FOREWORD

Since 1950 FAO has prepared and advocated decennial programmes for the World Census of Agriculture (WCA). The 2000 Programme was the sixth in the series. These programmes on one hand serve to promote availability of internationally comparable data on the structure of agriculture; on the other hand they provide methodological guidance to countries in collecting data, following standard concepts, definitions and classifications.

FAO member countries provide the reports of their agricultural censuses to the FAO Statistics Division. These reports serve as the basis for preparation of internationally comparable data and for methodological studies related to the carrying out of an agricultural census. The FAO Statistics Division concurrently disseminates the key data on the structure of agriculture and related metadata obtained from the country census reports thorough its website. At the end of each round it publishes a main report, consolidating the global information on the structure of agriculture. For the WCA 2000 round, this report is prepared in three publications. The first report, which is a consolidated reproduction of country summaries already disseminated through the website, has already been published as FAO Statistical Development Series 12. The present publication, which is the second in the series, presents internationally comparable data on selected variables characterizing the structure of agriculture. The third report, relating to a methodological review of the WCA 2000 round is also being published along with this book.

There are no statistics without limitations. This fact makes the task of international comparisons arduous and challenging. Comparisons of data at the international level are marked by variations in concepts, definitions and approaches followed by countries to suit their national requirements. Regarding data on structure of agriculture, the limitations relate to: time reference, definition of agricultural holding adapted by countries to keep the cost and effort of the census under manageable limits, and scope and the coverage of the census. Wherever sampling design is adopted to carry out an agricultural census, an additional element of variation is introduced by sampling errors. Often, for international comparisons, there is a need to convert the units of measurement of national data. Such a conversion, when applied to a given distribution of holdings by size of land, disturbs the limits of the size classes. The resulting data need to be aligned to international standards using assumptions and interpolation methods.

One can note that the number of international comparison tables presented in this publication are substantially higher than the number of those published for the WCA 1990 round. Although our staff has made its best efforts to cover as large number of variables in this publication, from as many countries as possible, no claim is made about completeness of data at global or regional levels due to unavailability of information from some countries. Subject to the above limitations, it is expected that the comprehensive tabulations presented in this publication will serve as useful reference material for policy makers and researchers who are interested in development of agriculture and agrarian reform. The FAO Statistics Division takes pride in providing this unique publication covering information from a record number of 114 countries, and conveys appreciation for the National Statistical Offices which provided their census reports to us.

Pietro Gennari

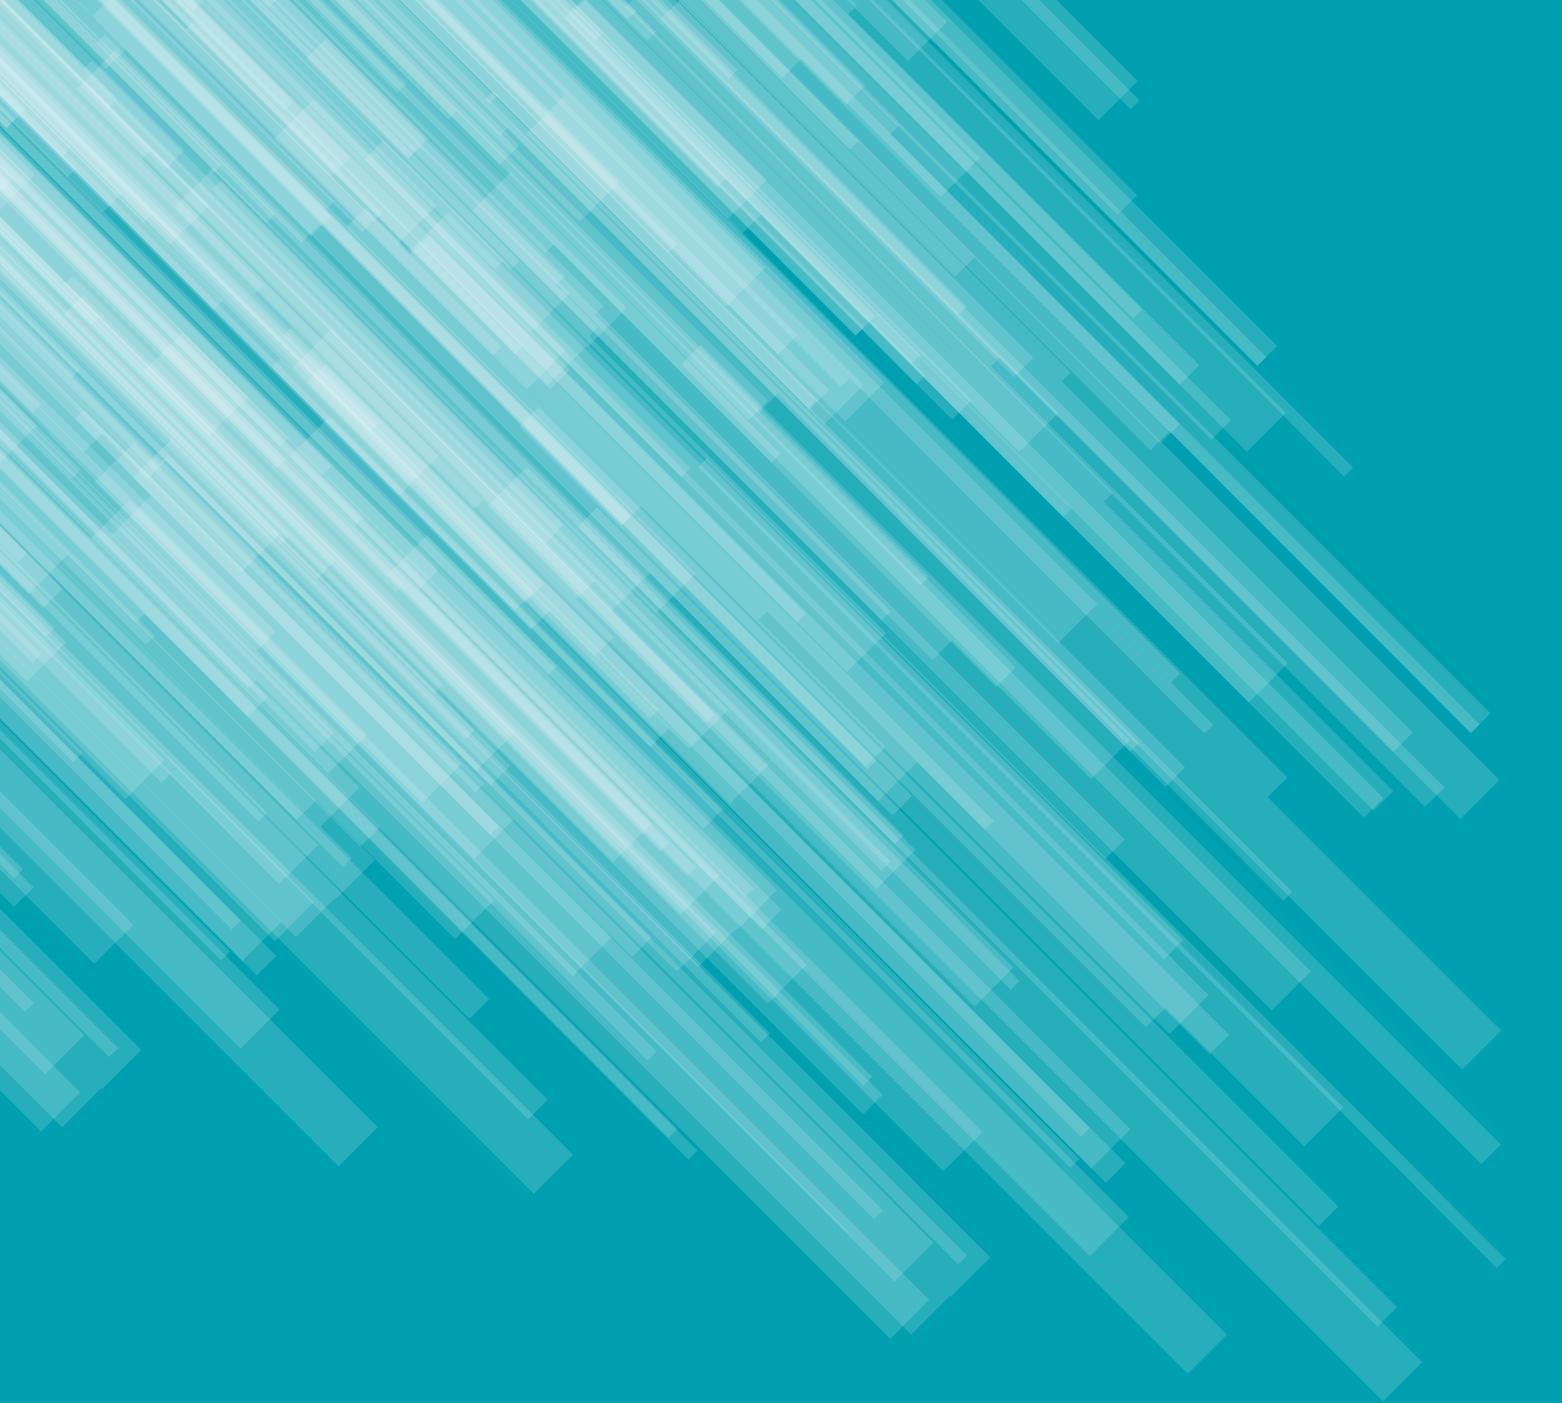

The Director
Statistics Division

ACKNOWLEDGEMENTS

This publication has been possible due to the efforts of a dedicated team of staff and experts lead by Mukesh K. Srivastava, Team Leader, Agricultural Censuses and Surveys. Franco Stefanelli, statistical clerk, was the key member of staff responsible for summarizing reports from the national agricultural censuses, studying the feasibility of comparison tables and participating in discussions on complex conceptual issues related to the data presented in this publication. Adriana Neciu, Consultant, followed up on the initial work of database preparation to bring the publication to its final shape. Jean Viseur, retired FAO Statistician responsible for the WCA, reviewed the draft tables and prepared an initial draft of this publication. Crina Turtoi, Consultant, did the final review of tables with a view to making them consistent and for suggesting indicators to draw meaningful conclusions. The publication also had the benefit of advice from Miguel Galmes and Giorgi Kvinikadze. Kenneth Basham provided valuable inputs by way of proof reading and suggesting editorial improvements. Marianne Sinko and Tomaso Lezzi carried out the layout of the publication. Thanks are also due to Migena Cumani, GIS consultant, for preparing the maps included in this publication.

PART ONE

Report on the
2000 World Census of Agriculture

CHAPTER I

Introduction

1.1 Background

1.1.1 The first Programme for the World Census of Agriculture (WCA) was developed for the years 1929-1930 by the International Institute of Agriculture (IIA) and implemented in about 60 countries. The IIA intended to conduct a second Programme for 1940 with much wider coverage, but the Second World War interfered with its full implementation.

1.1.2 FAO, having succeeded the IIA, took over the task of organizing the World Census of Agriculture and continued with the preparation and advocacy of successive decennial programmes. Each Programme benefitted from the experience of the previous ones, both from the methodological and the operational point of view. The 1950 programme restricted the scope of those relating to 1930 and 1940. The next programmes, however, re-expanded the scope of the census and introduced some methodological improvements, whilst keeping the structure of agriculture as the central theme.

1.1.3 The Programme for the 2000 WCA round was the eighth decennial international census programme. It defined a Census of Agriculture as "*a large-scale, periodic, statistical operation for the collection of quantitative information on the structure of agriculture*" and continued to elaborate: "*the word 'census' implies a complete enumeration of all agricultural holdings. However, by extension, it can be conducted by a sample enumeration, provided the sample is large enough to generate sub-national data*".

1.1.4 This publication is part of the series of reports and reviews prepared at the end of each WCA round. However, bearing in mind the coverage of countries and the available data in this round, the traditional contents of the reports on the WCA rounds have been divided into two publications. The individual country results and the metadata on the country censuses are presented in the accompanying publication "2000 World Census of Agriculture: Main results and Metadata by Country (1996 – 2005)" (FAO, 2010). Besides the key statistical information on the structure of agriculture in each country, the publication provides one page of metadata on the census of the country including *Historical outline, Institutional arrangements, Enumeration period, Reference date, Definitions, Coverage, Sampling frame, Methods, Data source, Mailing address of responsible organization and Website* etc. These pages can also be accessed from the website of FAO Statistics Division¹.

1.1.5 A separate volume "2000 World Census of Agriculture: Methodological Review" (FAO, 2013) will present an analysis of the methodological aspects of the censuses carried out during the 2000 WCA round, which covered the censuses undertaken by countries during the decade: January 1st, 1996 – December 31st, 2005. The publication will present a review of main data collected, methods and techniques for collection, processing and dissemination of census data, and selected country examples to highlight the best practices. The publication has been written principally for planners of agricultural censuses.

1.1.6 This publication presents a comparison of data (not without limitations) received from different countries. It provides selected data on number and area of holdings (classified by land-size of holding, if available), gender of the holder, farm population, employment, land tenure, land use, main crops, livestock, irrigation and machinery and equipment. In addition to thematic tables presented in PART TWO of the publication, the key findings are presented in Chapter 4. Maps and charts are used to highlight the key conclusions.

¹ FAO Statistics Division: <http://www.fao.org/economic/ess/en/>

1.1.7 Census data at the national level are available in diverse forms and language. Effort was made by the FAO Statistics Division to collect, validate and standardize to present these in a comparable format using the terminology and classifications of the *FAO Programme for the WCA 2000*, to the best extent possible. Users are, nonetheless, advised to carefully use the data bearing in mind the limitations and warnings mentioned in Chapter 3 of the publication.

1.1.8 The data presented here relates to the 2000 WCA round. As per information available at the time of preparation of the report, some 122 countries had conducted an agricultural census during the period (including those which collected similar information in their population censuses); nevertheless this report has been prepared on the basis of the results from the 114 countries and territories for which census reports were made available to FAO.

1.2 General characteristics of the 2000 World Census of Agriculture

1.2.1 The 2000 Programme (FAO, 1995. § 1.17) had three main features:

- Uniformity in concepts, definitions and classifications with those of other data sources was promoted. To the extent possible concepts and definitions proposed for the census were compatible with those recommended by other UN organisations. For example, definitions adopted for the concepts such as "household" and "occupation" conformed to those recommended by the United Nations Statistics Division (UNSD).
- It was recommended to limit the data coverage within the census. Given the scale, resources requirement, field management, enumeration skills and data processing implications, this limitation was considered essential to ensure the success of the census.
- In relation to the previous WCA Programme, changes had been kept to a minimum. Some changes were necessary to reflect changing priorities and to improve the presentation and analysis of data. In the 2000 WCA basic data items to address "gender" and "environmental" dimension of agriculture were introduced. The need for geo-referenced data was also realized.

1.2.2 In a broad sense "census of agriculture" refers to a nationwide large scale operation for collecting, processing, analysing and disseminating agricultural structural information. In that sense an agricultural census may be conducted through complete enumeration or sampling or a combination of both. When a large sample survey is conducted to generate sub-national data, the FAO Programme refers to it as "sample enumeration". However, for the purpose of reaching an extensive international comparison, the present publication covers information from censuses carried out both through complete enumeration and sampling. Information on the design of censuses adopted in specific countries could be obtained in FAO, 2010 and FAO, 2011a.

1.2.3 The Programme for the WCA 2000 established three basic objectives of a census (FAO, 1995. § 4.1):

- To provide aggregate totals for fundamental agricultural data to use as benchmarks for inter-census estimates.
- To provide a frame for other agricultural sample surveys.
- To provide data for small administrative units and detailed cross-classifications of farm structural attributes.

1.2.4 Regarding the census scope (the data items on which information is to be collected), the Programme for the WCA 2000 identified eight broad items (FAO, 1995. § 4.8): 1) Location of holding; 2) Legal status of holder; 3) Purpose of production; 4) Integration of holding with other enterprises engaged in other economic activity (ies); 5) Basic demographic characteristics of the holder and the household; 6) Inventory of production factors; 7) Tenure arrangements for production factors; 8) Other features.

1.2.5 The data item on "Inventory of production factors" was further enumerated as covering:

- source of manpower used on the holding (family workers, hired agricultural workers);
- number and area of land parcels;
- area by land use;
- area harvested, by crop;
- number of cultivated trees by crop;

- number of livestock by type;
- type of machinery and equipment used;
- number of forest trees on the holding; and
- agricultural buildings.

1.2.6 The “tenure arrangements” for production factors referred to land tenure and source of machinery and equipment used. The other features on which data was proposed to be collected included: (1) Shifting cultivation, (2) Use of irrigation, drainage, fertilizers, pesticides and high yielding variety seeds, (3) Fishery or forestry activities, if carried out on the holding, and (4) Livestock system.

1.2.7 The above mentioned scope has been maintained from the previous census Programme. Whilst the Programme advocates to not include in the census many aspects relevant to agriculture not suitable for collection in a multi-purpose single enumeration, such as production, yields, etc, some countries did take advantage of the census exercise to produce information on non-structural items of practical consideration. On the other hand, some subjects included in the census scope according to the FAO Programme were sometimes disregarded by countries because they were not relevant to them.

1.3 Regional groupings and availability of data from censuses

1.3.1 In order to capture the broad structural tendencies in different regions the data collected from the census reports of the countries has been grouped in regions. The grouping of countries in different regions has been done in conformity with that used in earlier publications in the FAO Statistical Development Series. This country grouping by regions follows UNSD standards on composition of macro geographical (continental) regions viz. Africa, Americas, Asia, Europe, and Oceania. However, to be able to draw meaningful conclusions from the analysis of country practices, the countries in Americas have been classified into two groups: “America, North and Central (including Caribbean countries)” and “America, South” which is consistent with the division into sub-regions proposed by UNSD. Bearing in mind the membership of FAO, the location of territories and their identity, the countries and territories have been classified into the region of their location. Purely for statistical purposes, no distinction has been made between “countries” and “territories” in this publication and both are referred to as “countries”.

