of user-submitted serotype by sequence similarity vs. collections of reference strain sequences)
 - Eventually manually curate records
 - Analyse data using tools like phylo-trees or SSM
 - Serve all the curated and organized data together with analysis results back to the FMDV community
 - Towards a harmonized nomenclature (with parallel current names)

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

OpenFMD: a live DB

- To be daily synchronized with all data sources
- GenBank (EFetch) allows data export in computer-friendly form (XML) suitable for daily incremental updates
- Precision of epidemiological data varies, but GenBank team collects and merges author's updates
- Authors might also correct/update data directly
- Already >4000 (full and partial) sequences available in GenBank

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

OpenFMD: a sandbox trial

- FMDV specific data model
- Simplified partial GenBank import
- 257 full genome sequences
- All 7 serotypes
- 2 un-typed sequences
 - one is "HKN/2002"

SEROTYPE	SEROSUBTYPE	CNT
A		72
Asia 1		41
C	1,3,4,5	17
O		113
SAT	1	10
SAT	2	5
SAT	3	5
-N/A-		2

OpenFMD: SSM try-out

Color-coded by the available from GenBank serotype data

- N/A
- A
- Asia 1
- C 1,3,4,5
- O
- SAT 1,2,3

http://ssm.vital-it.ch/

Food and Agriculture Organization of the United Nations
Animal Production and Health Division

OpenFMD: a closer look on the map for the type O

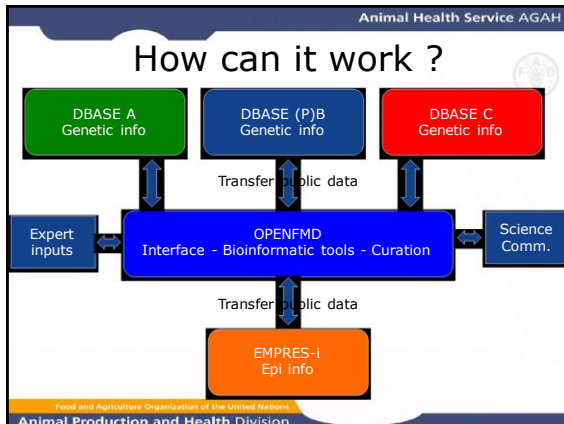

- Clusters (topotypes)
- No more precise annotation in the GenBank records
- No serotype for "HKN/2002" (pink)
- The serotype can be inferred from its neighbors, i.e. "O"

Foot-and-mouth disease type O viruses exhibit genetically and geographically distinct evolutionary lineages (topotypes)

Fig. 1. O FMDV tree showing the relationships between the HKN type O viruses (boxed) and other viruses (no right bracket). Based on a comparison of the 111 nucleotides of the VP1 gene.

The phylogenetic tree from Samuel and Knowles, J Gen Virol 2001, vol. 82 no. 3 (609-621)

OpenFMD: HNK/2002 serotype?

Available online at www.sciencedirect.com

ELSEVIER *Biomedical and Biophysical Research Communications* 323 (2004) 234–263

BBRC www.bbrc.com/submit.htm

Genome comparison of a novel foot-and-mouth disease virus with other FMDV strains

Qian Feng^a, Huan Yu^b, Yingying Liu^a, Chengqiang He^a, Jingsong He^a, Huachun Sang^a,
Neizheng Ding^a, Mingxiao Ding^a, Yin-Wan Wendy Fung^{a,c}, Lok-Ting Lau^{a,c},
Albert Cheung-Hoi Yu^{a,c}, Jianguo Chen^{a,d,*}

HNK/2002 belongs to serotype O

Sequence analysis of HKN/2002 with 26 other reported FMDV genomes indicates that the novel HKN/2002 strain is of serotype O. Fig. 1 shows a neighboring-joining (NJ) tree constructed based on the sequence alignment of these 27 genomes, which are distinctly divided into five serotypes. HKN/2002 is tightly clustered