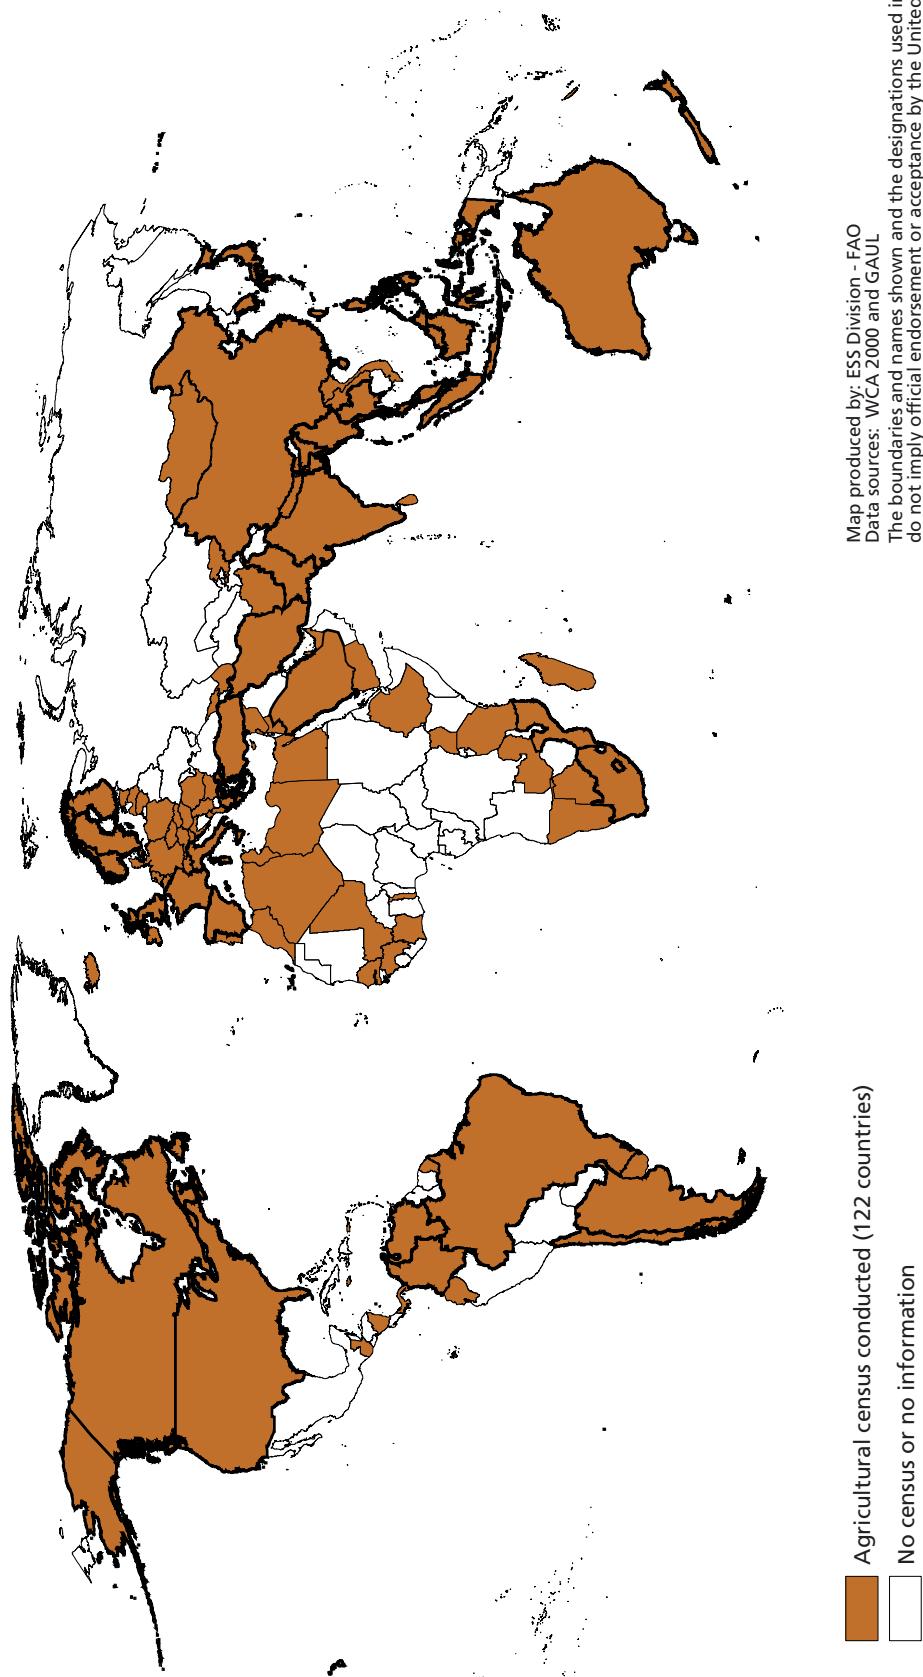

1.3.2 A review of the data collected by countries indicates that most countries include the data items on land, crops, livestock taken from their agricultural censuses. While 83 out of 114 countries included in the review have collected information on the demography of the household managing the holding, only 57 countries are reported to have collected information on legal status of the holdings. The information on number of holdings managed by civil persons is available for a bigger number of countries than the area managed by these holdings. The area of holdings by legal status is not tabulated and published in many reports even in some European countries, even though most countries collect data on legal status of the holding. The information on the legal status of the holder is conspicuously scanty in the censuses carried out in Africa.

1.3.3 There is a lack of availability of information on forms of land tenure in Africa, perhaps due to a variety of conventional land tenure types which are often not precisely defined in legal terms. Some 76 countries out of 114 countries collected data on employment on holdings but less than half of these countries collected information on “household members engaged in agriculture”. Although countries collect information on existence of building and structure on the holdings, no comparison is possible at international level due to lack of information on area under the farm buildings. Most censuses focus on estimating area allocated to crops, and the area under buildings etc. is grouped together with other areas including ponds.

1.3.4 Only a third of countries collected information on farm machinery. Attempts were made to prepare comparable data on “number of tractors” held by the agricultural holding. It was observed that countries often do not distinguish between the types of tractors (e.g. 4 wheeled tractors and track laying tractors) and their capacity. The availability of data from agricultural censuses on “water and irrigation” is very poor. Only some 15 countries collected information on “holding area that received irrigation” and even a smaller number of countries report on “number of holdings receiving irrigation”. The information on “other non-agricultural activities of the holding” was collected in less than one quarter of the censuses under review. As these activities are of local importance, no international comparison of the data was carried out.

CHAPTER 2. Participation of Countries in the 2000 WCA Round

Map 1.
Countries that conducted an agricultural census during the WCA 2000 round (1996-2005)

Map produced by: ESS Division - FAO
Data sources: WCA 2000 and GAUL
The boundaries and names shown and the designations used in this map
do not imply official endorsement or acceptance by the United Nations.

CHAPTER 2

Participation of Countries in the 2000 WCA Round

2.1 Increasing participation of the countries

2.1.1 This publication summarizes and compares information from 114 countries and territories² whose reports were made available to FAO till the time of finalization of this publication. This includes 25 countries in Africa, 29 countries each in Asia and Europe, 14 countries of North and Central America, 8 countries in South America, and 9 countries in Oceania region. In order to enhance the scope of comparison of structure of agriculture among the FAO member countries, the publication has also included the data from 6 countries which did not carry out an agricultural census, in the strict sense of the term, but have instead used alternative methods for obtaining data normally collected through agricultural censuses. The countries like Serbia³³, Seychelles, Uganda and Zambia used their population censuses to collect structural data on agriculture. Afghanistan and Mongolia carried out a livestock census. The annual livestock census of Mongolia is not strictly a census or a survey as it is based on a reporting system. However, given the importance of a large population of livestock in the country, it was considered appropriate to include the country in the related comparison tables.

2.1.2. Table 1.2 in PART TWO of the publication lists participation of countries in different rounds of the WCA beginning with 1930. Summary Table 1 below depicts the trends in the number of countries participating in the different rounds in different regions since the first round in 1930.

Table 1. Number of countries participating in the WCA rounds

Region	WCA round						
	1930	1950	1960	1970	1980	1990	2000
Total number of FAO members as the end of each round	—	70	109	132	154	173	189
Total number of participating countries	55	81	100	111	103	90	114
Africa	8	17	28	25	23	20	25
America, North and Central	10	18	19	23	18	16	14
America, South	5	8	11	10	7	7	8
Asia	5	10	19	19	21	14	29
Europe	23	20	17	24	22	20	29
Oceania	4	8	6	10	12	13	9

2.1.3. Global coverage of the 2000 WCA (1996-2005), is depicted geographically in Map 1. The shaded area of the map also covers the 8 countries for which the data was not available but were it was reported that the country undertook an agricultural census during the 2000 WCA.

2.1.4 A record number of 122 countries covered in the 2000 WCA also includes 8 that undertook their first agricultural census during the decade. These include China, Comoros, Kyrgyzstan, Lao People's Democratic Republic and Mozambique. The censuses of agriculture of Croatia, Czech Republic, Estonia, Latvia, Lithuania, Serbia and Slovakia were the first as independent countries.

2 For statistical purposes both "countries" and "territories" are hereinafter referred to as "countries".

3 Figures for Serbia reported here are extracted from a booklet on Census of Population, Households and Dwellings 2002. As per Communication number 295 dated December 24, 2002, the results relate to Central Serbia and AP Vojvodina.

CHAPTER 2. Participation of Countries in the 2000 WCA Round

2.1.5 The success of this round as compared to the previous 1990 WCA round is also due to the fact that about 41 countries which had undertaken a census before but missed the 1990 WCA round for a variety of reasons, did undertake a census in the 2000 WCA round. There were some 15 such countries in Asia and 12 in Africa.

2.1.6. An in-depth study of Table 1.2 of PART TWO shows that there are some 73 countries which carried out an agricultural census during both the 1990 WCA and the 2000 WCA rounds. This number includes 21 countries in Europe, 14 in Asia, 13 in Africa, 17 in North, Central and South America, and 8 countries in Oceania. It seems that a mandatory requirement of EUROSTAT is to conduct a Farm Structure Survey and/or Census, which is also linked to some incentives for the member countries. This has contributed to the establishment of a regular periodicity of agricultural censuses in Europe. Despite the absence of any such incentives, a tendency towards a regular agricultural census among Asian countries, particularly those occupying large agricultural areas, is also noted. Map 2 indicates the importance of agriculture in a country using the indicator "area of agricultural holdings as percentage of total area of the country"; see Column 8 of Table 1.3 in PART TWO for information on individual countries. It is encouraging to note that most major agricultural countries of the world are covered by this round of the WCA.

2.2 Coverage of the 2000 WCA round by population and area

2.2.1 Table 1.3 in PART TWO provides information on the geographical area of countries, the area managed by agricultural holdings, and the population for the 114 countries covered in this report. These results are summarized in Table 2 below to assess the global coverage of the 2000 WCA round, and depicted in Chart 1.

Table 2. Global coverage of the 2000 WCA round

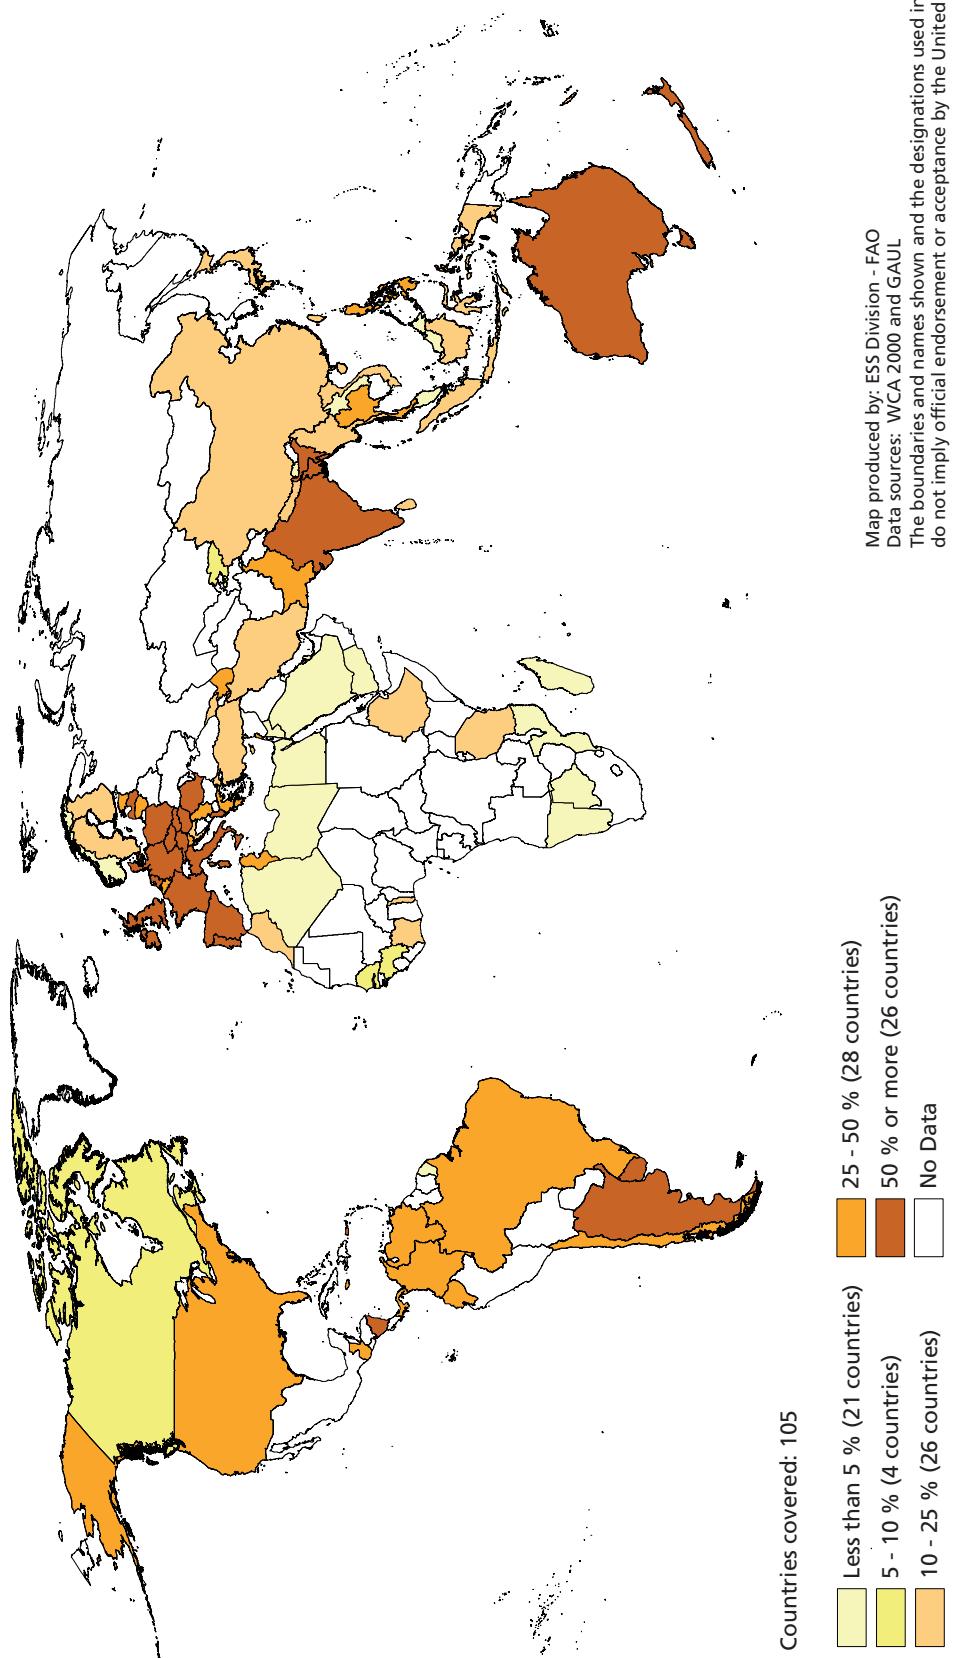

Region	World			Coverage of the 2000 WCA by					
	Total number of countries#	Total population (millions)	Total area of countries (million ha)	Countries		Population (millions) (% of world)		Physical area (million ha) (% of world)	
TOTAL	222	6 115	13 407	114	51.3	5 067	82.9	8 598	64.1
Africa	56	819	3 014	25	44.6	413	50.4	1 461	48.5
America, North and Central	36	484	2 284	14	38.9	344	71.1	1 859	82.7
America, South	14	356	1 782	8	57.1	307	86.2	1 440	80.8
Asia	51	3 698	3 176	29	56.9	3 484	94.2	2 585	81.4
Europe	39	727	2 297	29	74.4	496	68.2	456	19.8
Oceania	26	31	854	9	34.6	24	76.8	797	93.3

Source: Population (refers to year 2000-01) (FAO,2006);Total area of the countries (FAO, 1997).

#The number of countries has been kept the same as those in the 1990 WCA round to facilitate comparison. This minor inaccuracy is not likely to affect the broad conclusions.

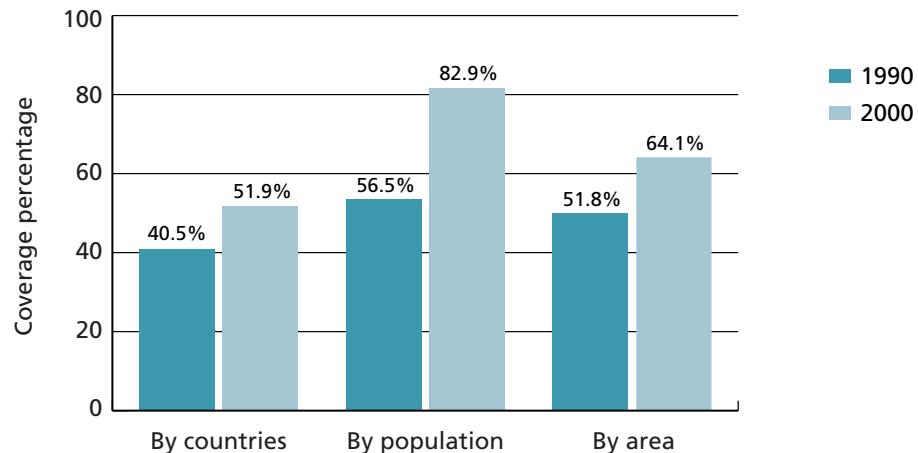

2.2.2 The size, population and structure of agriculture in the 114 countries covered in the report differ considerably. The report includes small countries like American Samoa with a country area of 20 thousand hectares to big countries like China with 932.7 million hectares. The total population of countries vary from 20 thousand inhabitants in Cook Islands to over 1,282 million in China. Together these 114 countries represent more than half of the total number of countries, and about 65 percent of the total geographical area in the world. The highest coverage of countries is observed in Europe which is followed by South America and Asia. The participation rate of countries in Africa, Central America and Oceania is among the lowest. Nonetheless, in Oceania, the area covered by agricultural censuses was over 93 percent, which was even better than the area coverage of about 81 percent in the Americas and Asia.

Map 2.
Area of agricultural holdings as percentage of total country area

CHAPTER 2. Participation of Countries in the 2000 WCA Round

Chart 1. Coverage of agricultural censuses in the 1990 and 2000 WCA rounds

2.2.3 Chart 1 and Table 3 present a broad picture of coverage during the 2000 WCA round as compared to the previous round. The remarkable success of the 2000 WCA round is demonstrated by the number of countries covered, the world area covered (area of the countries which conducted a census) and the population covered (population of countries which have done the census). In 1990 WCA round only 40 percent of the total countries were covered and 50 percent in 2000 WCA round. The population of countries conducting an agricultural census during the 2000 WCA round was about 83 percent of the world population as compared to the corresponding figure of only 56.5 percent in the 1990 WCA round. In terms of area, the 2000 WCA round covered 65 percent of the world area against about 52 percent covered in the 1990 WCA. The low rates of area coverage for Europe is largely on account of absence of Russian Federation and other neighbouring countries in both the 1990 and 2000 rounds.

2.2.4 The entry of China in the list of countries undertaking a census explains a large part of the observed increase in area and population covered by agricultural censuses. The first ever census of China during this round (1997) implied the inclusion of 130 million hectares of holding land in international comparisons. Also without considering China the increase would have been 39 percent in terms of area (from 5.6 thousand million hectares in 1990 to 7.8 thousand million hectares in 2000) and of 56 percent in terms of population (from 2.4 thousand million people in 1990 to 3.8 thousand million people in 2000). The large increase in area covered is due to the increased coverage in Asia (mainly due to China), North, Central and South America.

Table 3. Comparison of coverage in the 1990 and the 2000 WCA rounds

Region	By country				By population				By physical area			
	1990	2000	1990	2000	1990	2000	1990	2000	1990	2000	1990	2000

CHAPTER 3

Methodological Considerations and Limitations

3.1 Scope and coverage of the report

3.1.1 The items proposed to the countries for inclusion in their agricultural census as part of the Programme for the World Census of Agriculture 2000 and the related definitions and concepts can be found in Chapter 5 of the Programme document (FAO, 1995). The metadata on agricultural censuses of individual countries and the main results for the countries participating in the 2000 WCA round have been published (FAO, 2010). The publications and the related information can be downloaded from the website of the FAO Statistics Division which has a dedicated section on the WCA.

Incompleteness of the 2000 WCA round

3.1.2 This report on the 2000 WCA round relates to only 114 countries out of the 222 countries and territories in the World, of which 189 were FAO members at the end of the round⁴. The main countries (in terms of population) not covered in this round, by continent, are:

- **Africa:** Nigeria
- **North and Central America:** Dominican Republic, El Salvador, Haiti and Mexico
- **South America:** Peru
- **Asia:** Iraq, Israel and Syrian Arab Republic
- **Europe:** Belarus, Russian Federation and Ukraine
- **Oceania:** none.

3.1.3 This publication was conceived with the objective of providing comparable data on the key structural aspects of agriculture practiced in different countries around the world. The international comparison tables included in PART TWO includes data for all countries which have provided their reports to FAO. However, due to the varying scope and coverage of country censuses, it has not always been possible to cover all the reporting countries in all the tables. It was considered useful to prepare and publish specific tables even if only a few countries could be included in them. It can be noted from the 36 comparison tables included in this publication that the number of countries covered in a table varies from 15 in Table 10.1 on irrigation to 114 in Table 1.2 on number and area of holdings. The countries not covered in a table were either those whose reports were not available to FAO, or comparable data on the relevant item could not be found in their reports.

Caution in reading the tables

3.1.4 The information in the tables has been arranged by regions as described in Chapter 1. However, as not all countries in a region are covered in a table, *it has not been possible to come up with complete regional totals*. Also, the number of countries from a specific region covered in the tables varies, depending upon the availability of data on the theme of the table. Despite incomplete regional coverage, it may be possible to draw some meaningful conclusions from the tables included here. In many places the report provides regional totals or averages. These refer only to the countries included in the specific table. Averages in many places could be taken as representative of the countries in the region for comparing the situation with other regions. *Whenever using summary statistics (total or average) for a region the user is advised to see the corresponding list of countries covered in preparing such indicators.*

3.1.5 The report, despite its limitations, is not only a ready reference source for data from individual countries, but also enables users to draw valid cross-country conclusions such as: country A had the largest area under wheat around year 2000; country B raises about twice as many cattle than country C, etc. *It is*

⁴ The FAO member countries in 2011 were 194, including 2 associate members.

noted that for most important tables most of the important countries contributing influential figures have been covered by and large. But when affirming “country A had the largest area under wheat around year 2000”, the user should pay attention to the possibility that a big wheat producing country might not have reported census results to FAO (or has not taken any census at all). Since most of the largest countries in the world have reported census data in the 2000 round, it is likely that most of the time such affirmations would be correct. However, if this affirmation is intended to serve as the basis for important decisions, users should conduct a second investigation on possible missing countries and take the necessary effort to add complementary data to the table from alternative sources. Users are also advised to recheck the other possible limitations on data before making assertions based on the data presented in the publication. Some of the possible limitations in the data in this publication may render some logical assertions approximate, or even wrong.

3.2 Limitations of the data reported

3.2.1 No data is without limitations. Apart from those arising from scope and coverage of this publication, the users should also be aware of other limitations of the data presented in the publication. These limitations are very often rooted in the technical decisions taken at country level while selecting an appropriate and feasible methodology for the agricultural census. Such decisions and consequential limitations span over a variety of issues, including operational definition of agricultural holding used, geographical coverage of the census, deviation in concepts and definition (agricultural land, for instance), sampling error, imperfect sampling frame, non-sampling errors due to measurement in a specific unit and reclassification of data in another unit after a change in the unit. It is not the purpose of this publication to discuss at length these factors. The publication on Methodological Review of the 2000 WCA (FAO, 2013) will deal with such issues in detail. Nonetheless, keeping in view the need to make the data users aware of the implications of these limitations for comparability of the data, a brief review of the nature of limitations present in the census data is provided here with some examples of their existence.

Geographical coverage

3.2.2 Of practical consideration is the fact that some countries decide to exclude some parts of the country from their census investigation, e.g., urban and peri-urban areas, desert and semi-desert regions, remote areas with difficult access, disputed territories or area affected by civil disturbance. These conscious geographic exclusions in census taking are not uncommon. Some 20 countries out of 114 countries have adopted such practices. For instance, Mozambique had excluded some districts due to adverse natural events; in the case of Georgia uncontrolled territories in Abkazia and Tskhinvali regions excluded from the census. In Afghanistan and Guatemala some regions of the country were excluded for security reasons. Other countries like Saint Lucia and Sri Lanka excluded commercial areas. Non-agricultural zones were excluded in Argentina and India. Chile, whilst covering the whole country, excluded some regions for collecting particular agricultural information.

The most common type of exclusion relate to “urban and peri-urban area”. Due to evolutionary changes in the structure of agriculture, backyard gardens⁵ or poultry raising in these areas may become important in some countries, and ignoring theses activities or these regions as a matter of convention might result in under coverage of the census. The details of exclusions made by individual countries are given in Table 1.1 of PART TWO.

Exclusion of some holdings

Exclusions are also made on the basis of holding characteristics. A review of census coverage by holding types indicated common use of basically three types of restricting criteria and their possible combinations, viz., a) exclusions based on minimum size of holding; b) exclusions by legal status of holding, and c) exclusions based on type and purpose of production on holding. Table 1.1 presents the exclusion criteria used in the countries covered in the report. The table shows that 72 out of 114 countries used some kind of criteria to restrict the definition of an agricultural holding for coverage in the census; 25 countries used a combination of minimum size of land and livestock, 23 of them used a more complex combination (for instance land,

⁵ EUROSTAT guidelines recommend countries to include area under Kitchen gardens under Utilized Agricultural Area.

livestock but also minimum value of sales during census year), and the others used only one of these criteria e.g. land, livestock or value of sale.

Some exclusion of agricultural holdings from the purview of agricultural census was also noted on the basis of their legal status. For example, Cook Islands excluded all lands operated by institutions, communities and government. Iran did not cover the modern poultry farms. Serbia excluded agricultural enterprises and co-operatives, perhaps because the data on agriculture were collected during the Census of Population only from the holdings managed by households. In Uganda, the private large scale and the institutional farm sector was not investigated. In these cases it is not clear whether the data from the excluded section is included in the reported figures or not. These exclusions of special types of holdings need complementary data from alternative sources to complete the picture of the agriculture sector. One such important source could be an economic census, which also covers how enterprises engage in agriculture.

The most common type of exclusion practiced in the censuses are based on the size of the productive assets of the holding or scale of operation. Some thresholds linked to land size and/or livestock heard size are established, and the agricultural activities on the holdings below the threshold are not enumerated in the agricultural census.

Table 4. Geographical exclusions and use of thresholds

Countries by region	Number of countries	Number of countries with geographical exclusions	Number of countries using thresholds
1	2	3	4
WORLD	114	20	72
Africa	25	6	7
America north and Central	14	1	11
America, South	8	3	7
Asia	29	9	16
Europe	29	1	24
Oceania	9	0	7

Note: Based on Table 1.1 in PART TWO

Operational modifications to definition of agricultural holding

3.2.3 The 2000 WCA Programme defines an agricultural holding as:

"An agricultural holding is an economic unit of agricultural production under single management comprising all livestock kept and all land used wholly or partly for agricultural production purposes, without regard to title, legal form, or size. Single management may be exercised by an individual or a household, jointly by two or more individuals or household, by a clan or tribe, or by a juridical person such as a corporation or a government agency. The holding's land may consist of one or more parcels, located in one or more separate areas or in one or more territorial or administrative divisions, providing the parcels share the same production means utilized by the holding, such as labour, farm building, machinery or drought animals."

This is the theoretical definition of an agricultural holding. For the purpose of keeping the workload of censuses and surveys to a manageable limit, an operational definition of the survey unit is needed. This operational definition of an agricultural holding of the survey unit is often decided on the basis of holding characteristics to capture the contribution of units which are engaged in agriculture at a significant scale. The level of significance is determined by establishing a threshold. Over 60 percent of the countries covered in this report established some type of threshold for coverage of holdings in the census. This practice is more common in the Americas and Europe. About 50 percent of countries in Asia also use it. Incidentally, only 7 out of 25 census reports received from Africa report use of thresholds.

The thresholds for an agricultural holding to be covered in the census are usually established by means of criteria: i) minimum area dedicated to agriculture, like in Uruguay; ii) a combination of minimum in area, livestock and number of trees, like in the Caribbean countries (Jamaica, Saint Lucia, Saint Kitts and Nevis, Saint Vincent and the Grenadines, Trinidad and Tobago) or Cyprus, Chile, Iran Islamic Republic of, Jordan, Lao People's Democratic Republic, Lebanon; iii) minimum amount of sales or value of output, as in United

States of America, Puerto Rico, Virgin Islands (USA), Guam, almost all European countries and Australia, and iv) a combination of some of the above mentioned criteria like in Republic of Korea and Vietnam. The thresholds used in individual countries is presented in Table 1.1 in PART TWO.

In Europe, the common thresholds are established by EUROSTAT definitions and EC legislation⁶. The Table 5 presents the EU regulation on the thresholds. The regulation requires that all units reaching at least one of the threshold criteria should be covered. It also suggests that in the case that countries modify this definition they have to ensure that no more than 2 percent of agricultural output is left out from the census coverage. Considering the total contribution of holdings below the threshold, countries like Spain and Italy have adopted a lower threshold for coverage of holdings in the census. This while ensuring complete coverage of the agriculture sector of the country, provides facility to produce data comparable with other EU countries. Having covered a broader set of holdings one could always generate estimates for holdings operating at different scales.

Table 5. EUROSTAT thresholds for the farm structure surveys and the survey on agricultural production methods

	Characteristics	Threshold
Utilized agricultural area	Arable land, kitchen gardens, permanent meadow and pasture, permanent crops	5 ha
Permanent outdoor crops	Fruit, berry, citrus and olive plantations, vineyards and nurseries	1 ha
	Fresh vegetables, melons, strawberries, which are outdoors or under low (not accessible) protective cover	0.5 ha
Other intensive production	Tobacco	0.5 ha
	Hops	0.5 ha
	Cotton	0.5 ha
Crops under glass or other (accessible) protective cover	Fresh vegetables, melons, strawberries	0.1 ha
	Flowers and ornamental plants (excluding nurseries)	0.1 ha
Bovine animals	All	10 heads
Pigs	All	50 heads
	Breeding sows	10 heads
Sheep	All	20 heads
Goats	All	20 heads
Poultry	All	1 000 heads

3.2.4 Excluding some types of holdings from the census coverage, whatever is the chosen exclusion process, leads obviously to an underestimation of the agricultural activity and related production in the country. But if for example, country A did not proceed with exactly the same exclusion process as country B, underestimation may not be of the same order of magnitude, rendering, therefore, the figures slightly incomparable. However, it is expected that when deciding the exclusion criteria, countries are vigilant to keep these underestimations to a minimum level, perhaps of the same order of magnitude as observation errors⁷. For instance, Denmark excluded from the 1999 census farms with less than 5 hectares of agricultural area or less than a specified economic size (4000 euros of Standard Gross Margin); though the holdings below the threshold are about 8 percent of total holdings, their contribution to the agricultural production is estimated to be less than 0.5 percent. In such case, complete enumeration would have lead to a waste of resource. *One negative aspect of varying thresholds in different countries is that indicators such as "average size of holding" compiled on the basis of census data are not strictly comparable as they are not based on the information for the complete distribution of holding by size.*

⁶ 88/571/ECC Council Regulation, Article 5 and 6.

⁷ Observation error means any kind of factor, which results in reality not being correctly recorded at the end of the process.

A wrong declaration, a misunderstanding between holder and enumerator, a mistake in data processing etc. are possible instances of something which creates a difference between recorded value and the true value; these are typical observational errors in census and surveys.

In Denmark and in other EU Member States the decision of using a higher threshold was based on studies using data from previous agriculture censuses. The EU countries that adopted a particular threshold committed themselves to fixing the threshold at a level *excluding only the smallest holdings which all together contribute 1 percent or less to the total standard gross margin (SGM)* at country level, as per the Decision 85/377/EEC, applicable to each of the EU Member State concerned. This case is a good example of a prudent and conscious decision based on full knowledge of the complete distribution of scale of operations of agricultural holdings. Nevertheless, when adopting a specific threshold, at country level, it is recommended to analyse the previous data series to be sure that the population of holdings that are subject to the agricultural census will provide relevant information for an accurate estimation of the total agricultural production. In some countries the total contribution of tiny household holdings practicing homestead cultivation may be up to 30 percent of total output, particularly for items such as pigs and poultry. The information on these tiny subsistence holdings may be important for handling food security and livelihood related issues.

Imperfect frame

3.2.5 The enumeration of agricultural holdings is normally based upon a list of holdings or other similar instruments called "frame". If the frame is not accurate enough, or not recently updated, there may be omission or duplication in enumeration of holdings, resulting in inaccuracy in the results, rendering comparisons approximate. There is very little information on inaccuracy due to such imperfect frames in the national reports. Some countries like Nicaragua report extensively on coverage checking through a Post Enumeration Survey (PES) but it is not a common practice.

Complete versus sample enumeration

3.2.6 Due to various reasons, mainly budget constraints, not all countries are able to conduct their census through a complete enumeration of all agricultural holdings. It is then carried out on a sample basis involving collecting information from only a predetermined number of holdings, as legitimated in the Programme for the World Census of Agriculture 2000 (FAO, 1995. § 4.20). Results are then extrapolated from the sample enumeration to the complete population. Such extrapolations provide only the confidence intervals containing the true values, which are based on the estimates and the associated 'sampling error'. Therefore, users should keep in mind this additional margin of uncertainty when comparing figures derived on one hand from complete enumeration and, on the other hand, from expansion of sample results. The practice of reporting sampling error of estimates is not very common, particularly in developing countries.

3.2.7 About 11 countries carried out their census with sample enumeration in the 2000 WCA round, mostly African and Asian countries, while 13 countries carried out their census by combining complete enumeration with sampling, for instance for some specific crops. Readers will find more information on this in the Methodological Review (FAO, 2013).

Units used for measurement of area

3.2.8 Countries use their own units to express measurement of area, and it is not always hectares (ha). For instance China used mu (1 mu = 6.666 are), Guatemala used caballeria (1 caballeria = 0.4516 ha) and so on. Another related problem refers to the measure of size used for classification. It was observed that some countries did not classify data by size of total area, as suggested in the FAO Programme. Instead they used the size of agricultural land or cropland within holding as the classification variable. This makes the distribution of holdings by size class intervals in a strict sense incomparable. Readers should pay particular attention to footnotes in the tables on this point.

Incomparable classifications of holding-size and interpolation

3.2.9 The Programme for the World Census of Agriculture 2000 recommended that countries reported results with detailed classifications (FAO, 1995. §6.19) of total operated area of holdings so that the international data could be presented in comparable land size classes, and full distribution of holdings by size classes was known. Table 1.4 of this publication uses the FAO recommended classification for land size of the holding, viz.

- Under 1 ha.
- 1 and under 2 ha.
- 2 and under 5 ha.

- 5 and under 10 ha.
- 10 and under 20 ha.
- 20 and under 50 ha.
- 50 and under 100 ha.
- 100 and under 200 ha.
- 200 and under 500 ha.
- 500 and under 1000 ha.
- 1000 ha and over.

3.2.10 Unfortunately not all countries have supplied data in these size class intervals and a few national reports used national classifications to suit their requirements, not conforming to FAO recommendations. Some countries have used classifications which are apparently similar to FAO classification but differ in the use of units, e.g. 1 – 2 acres is not the same as 1 – 2 ha. When the former is converted to hectares for international comparison it becomes 0.404 – 0.809 ha. This class does not correspond to any of the FAO recommended classes, thus posing difficulties in comparison and creating room for interpolation. Such a problem was noted in some 30 out of 114 countries covered by the report. For example, Guatemala and all US territories used acres, while Nicaragua uses Manzanas, for reporting the land distribution of holdings. About 15 other countries used hectares as the measurement unit but did not present results in the recommended classification, although some size class interval may match. In this case interpolation was limited to a part of the complete distribution only. For instance, Morocco and Cote d'Ivoire presented results for classes 0 to 1 ha, 1 to 3 ha and 3 to 5 ha, etc. Therefore, figures had to be interpolated for the classes 1 to 2 and 2 to 5.

Interpolation method

3.2.11 The interpolation method used for standardizing the land size classes is based on the empirical fact that, usually, the distribution of holdings by size follows a log-normal pattern⁸. The number and area of holdings in the new classes is therefore estimated by a linear interpolation on a probity scale. See Table 1.4 for results. The table presents the interpolated results in bold. Users should note that these interpolated figures are not official figures (not available in official national reports, if any), and that, moreover, they probably encompass a certain margin of error due to interpolation, which makes any comparison further fragile. In all cases the particular situation of countries is presented as footnotes to the tables to facilitate their interpretation. The users are advised to refer to national methodologies for further details. (FAO, 2010)

3.2.12 The interpolation procedure for presenting data in FAO classes was not used in the case of open-ended intervals, such as "less than 5" or "more than 50" because the reliability of such estimates would be difficult to check. This affects vertical totals, because the figure available for the interval such as "more than 50" is added as if it were intended for the interval "50 and less than 100". The figures in shaded cell refer to size classes represented by the continuum of shaded cells.

3.3 Comparison with other data sources

3.3.1 One of the purposes of an agriculture census is to establish benchmark data which is used to correct data from sample surveys. Users may thus be tempted to compare census figures with the figures derived from other national and international sources like FAOSTAT and AQUASTAT. This is often recommended in order to validate the quality of the data from a specific source. However, it is to be noted that the census

⁸ From the analysis of the data on number and area of holdings for about 70 countries participating in the 1970 WCA, it was concluded that "The lognormal hypothesis appear to be satisfactory for the distribution of number of holdings, and of area of holdings, for African countries"; "The results for countries in North and Central America generally appear consistent with the log-normal hypothesis"; there is no general conclusion for South America; "The distribution of holdings of Asian countries is generally close to the lognormal distribution"; "Some European countries use practices in tabulating data which yield results unsatisfactory for the application of the lognormal law. When the criterion for classification used and the type of area reported are the same, the distribution of agricultural holdings is close to lognormal for most European countries" and finally: "The difference in size of holdings among countries in the Southwest Pacific renders classification of these countries difficult". (FAO, 1984, page 13).

data may slightly differ from the data from alternative sources, though looking similar. This is mainly on account of conceptual and definitional differences of the data or differences in the methodology used for collection. The data in international data bases, though sourced from the same country, may come from diverse data sources such as administrative records, annual surveys or ad hoc assessment.

Table 6. Information on irrigation in agricultural censuses, FAOSTAT and AQUASTAT

Countries	Census Year	Agriculture Censuses			FAOSTAT	AQUASTAT
		Total number of holdings (units)	Total area of holdings (ha)	Holding area receiving irrigation (ha)	Agricultural area irrigated (ha)	Area irrigated (ha)
Egypt	1999-2000	4 541 884	3 750 699	2 879 566	N.A.	3 422 178
Tanzania	2002-2003	4 901 837	11 997 071	168 430	N.A.	184 330

Saudi Arabia	1999	242 267	4 046 446	1 191 351	N.A.	1 730 767
Turkey	2001	3 076 649	18 434 822	3 505 749	5 215 000	4 185 910

N.A: not available on FAOSTAT/AQUASTAT

3.3.2 Table 6 presents the data on irrigation (area irrigated) for 10 countries from three sources viz, agriculture censuses, FAOSTAT and AQUASTAT for the census year of the country. It can be seen that except for Nepal, which probably has reported FAOSTAT and AQUASTAT on the basis of census results, none of the countries has similar figures for the same data item, though by and large differences may not be unbearable for most countries. Most of the differences are rooted in the conceptual approach and the observing method. In the census, the question normally refers to the physical area, which was irrigated during the enumeration period (strongly linked to the weather during agricultural period). AQUASTAT instead refers to the area equipped for irrigation (therefore greater than census results except, surprisingly, in Philippines), whilst FAOSTAT may refer to the area potentially irrigable. See Table 10.1, PART TWO, based on agricultural censuses.

3.3.3 One further point of interest, it may be interesting to attempt a comparison of figures from, for example, an agricultural census and some other survey. In the Seychelles an agricultural survey (substitute of agricultural census) was carried out in 1998. A comparison of results from this survey with the figures derived from the 2002 Population and Housing census, led to a conclusion that the 1998 frame was probably incomplete and the survey did not carry out an exhaustive enumeration (301 holdings were enumerated in the survey whilst the population census showed, four years later, that at least 4685 households were engaged in some agricultural activities). Therefore, the results for the Seychelles in this publication are taken from the 2002 population census rather than the 1998 agricultural survey. Such difference in numbers may be due to differences in the definition of agricultural holdings in the two surveys.

3.3.4 Users are thus advised to take particular care in comparing figures with other sources, and the potential effects of difference in concepts, definitions and observing methods on the data.

CHAPTER 4

Main Findings

4.1 Scope of tables

4.1.1 PART TWO of this publication provides a series of 36 tables prepared with data extracted from national reports on agricultural censuses. Tables were prepared to provide a meaningful comparison with as much data as possible. An effort was made to include in the comparisons all the data conforming to the concepts and definitions recommended by FAO. However, in some cases, as explained earlier in Chapter 3, some approximations were needed. Footnotes are given in the tables, where necessary, to inform the users about approximations and variations in the concepts,. Relevant concepts and definitions are given at the end of the publication to clarify any vagueness in the table headings which have been deliberately kept short for aesthetic reasons. Some non-standard indicators have been calculated and included in the tables for drawing conclusions. These have been clarified in the tables by indicating the formula used for their calculation. In case of doubt relating to data for any specific country, the user should refer to the national concepts and definitions followed for collecting and presenting the data, available in the national reports. The tables in the second part of the publication cover most of the conventional themes of agricultural censuses. An attempt has also been made to provide numbers by broad categories, particularly for crop groups, e.g., cereals, pulses, oilseeds, sugar crops, and livestock species groups.

4.2 Highlights from the tables

4.2.1 From a rapid analysis of the tables to make a cross country comparison, it was possible to highlight the following main structural characteristics of agriculture worldwide.

Trend in number and area of holdings

Table 1.2 presents the number and area of agricultural holdings as available from agricultural censuses since the 1930 WCA round, which could be used to observe broad global, regional and national tendencies. While making comparisons over time and across countries, users should pay particular attention to the changes in the political boundaries, and methodologies, concepts and definitions used for the censuses. Information on this has been added as notes and footnotes to the table.

The structure of agriculture across regions and countries varies considerably on account of differences in topography, natural resources, climate and agricultural practices, as well as the diversity of human activities, availability of infrastructure and socio-cultural factors. Poor availability of comparable data at international level impedes the objective of tracking changes over time in different regions. There were only 66 countries that carried out an agricultural census in both the 1990 and 2000 WCA rounds, out of which only 61 reported both total number of holdings and total area of holdings. Table 7 provides totals for these 61 countries by regions.

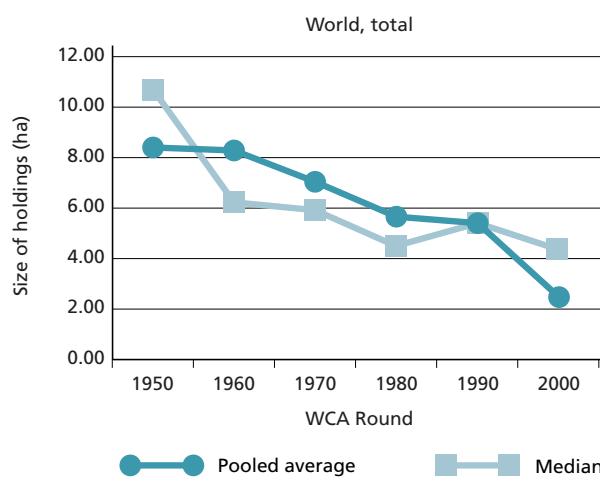

Table 7. Number and area for holding in the 1990 and 2000 WCA rounds

Region	WCA 1990		WCA 2000	
	Holdings (million)	Area (million ha)	Holdings (million)	Area (million ha)
1	2	3	4	5
Total world [61]				
Africa [9]	14	23	21	31
North and Central America [10]	3	462	3	450
South America [5]	8	605	7	593
Asia [12]	168	289	190	287
Europe [17]	14	206	11	182
Oceania [8]	0.2	484	0.2	472

If the countries covered in the regions are taken as a representative sample of their regions, it emerges that there has been an expansion of agriculture in Africa as the total area of the holding shows an increase of about 50 percent which is accompanied by similar increase in number of holdings. On the other hand a considerable fall in operated area of the holdings (about 12 percent) is witnessed in Europe. In Asia, while the area managed by the holdings has not changed much, there has been an increase of over 12 percent in number of holdings.

Map 3 shows average area per holding as obtained from the 2000 WCA round. Table 1.7 gives the average land size of the holding since the 1930 WCA round. In order to observe broad regional trends, both the pooled averages and the medians of national averages have been calculated. It is clear that during the last 50 years the median size of holding land in the world has become one quarter, from over 15 hectares in the fifties to about 4 hectares observed during the 2000 round (Chart 2). Furthermore, it is undoubtedly clear that while in Asia the holdings are becoming fragmented, a consolidation of holdings is taking place in Europe. This is evidenced by the fact that during the last five decades the average size in Asia has fallen from about 2.5 hectares to nearly one hectare, whereas in Europe it has grown from about 10 to 15 hectares. The increase in the size of holdings in Europe is perhaps a result of the drop in the number of holdings, which can be linked to structural changes arising out of technological developments in the agricultural sector, as well as the disappearance of smaller holdings due to the ageing of the holders. In Africa, the holding size declined during the sixties, seventies and eighties, perhaps due to redistribution of land in the newly emerging countries. A reverse trend has been observed during the period covered by the 1990 and 2000 WCA rounds (1986-2005). In North and Central America, with the exception of United States and Canada, there is a general tendency of decline in the size of holdings. In South America, the leading meat producer countries like Argentina and Uruguay have big holdings and an increasing trend in the size of holdings. The general tendency in the region including in Mexico and Brazil, however, is towards a declining size of holding. In Oceania, both Australia and New Zealand have an increasing trend in size of holdings, whereas other islands of the region have shown some mixed trends, though the general tendency is towards fragmentation of land and smaller holdings.

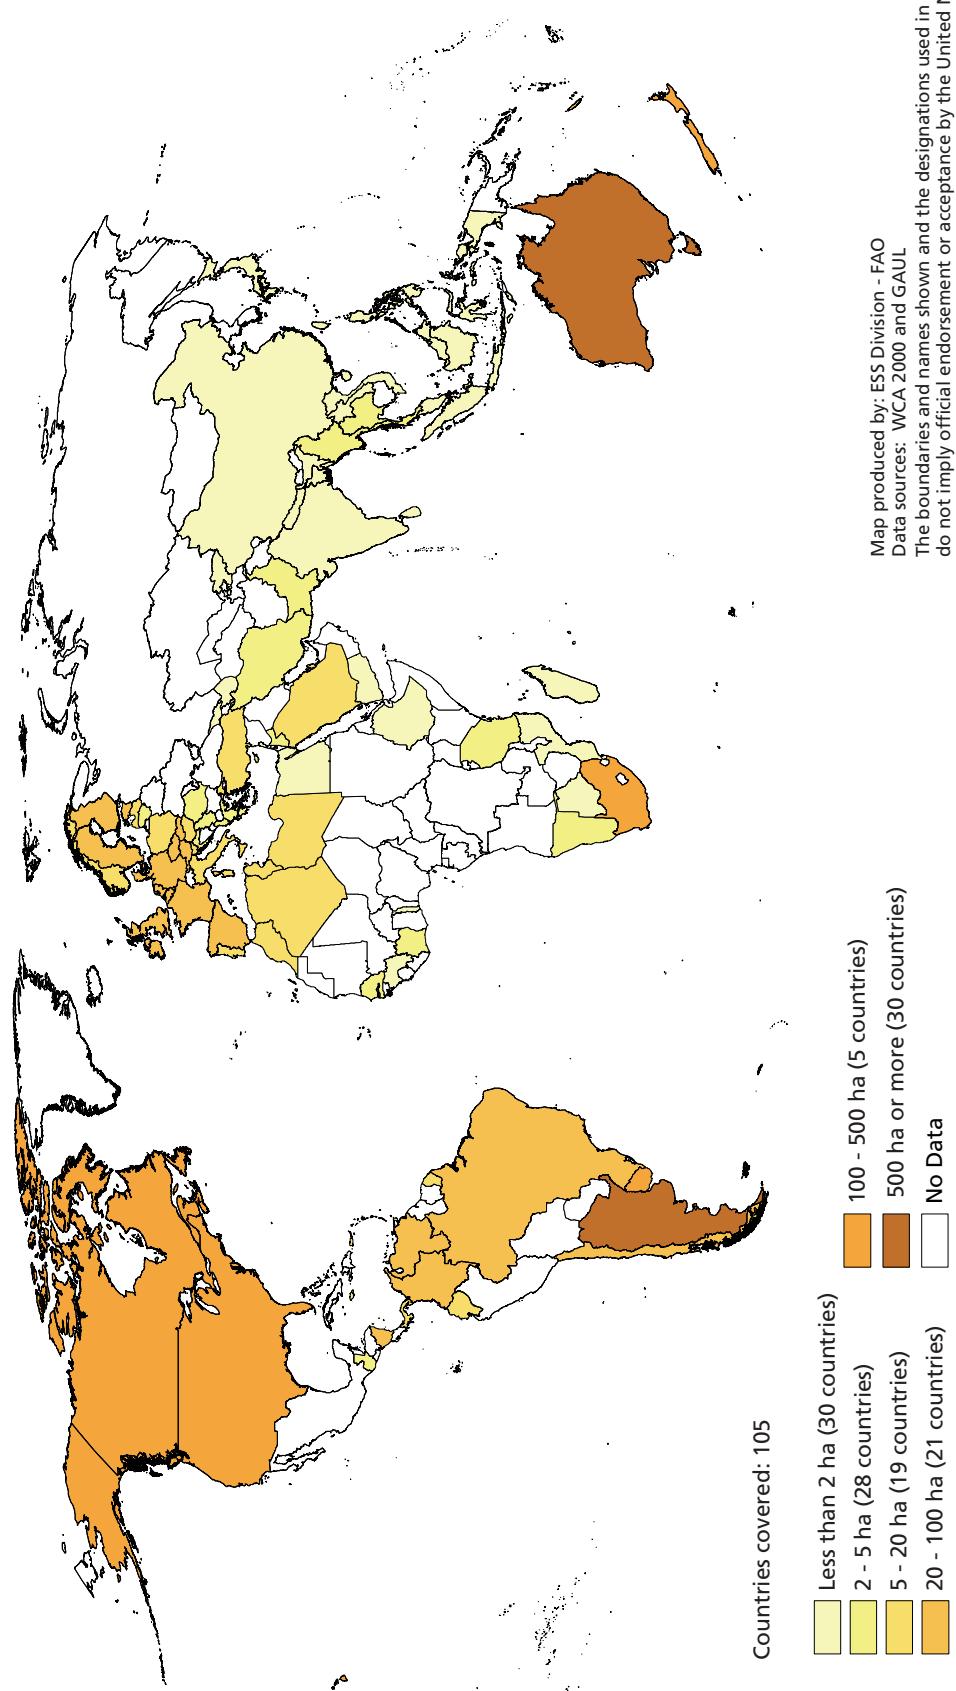

Chart 2. Global trend in average land size of holding

Distribution of land holding

4.2.2 Table 1.4 presents the number and area of the agricultural holdings in the reporting countries by size classes, and Table 1.6 gives the average land size of holdings and number of parcels per holding. These tables show a large diversity across the world in the average size of holdings and the distribution of holdings by size. For instance China has almost one hundred times more holdings than the US. But the total area of the Chinese holdings represents one third of the area of the US holdings. Thus the mean size of Chinese holdings is about 250 times lower than the mean size of the US holdings (0.67 ha against 178 ha). Also the mean size of Chinese holdings, as well as most of the Asian holdings, is about 5000 times smaller

Map 3.
Average area per holding (1996-2005)

than the average size of an Australian holding, which is an incredible 3243 ha, certainly due to prevalence of extensive livestock raising practices. Just to clarify the scenario further, not more than 10 percent of farms in China are bigger than 1 ha, but only about 10 percent of farms in the USA are smaller than 5 ha. This is also greatly reflected in the distribution of holdings by size: out of 193 million Chinese farms, 180 million farms are less than 1 ha, representing over 93 percent of the Chinese farms. Vietnam and Indonesia also have 85 percent and 75 percent farms respectively below 1 ha.

4.2.3 Seven countries that have a remarkably huge mean farm size are: Australia (3243 ha), Argentina (583 ha), South Africa (288 ha), Uruguay (287 ha), Canada (273 ha.), New Zealand (223 ha), and the US (178 ha). For all other countries the mean size never exceeds 100 ha. The situation is however really varied by continents:

- In Africa, except South Africa, the mean size of holding is generally equal to or less than 10 ha (10.45 in Libya and 10.24 in Tunisia represent the maximum). Some African countries notably have even very low mean size of holdings: Madagascar 0.86 ha, Egypt 0.83 ha, Cape Verde 1 ha, and 0.07 ha in Comoros; This may qualify just as backyard-gardening and not real agriculture if one considers Australian definitions of an agricultural holding.
- In North and Central America, very large holdings are found in the US and Canada. Nicaragua with over 31 ha as the average size represents maximum, among the remaining countries in the region.

Notes:

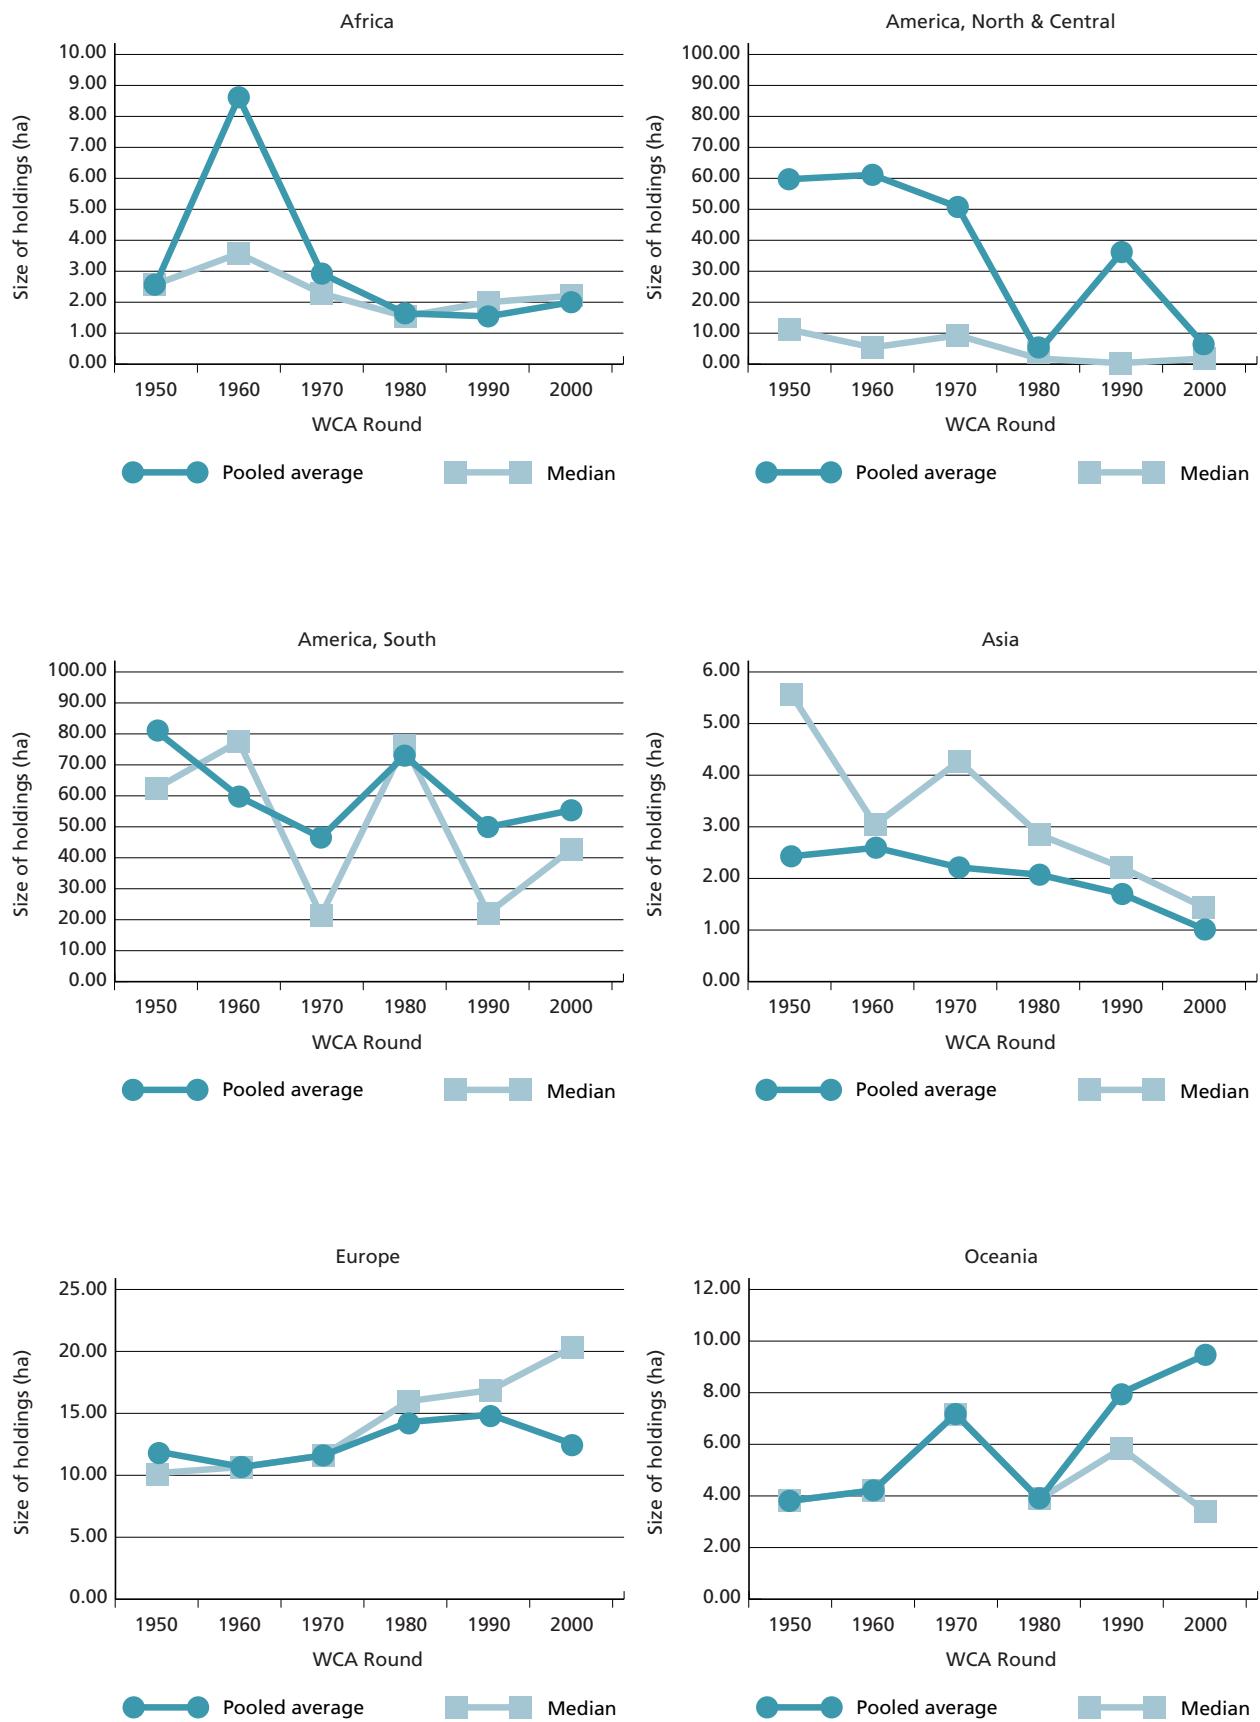

- These charts are based on Table 1.7
- In calculating the medians and pooled averages the outlier countries (Namibia, South Africa, Australia, New Zealand, Argentina, Uruguay, Canada, United States of America) have been excluded.
- For each WCA round the median reported here is the median of the average size of holding in all reporting countries.
- In South America, in addition to Argentina and Uruguay already mentioned, some other countries have also quite large holdings: Chile (83.74 ha) and Brazil (72.76 ha);
- In Asia, no country has an average holding size bigger than 5 ha, except some countries of the Near East: Saudi Arabia (16.70 ha) and Qatar (11.91 ha);
- In Europe no country average exceeds 100 ha, but a number of countries have quite large holdings, e.g. Czech Republic (99.28 ha), Sweden (93.87 ha), Finland (72.24 ha) and UK (70.86), and about 10 countries have a holding size between 10 and 50 ha;
- In Oceania, huge holdings are found in Australia and New Zealand, and very small holdings in all other islands, except New Caledonia (51.95 ha).

These marked differences make it obvious that any cross country comparison, by average or any other criteria, will need to consider the wide differences in the scale of operation of Australian or US farms on one hand and the Asian farm on the other.

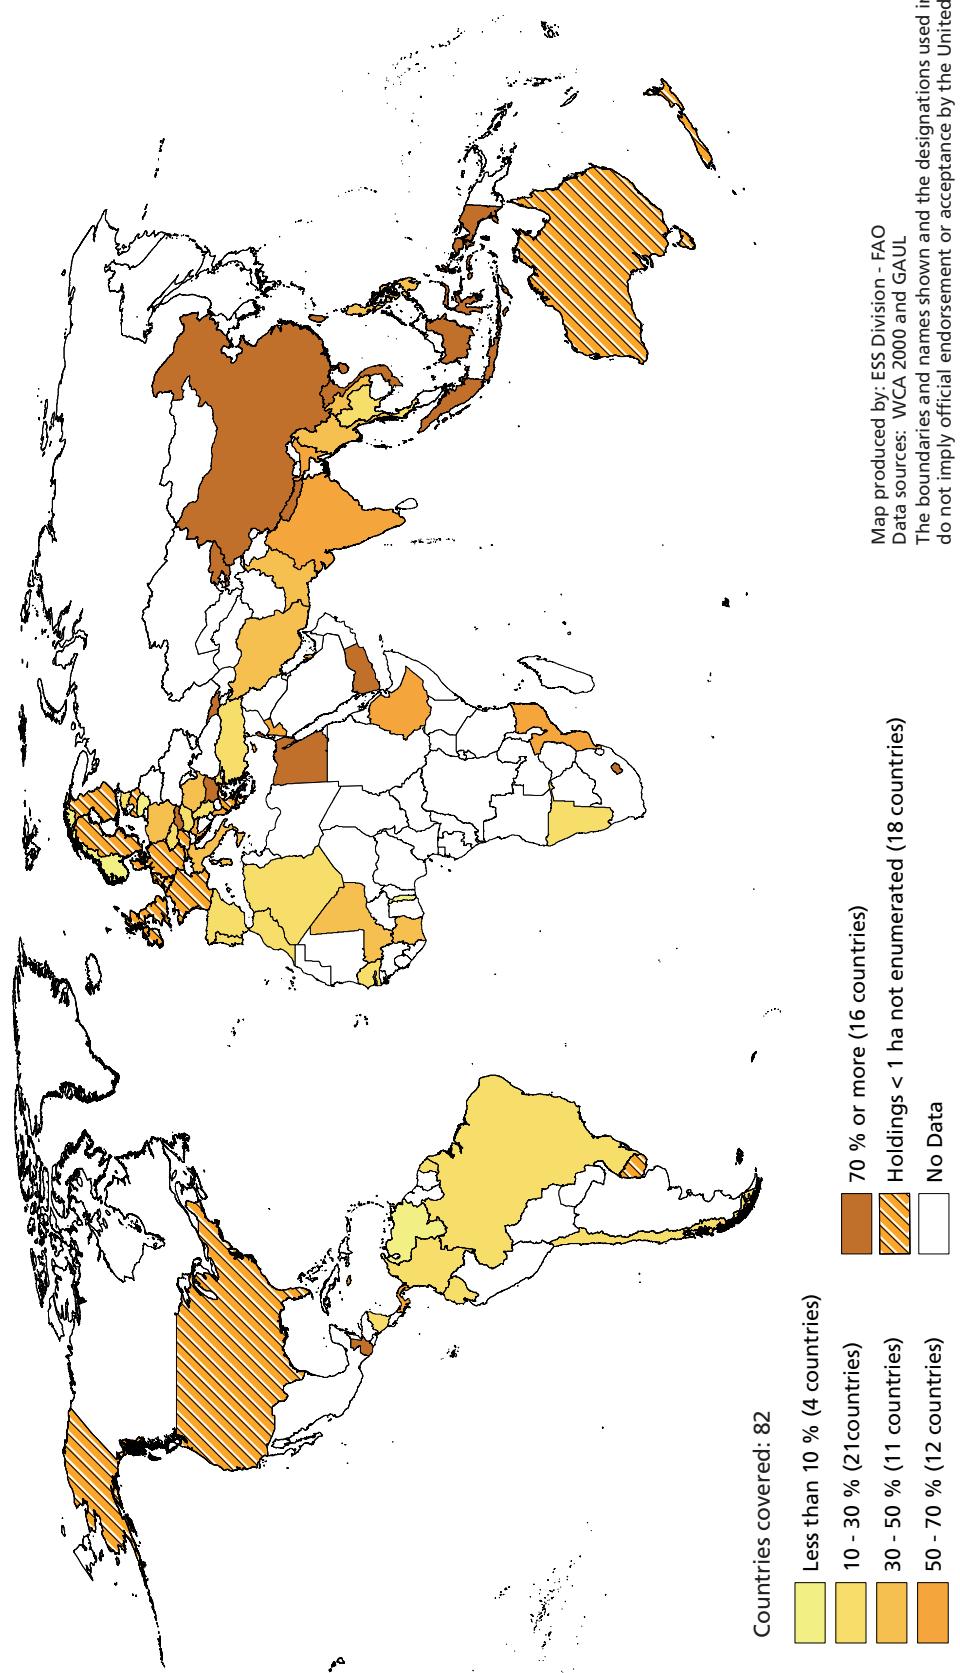

4.2.4 Map 4, prepared on the basis of Table 1.6, shows the proportion of small farms (with less than 1 ha of land). The highest proportion of these small farms is found in Asia and Pacific which is followed by West Africa. Australia, European countries and United States that do not enumerate small farms, perhaps because they do not exist or they do not contribute significantly to the agricultural output of the country. A study of 14 countries in Asia indicated that 77.2 percent of agricultural holdings were below 1 hectare and these accounted for 13.5 percent of the operated area. If we extend the limit to 2 hectares, over 88 percent of holdings accounting for nearly 30 percent of agricultural land is covered. In five Pacific countries, viz. American Samoa, Cook Island, Guam, Marina Island (north) and Samoa, 35 percent of holdings of 1 hectare and below manage only 5 percent of total area. Holdings below 2 hectares account for 64 percent of total holdings and operate only 18 percent of land. It is noted from the table that in Nepal, the agricultural holdings below 1 hectare operate about 40 percent of cultivated land in the country. In India, over 80 percent of holdings are under 2 ha and they account for nearly 40 percent of the area.

CHAPTER 4. Main Findings

Charts 3. Regional trends in average land size of holdings

Map 4.
Proportion of farms with less than 1 ha of land

There does not exist a commonly accepted definition of a small farm. For the purpose of international comparison, we arbitrarily divided the holdings into three size classes (0-5 ha), (5-50 ha) and above 50 ha. Table 8 indicates that globally over 94.3 percent of the holdings are of a size below 5 hectares, indicating the existence, to a large extent, of small subsistence or semi-subsistence family farms at world level. With 5 hectares as a ceiling for a small farm, in Asia 97 percent of farms are small, in Africa 91 percent and in Europe 72 percent. Farms below 5 hectares operate nearly sixty percent of land in Asia and nearly half the land in Africa. In Oceania, excluding Australia and New Zealand, farms below 5 hectares are operating 40 percent of the land. Farms over 50 hectares are found mostly in the Americas and in Oceania (Australia and New Zealand).

Table 8. Percentage of holdings in different size classes of operated area

Region	Total 1	Size classes of operated area		
		0 – 5 ha 2	5 – 50 ha 3	above 50 ha 4
World level [85]	100	94.3	5.0	0.7
Africa [14]	100	91.9	7.9	0.1
America, North and Central [10]	100	41.2	32.1	26.7
America, South [7]	100	43.9	40.6	15.5
Asia [19]	100	97.1	2.8	0.0
Europe [29]	100	72.5	23.4	4.0
Oceania [6]	100	34.6	29.5	35.9

Land fragmentation

4.2.5 Table 1.6 alone does not permit a general assessment of the trends in fragmentation or consolidation of land belonging to holdings, which could be gauged using the data from previous rounds. A snapshot of fragmentation of land managed by agricultural holdings during the 2000 WCA round is nonetheless possible. While globally the average number of parcels per holding between 2 to 3, the highest average number of parcels (over 10) is noted in Spain which is followed by Morocco with over 6 parcels on average per holding. Cyprus, Turkey, Serbia and Croatia, on average, have between 4 to 5 parcels per holding. African countries have in general less than 2 parcels on average per holding, with the exception of Uganda, Ethiopia and Morocco. In South America only two countries reported the number of parcels per holding: The Bolivarian Republic of Venezuela (about 1 parcel per holding) and Chile (1.6 parcels per holding). In Asia, with the exception of Jordan (1.2 parcels per holding), Cyprus (4.9 parcels per holding) and Turkey (4.0 parcels per holding), the reporting countries registered between 2 to 4 parcels per holding. European countries, with the exception of Spain, reported between 3 to 5 parcels on average per holding. The three reporting countries from Oceania had between 1 to 3 parcels on average per holding.

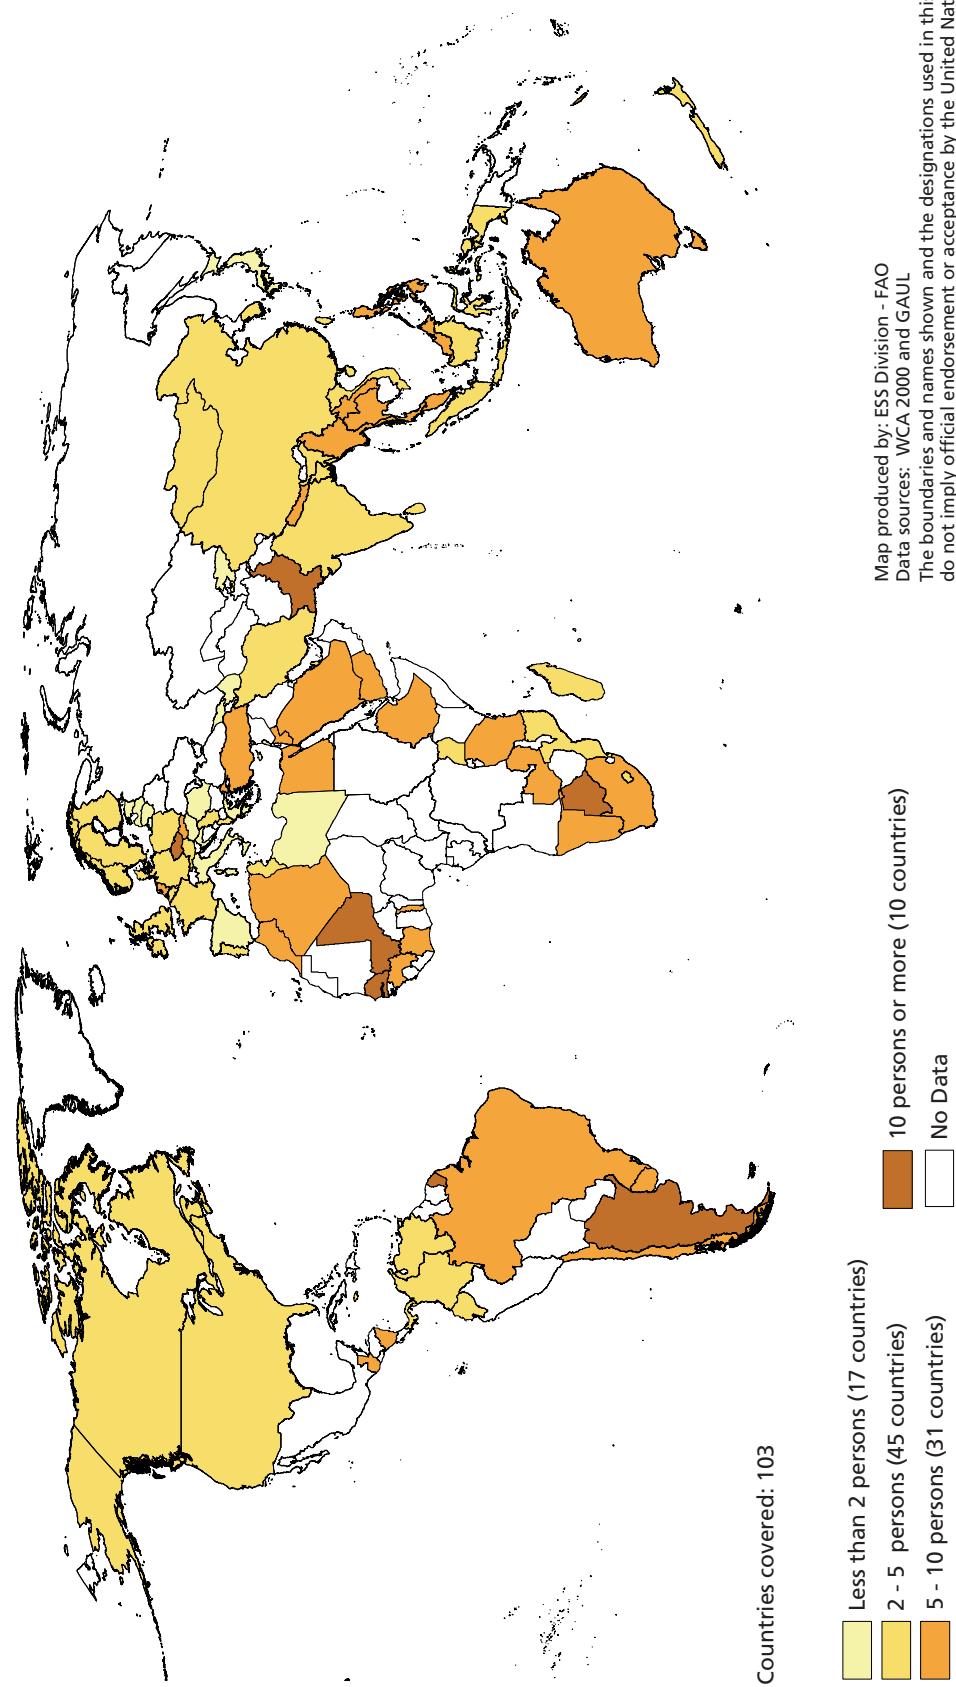

Importance of agriculture

Table 1.3 shows the share of area operated by agricultural holdings in total country area and the agricultural population per holding. At aggregate, agricultural holdings occupy nearly 30 percent of the total area of the 114 countries covered by the review, and each holding on average supports 4 to 5 members (map 5).

Agricultural population per holding is high in Africa, South America and Oceania. The average for Asia (4.4 persons per holding) is close to the global average, on the other hand, countries like Myanmar, Pakistan and Saudi Arabia have still high number of agricultural population per holding, perhaps due to joint family traditions.

A review of share of area operated by agricultural holding at regional and country level indicates the importance of agriculture in Europe, South America and Oceania. The United States, Bangladesh, and India also have large shares.

Map 5.
Agricultural population: persons per holding

Gender

4.2.6 Most agricultural holdings in the world are managed by males. In all continents, among the 56 countries which reported data by gender (see Table 2.1), the share of holdings managed by females out of total holdings, is generally less than a quarter. The situation in Europe is more equitable than in Asia and Africa. Whereas in Europe female headed holdings account for nearly 37 percent of holdings, in Asia and Africa only about 15 percent of holders are female. In Europe Romania in Europe and Cape Verde in Africa show a balanced situation. This situation is perhaps because men have migrated for better work opportunities. An in-depth analysis of the gender aspect of agriculture is presented in the *State of Food and Agriculture: Women in Agriculture* (FAO, 2011).

The gender of the agricultural holder may not be the most suitable indicator for measuring the contribution of holders in all situations. In Africa, due to tenurial arrangements and practices relating to the management of a family's productive assets, the sex of the holder is not a valid indicator for measuring contribution of women, particularly in regions where the land owned by the head of the household is allotted to female members of the family for their independent management. A concept of sub-holder has been used in these situations which reveals a much greater role for women in agriculture than is usually visible from tabulations based on the sex of the holder (FAO, 2005b).

Land tenure

4.2.7 Data on tenure of holdings according to the FAO classification, available from 22 countries, is presented in Table 3.1. Land owned by the holder or held in owner like possession represents the most common form of land tenure on the agricultural holding. In most of the countries, the land on over 50 percent of the holdings completely belong to this category.

More than half of the area on which data are available is declared in 'holdings operated under more than one form of tenure'. This might be related to the size of the farms: the greater they are, the more fragmented they may be and, therefore, many forms of tenure for the various parcels may be present there. Unfortunately, it was not possible to confirm this hypothesis as none of the countries with large farms reported data on fragmentation. The distribution of area of holding by tenure of land operated may be seen in Table 3.2.

Legal status of the holder

4.2.8 Only 57 countries reported data on this aspect. Investigation of this theme was recommended by FAO because of the economic importance of farms managed by juridical (public or private) persons: they may not be numerous in a country, but may occupy a large part of the national productive resources and employ many workers. Table 4.1 gives the break-down of the number and area of holdings managed by "civil persons" and "others (institutions)". The available data on form of management of holding seem to confirm the hypothesis that institutions, though few in number could manage large chunks of land. In most of the countries, farms managed by juridical persons are fewer than 10 percent. Only four countries have more than 10 percent of the farms managed by juridical persons: France 19.0 percent, Uruguay 13.7 percent, UK 11.9 percent and USA 10.3 percent. But they control quite a significant part in national economies: for instance in Uruguay these farms managed 38 percent of the total area, and in the USA about 34 percent of the total area of all holdings.

Demography and farm labour

4.2.9 Table 5.1 presents available information on demography of farm and source of farm labour. The general conclusion is that agriculture is no more a sector which absorbs labour from outside. Of the 75 countries reporting on employment, 57 reported using hired workers; 55 of them reported that there were, globally, less hired workers than holdings in their country. Only two countries had more workers than holdings: Puerto Rico with 1.8 workers per holding and the USA with 1.4. Globally the 250 million holdings in these 57 countries (including China)⁹ employed 22 million workers, which is less than 1 worker per

⁹ This set of countries represents 250 millions of holdings out of the 500 millions in the 114 countries having their census in the 2000 round, a quite significant sample to confirm the assertion.

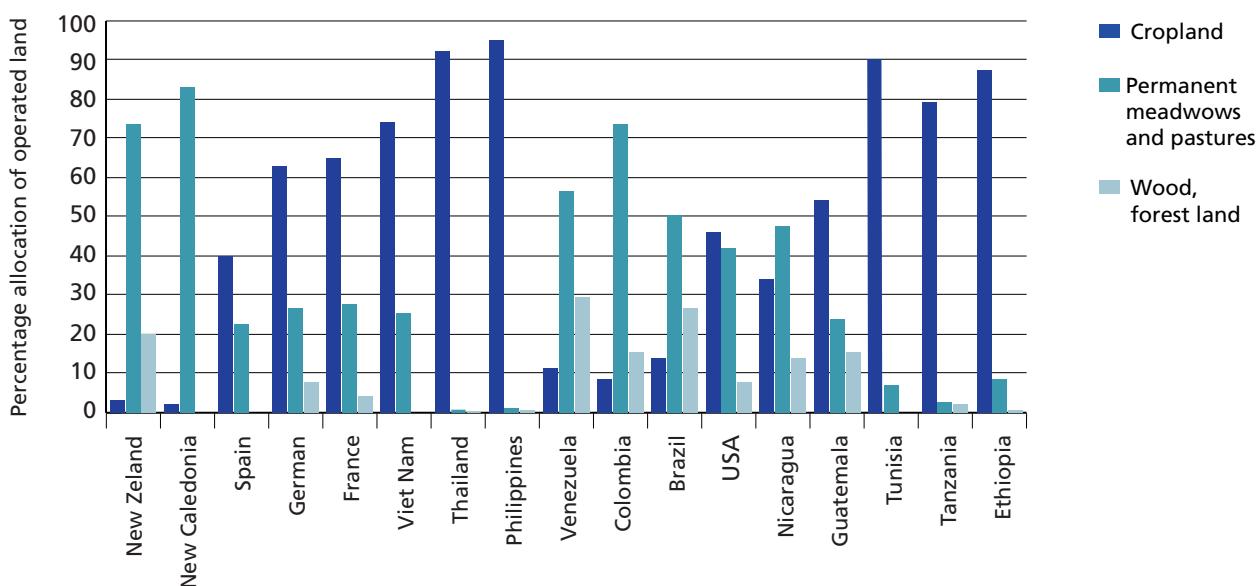

10 holdings. The hiring of workers for agricultural activity, except perhaps for some specific production process such as industrial crops, market gardening or to meet seasonal demand, does not seem to be a common practice in most countries.

Conversely, agricultural farms remain an important source of employment for household members of holders. In effect, of the 36 countries reporting on employment of household members, it appears that 232 million holdings employed 596 million members of households, that is, on an average 2.58 household members work on the agricultural holding. China reported that 519 million household members were engaged in agriculture on 193 million holdings having 800 million persons, that is, 2.7 agriculture workers in each household of 4 persons.

Land use and cropping intensity

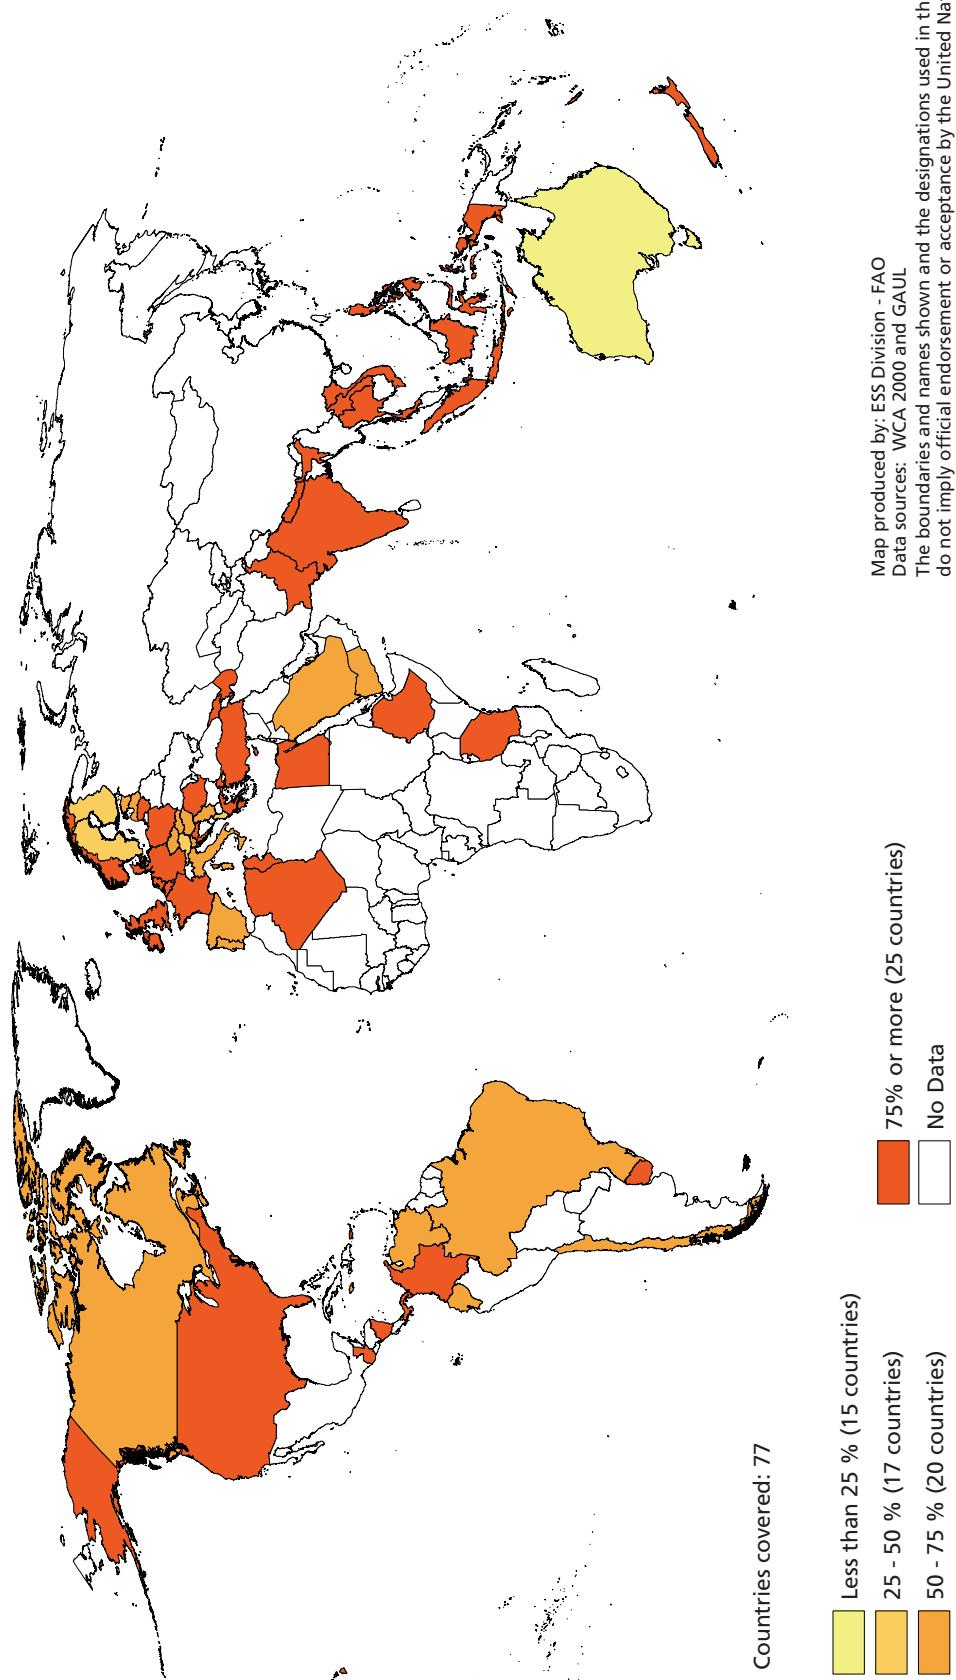

4.2.10 Chart 4 below prepared on the basis of data on a sample of large countries, extracted from Table 6.2, describe the features of main land use over continents. It presents some interesting feature and pattern. Map 6 based on table 6.1 presents the use of land for agriculture purposes in different countries.

Chart 4. Land use for crops, permanent meadows and pastures, and forests

- In **Asian and African countries**, cropland is the biggest part of the area of holding; in other words, in these countries holders tend to limit the activities on their holding to mainly crop cultivation. Since livestock are also present, meadows and pastures may be someone else's property, perhaps collective and/or public meadows which are not being counted in the agricultural census. Existence of nomadic livestock is not an uncommon feature in Asia, particularly central Asia, and Africa. Map 7 presents the global picture of share of cropland in the land operated by holdings.
- On the other hand, holdings in **America (North and South) and Oceania** generally encompass a great part of permanent meadows for their animals. They are also the ones keeping significant areas of woodland and forests on their holdings, perhaps in view of organising rotation with meadows. The share of cropland seems to be minimum in countries of South America, confirming that livestock keeping is the main agricultural activity in this region.
- **European countries** present a more balanced situation with between half and three quarters of the area of holding serving as cropland, about a quarter for meadows and less than 10% devoted to wood and forest.

Map 6.
Percentage of cropland in operated land

4.2.11 Due to limitations in data it is difficult to precisely calculate cropping intensity. Nonetheless, a rough and ready calculation presented in Table 6.3 indicates that the practice of intensive cultivation of land (viz. repeated cultivation during a year) is more common in Asia and Africa than in Europe and the Americas. This seems to be more a tropical phenomenon as the climate offers better opportunities. Egypt with a cropping intensity of over 200 percent indicates that most farmers take at least two crops a year. The other countries with high cropping intensity include Ethiopia, Jamaica, Myanmar, Nepal, Pakistan and the Philippines. Among the countries with high cropping intensity, Egypt, India, Pakistan and Nepal have dedicated large areas to food cultivation.

Crops

4.2.12 Of main crops, Asian countries reporting census results, cultivate nearly 90 percent of the global area under rice (India 44.2% and China 28.6%), nearly fifty percent of the area under wheat and forty percent of the area under maize. These ratios confirm the hypothesis that Asian countries tend to concentrate on the cropping of basic cereals, which are the mainstay of their diets. Globally speaking, more than half of the area under cereals is located in Asian countries. However, shares of production may be distributed differently over continents, because of differences in yields as well as in number of harvests per year (for rice for example). The scale of production of a commodity differs from country to country; the largest wheat growing farms are in the Americas: Canada (149 ha of wheat per holding), USA (109 ha.) and Uruguay (101 ha) whilst the same ratio in Asia is only 0.9 ha of wheat per holding in India (no figure available for China, but we can expect the same order of magnitude). Table 7.1 presents area under main cereals reported by countries.

Among the countries reporting area under leguminous crops India has the highest area. This is not surprising, as in a predominantly vegetarian country pulses are the main source of protein in daily diet. Other important growers of legumes are: Brazil, Canada, Myanmar, Ethiopia and Tanzania. Brazil and India are the leading growers of sugar crops, mostly sugarcane. The dominant sugar crop in Europe is sugar beet. The United States and India are the leading temporary oilseeds growers. Tanzania and Brazil have dedicated large areas to cultivation of roots and tubers. In Europe, every country is growing roots and tubers, mostly potatoes.

Livestock

4.2.13 Table 8.1 shows livestock population by groups of species. Generally speaking, comparison on livestock are not so easy due to the fact that firstly not all countries reported on each species, and, secondly, countries often do not report on the number of holdings rearing livestock by species. Hence comparison on concentration or mean size of herds is rarely possible. While making comparison, it is believed that if a particular species is important for a country, it is more likely to appear in its agricultural census. Conversely, the species not reported in the census of a country is more likely to be less important species for the country. This belief makes us move forward with some comparison. As the results bear only on countries reporting census results, the percentages used below are widely rounded. Just considering absolute numbers of heads at country level leads to the following key observations for the main species.

Cattle

4.2.14 Table 8.2 presents information on the number of holdings rearing cattle and the total number of heads on the holdings in each country. Cattle is the species which seems to be widely spread over the planet. Among African countries, the biggest stock of cattle is in Ethiopia. In North and Central America the USA owns about 80 percent of cattle. In South America it is Brazil which owns about 60 percent of cattle, a herd more than three times larger than in the Argentina which is the next largest cattle owner. Also about 60 percent of cattle in Asia are in India, much higher than China which owns a bit more than 20 percent of the Asian cattle stock. In Europe, France has about 20 percent of the stock, but the French stock represents only 2 percent of the total number of cattle worldwide.

4.2.15 The concentration ratios¹⁰ for cattle cannot be calculated for all countries, but it is certainly not the countries with the largest stock of cattle which also have the highest concentration ratios (intensive raising on the holding). In Asian and African countries for which ratios are available, the mean herd size never exceeds 40 animals per holding (38 in Botswana and 27 in Japan, ignoring Cyprus which has so few holdings). In most of the European countries individual herds are often between 40 and 100 heads (96 in the UK). The largest herds of cattle are certainly to be found in America (94 in the USA; 127 in Canada; 212 in Uruguay). In Oceania, Australia is at the top of the world list of countries with the largest cattle herd concentration, with an average of 351 heads of cattle per holding.

Chart 1. Number of holdings with cattle

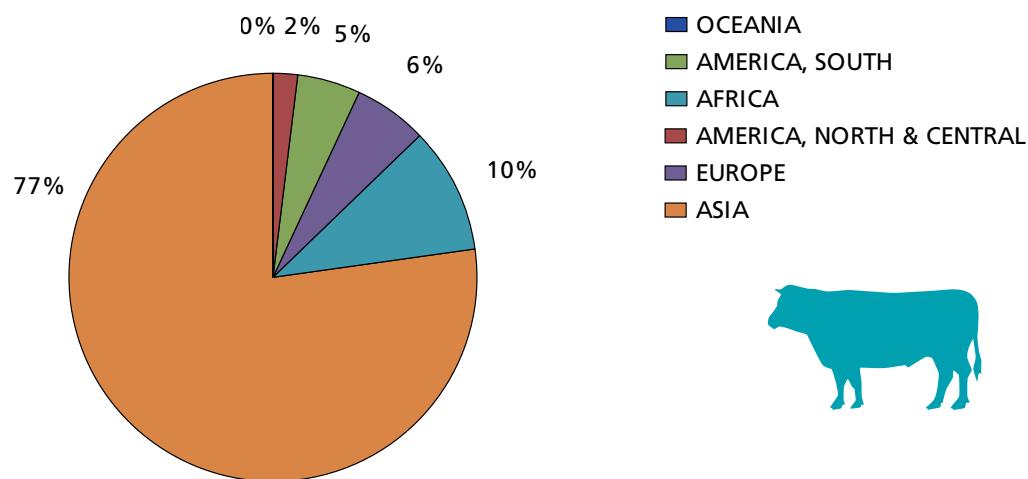

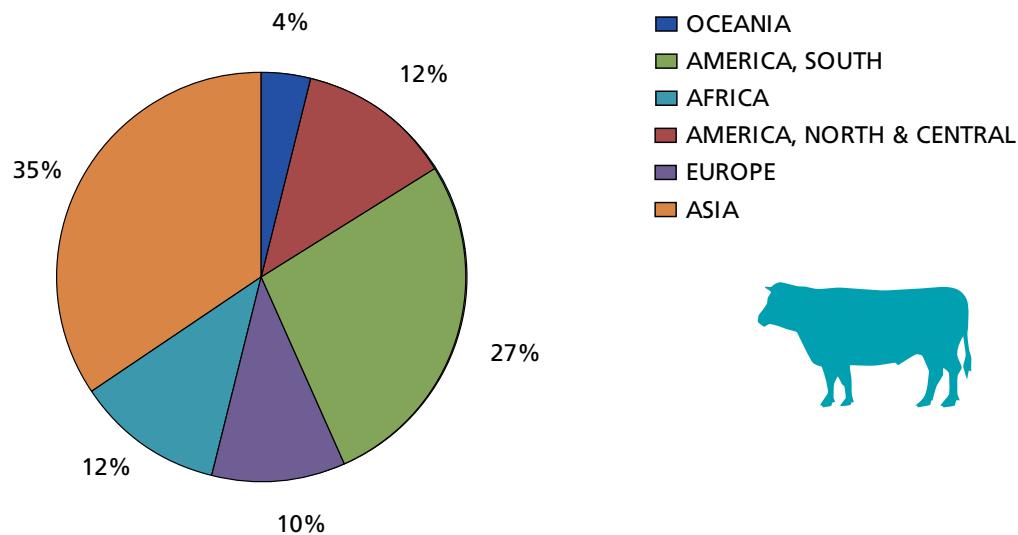

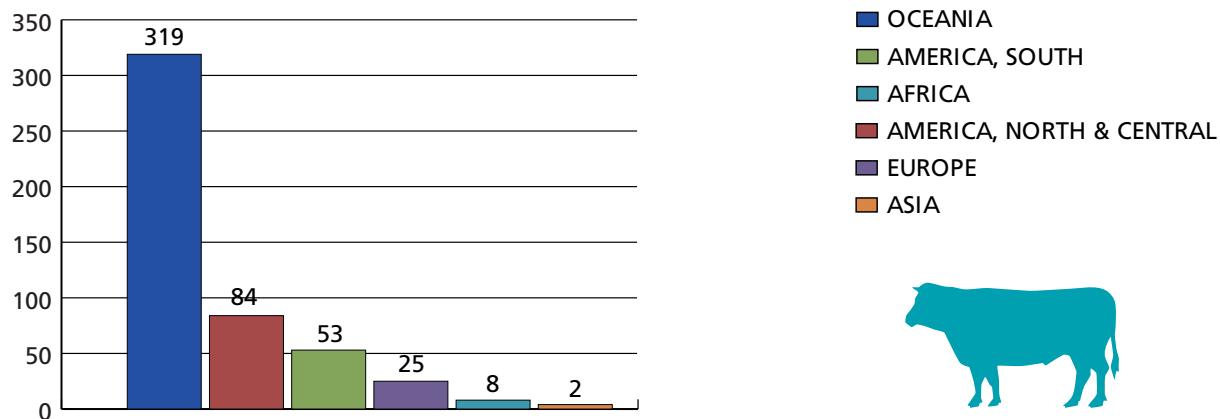

Chart 2. Number of heads of cattle

¹⁰ average herd size on a holding to indicate the intensity of raising

Chart 3. Distribution of cattle by region

Buffaloes

4.2.16 Table 8.3 gives information on buffaloes for 21 countries. Asian countries keep 97 percent of buffaloes. India alone had 62 percent of the buffalo population reported by the 21 countries, while China has only 13 percent. However, it is worth mentioning some specific location of herds of buffaloes in South America; in Brazil, but also 500 holders in Venezuela who raise more than 62 000 buffaloes altogether, that is 117 heads per holding. In Italy, about two thousand holders raise about 182 thousand buffaloes, with average heard size of 90 buffaloes. The highest buffalo concentration in the world is in Australia, where 15 farmers report 7327 heads of buffalo, with an average of 488 heads per holding.

Sheep

4.2.17 Table 8.4 refers to sheep. It is commonly believed that sheep are mostly raised in Oceania. In fact, it is principally a matter of concentration, even if Australia and New Zealand have together about 150 million sheep, with just over two thirds in Australia, and less than one third in New Zealand. The Oceania herd represents a little more than 20 percent of the world herd. The mean size of the individual herd in Australia reaches about 2227 heads per holding (no figure available for New Zealand).

4.2.18 The Asian countries raise about 40 percent of sheep (with almost as many sheep in China as in Australia). African countries also have a significant share (16 percent) in the world sheep stock, principally located in Maghreb (Algeria and Morocco), Ethiopia and South Africa. European herds of sheep are about 16 percent, with peak concentration in the UK where the mean size of individual herds is more than 500 heads per holding, triple the Spanish herds which are second in Europe for sheep concentration.

Chart 4. Number of holdings with sheep

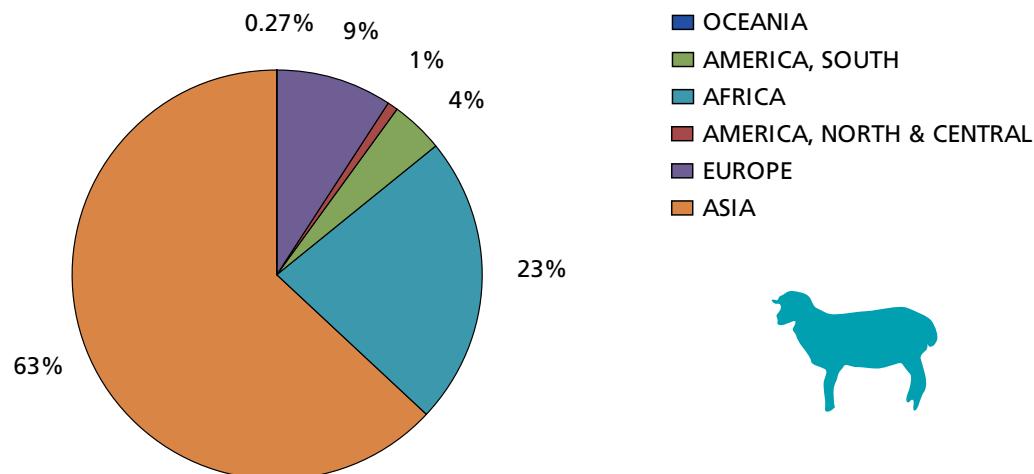

Chart 5. Number of heads of sheep

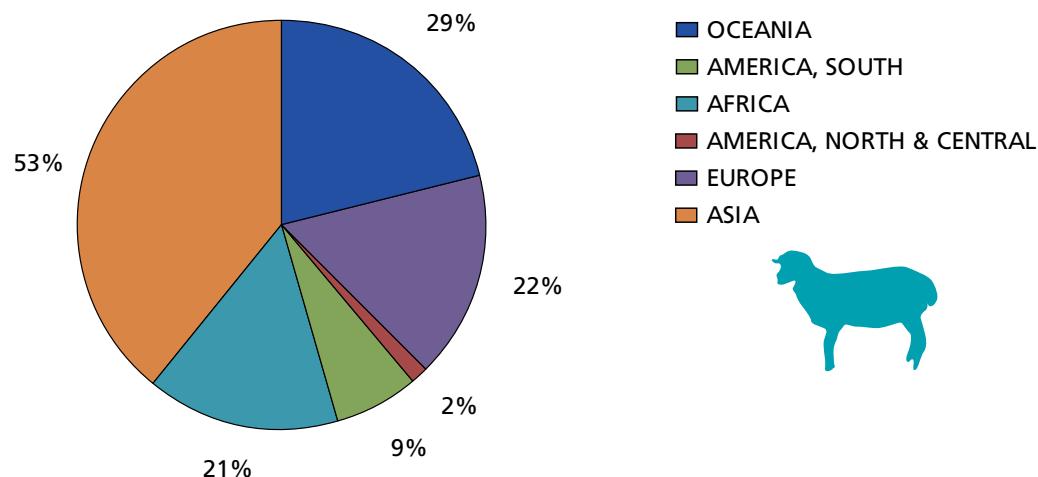

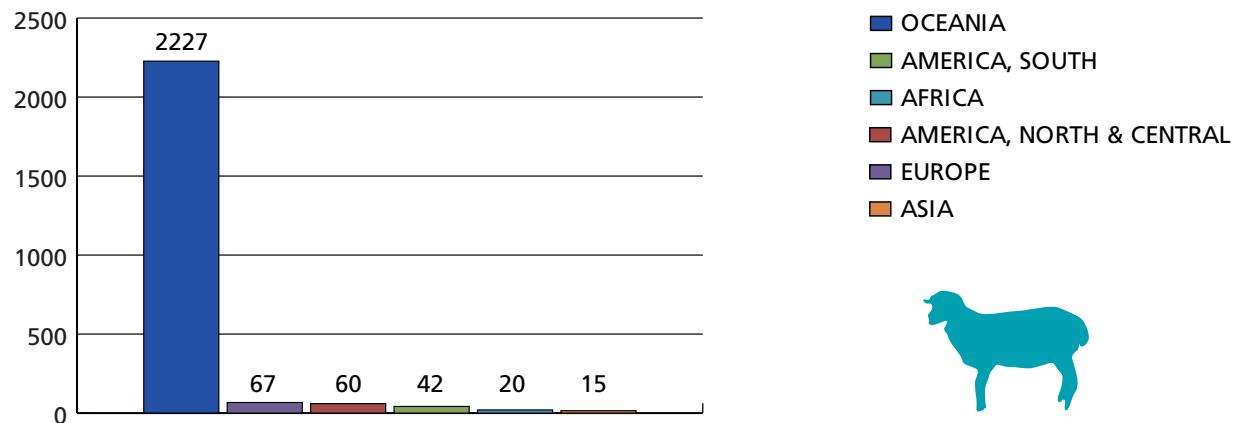

Chart 6. Average number of sheep heads per holding

Goats

4.2.19 Table 8.5 provides information on goats from 99 countries. Three quarters of goats are raised in Asian countries (China, India and Pakistan mostly), with less than 4 percent of goats in America, and 3 percent in Europe with almost half of them located in Greece. In Africa, Ethiopia and Tanzania there is the largest goat population, though big heard sizes are reported in Botswana, Morocco and South Africa. Globally speaking, the largest heard sizes are found in Qatar, Lebanon, Saudi Arabia and Cyprus.

Chart 7. Number of holdings with goats

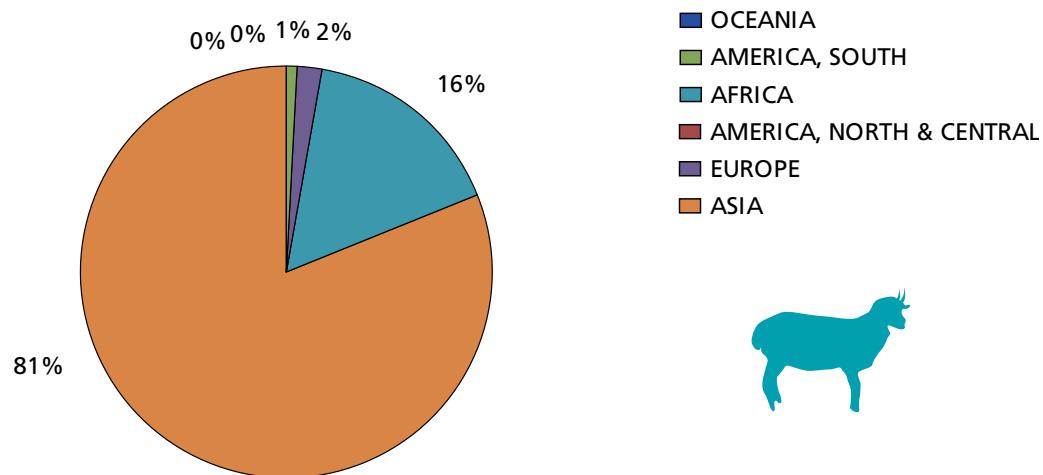

Chart 8. Number of heads of goats

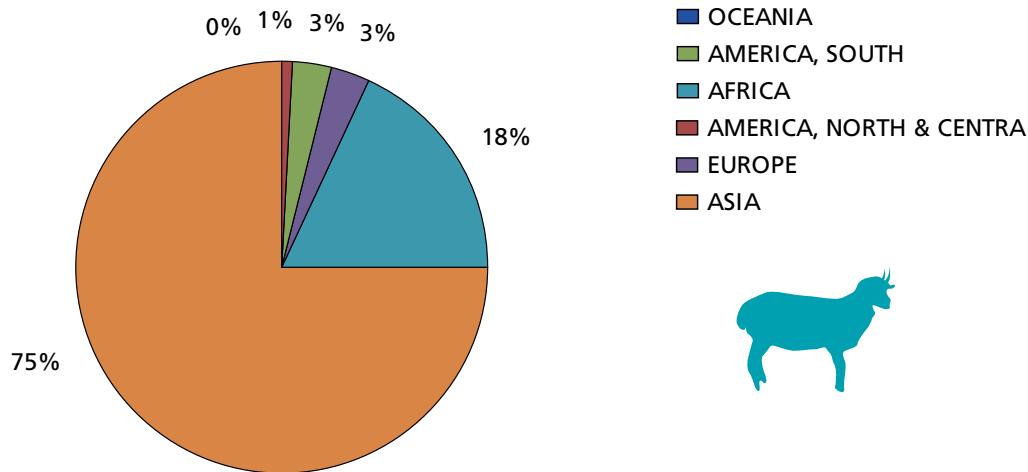

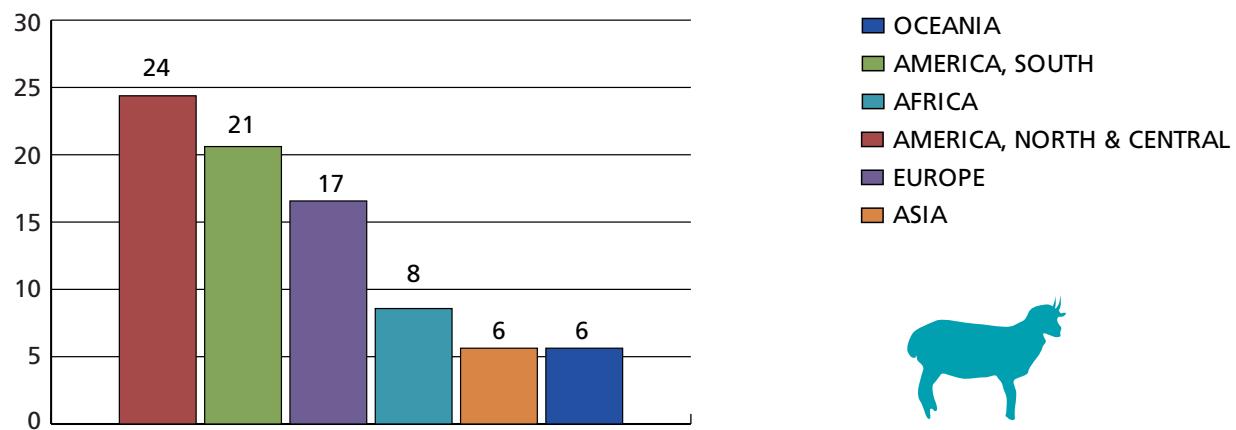

Chart 9. Average number of goat heads per holding

Pigs

4.2.20 Table 8.6 refers to information on pigs from 93 countries. About 56 percent of pigs are raised in Asian countries, mainly in China, which has more than 90 percent of the Asian pigs in its territory. European countries are also importantly involved in raising pigs: they, altogether, raise 25 percent of pigs worldwide, practising mostly intensive raising with impressive peaks of concentration such as 1354 heads per holding on average in Ireland, 826 in Netherland, 751 in Denmark, and 720 in Belgium (comparable to 765 in the USA). In Australia the average number of pigs per holding is 790.

Chart 10. Number of holdings with pigs

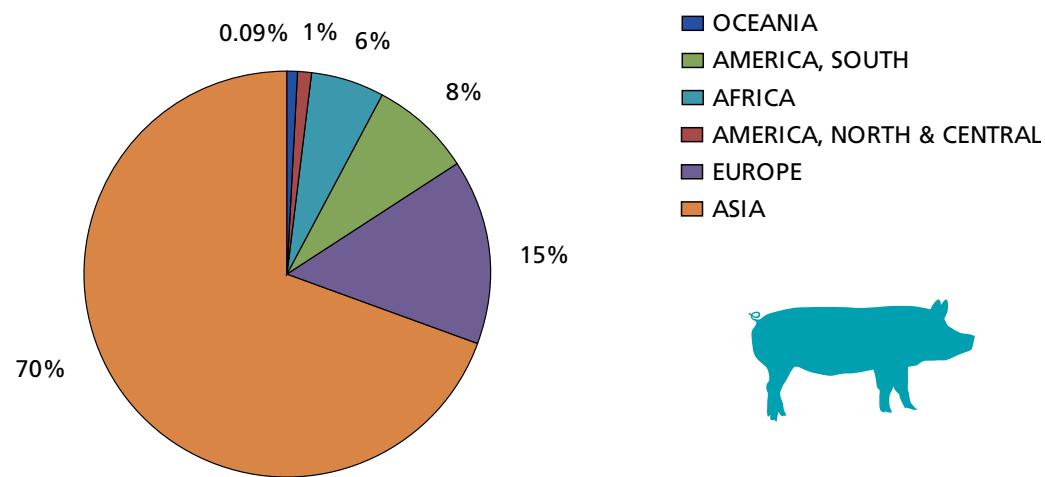

Chart 11. Number of heads of goats

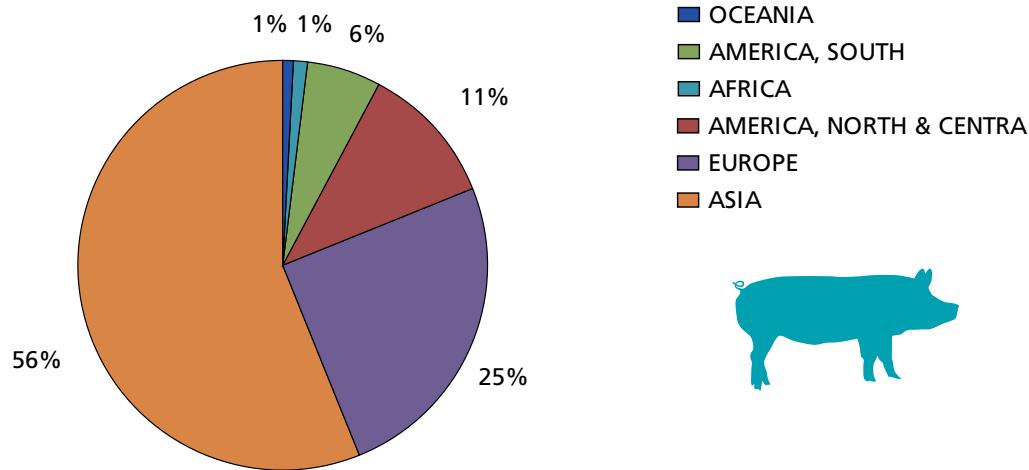

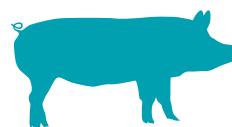

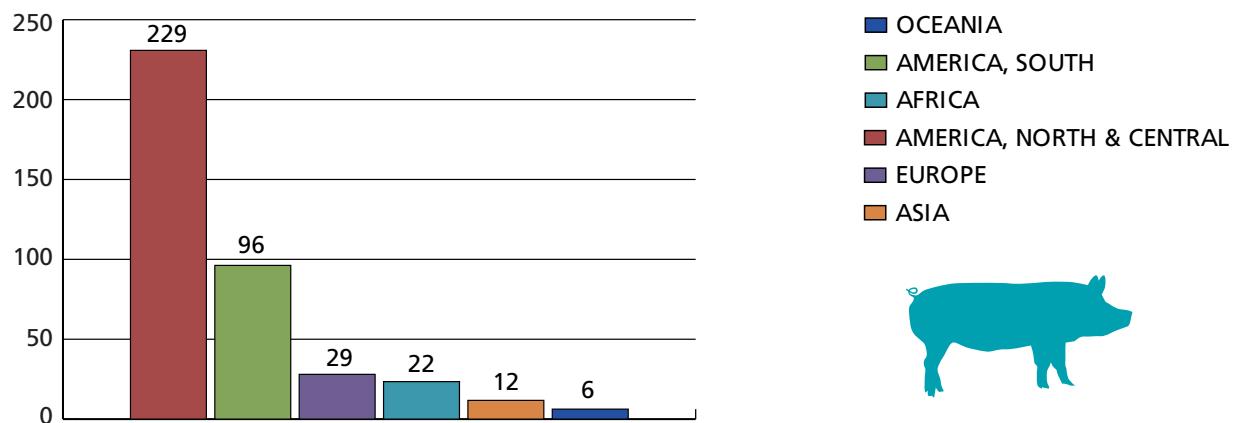

Chart 12. Average number of pigs heads per holding

Horses

4.2.21 Table 8.7 provides data on horses from 74 countries. China with 8 million horses has the largest population. The exact population of horses in Myanmar is not clear as the number includes other big livestock species. Other countries having notably high populations of horses are Brazil, the USA, Columbia, Mongolia, South Africa, and Ethiopia, in decreasing order of number of heads. The holdings having the largest number of heads of horses are found in South Africa.

CONCEPTS AND DEFINITIONS

Chickens

4.2.22 Table 8.8 presents data for chickens from 99 countries. It may be noted from the footnotes on the data in the tables, that often data have limitations. For some countries, the population is restricted to only broilers or layers, for others it relates to all types of poultry. The other limitations arise from the fact that some censuses may ignore backyard raising of chickens, and the households with backyard poultry are not enumerated as they do not qualify as agricultural holdings as per the threshold used for the census. Nonetheless, broadly speaking, some conclusions are possible. One third of chickens are raised in North America, of which 90 percent are in the USA, which appears to be, by far, the main raiser (note that no figure is available for China). Brazil, the second country according to number of poultry, represents only 40 percent of the USA, and India, the third, 25 percent of the USA. Chickens are spread all over Europe, but all the European countries together raised only 23 percent of the world poultry, a bit more than Asian countries (not counting China again) and South America.

Chart 13. Number of holdings with chickens

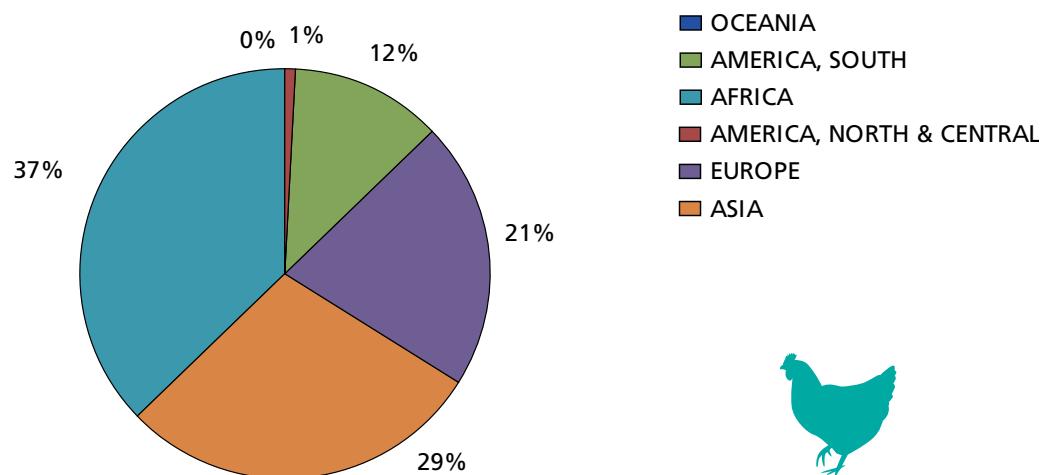

Chart 14. Number of heads of chickens

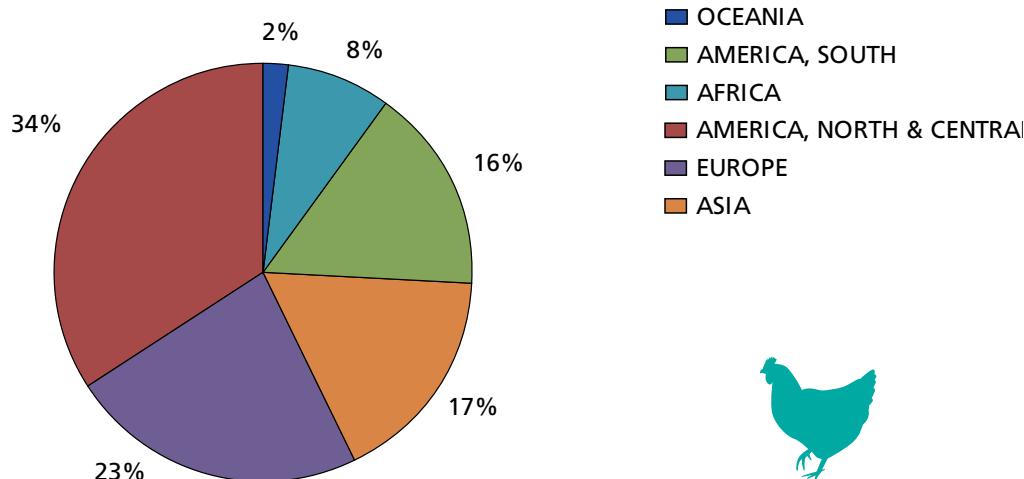

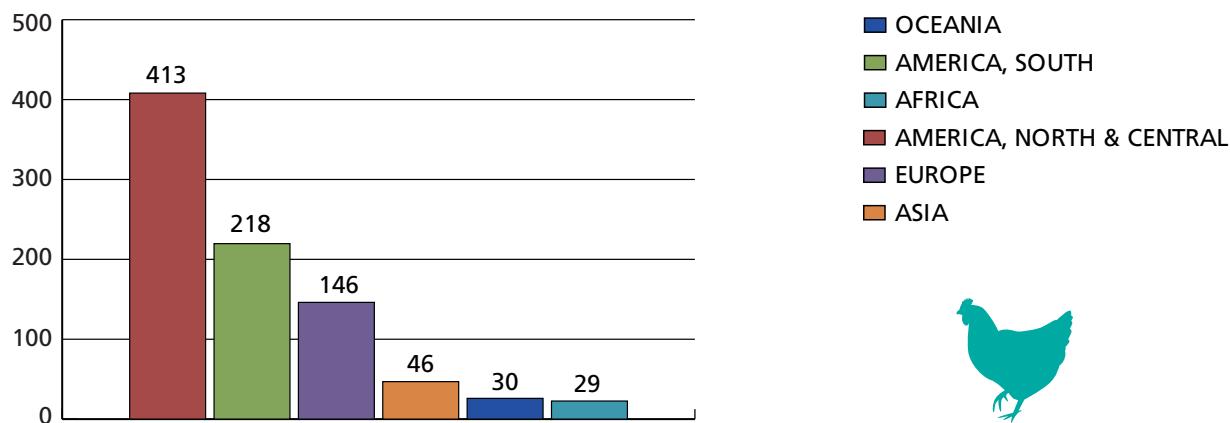

Chart 15. Average number of chickens heads per holding

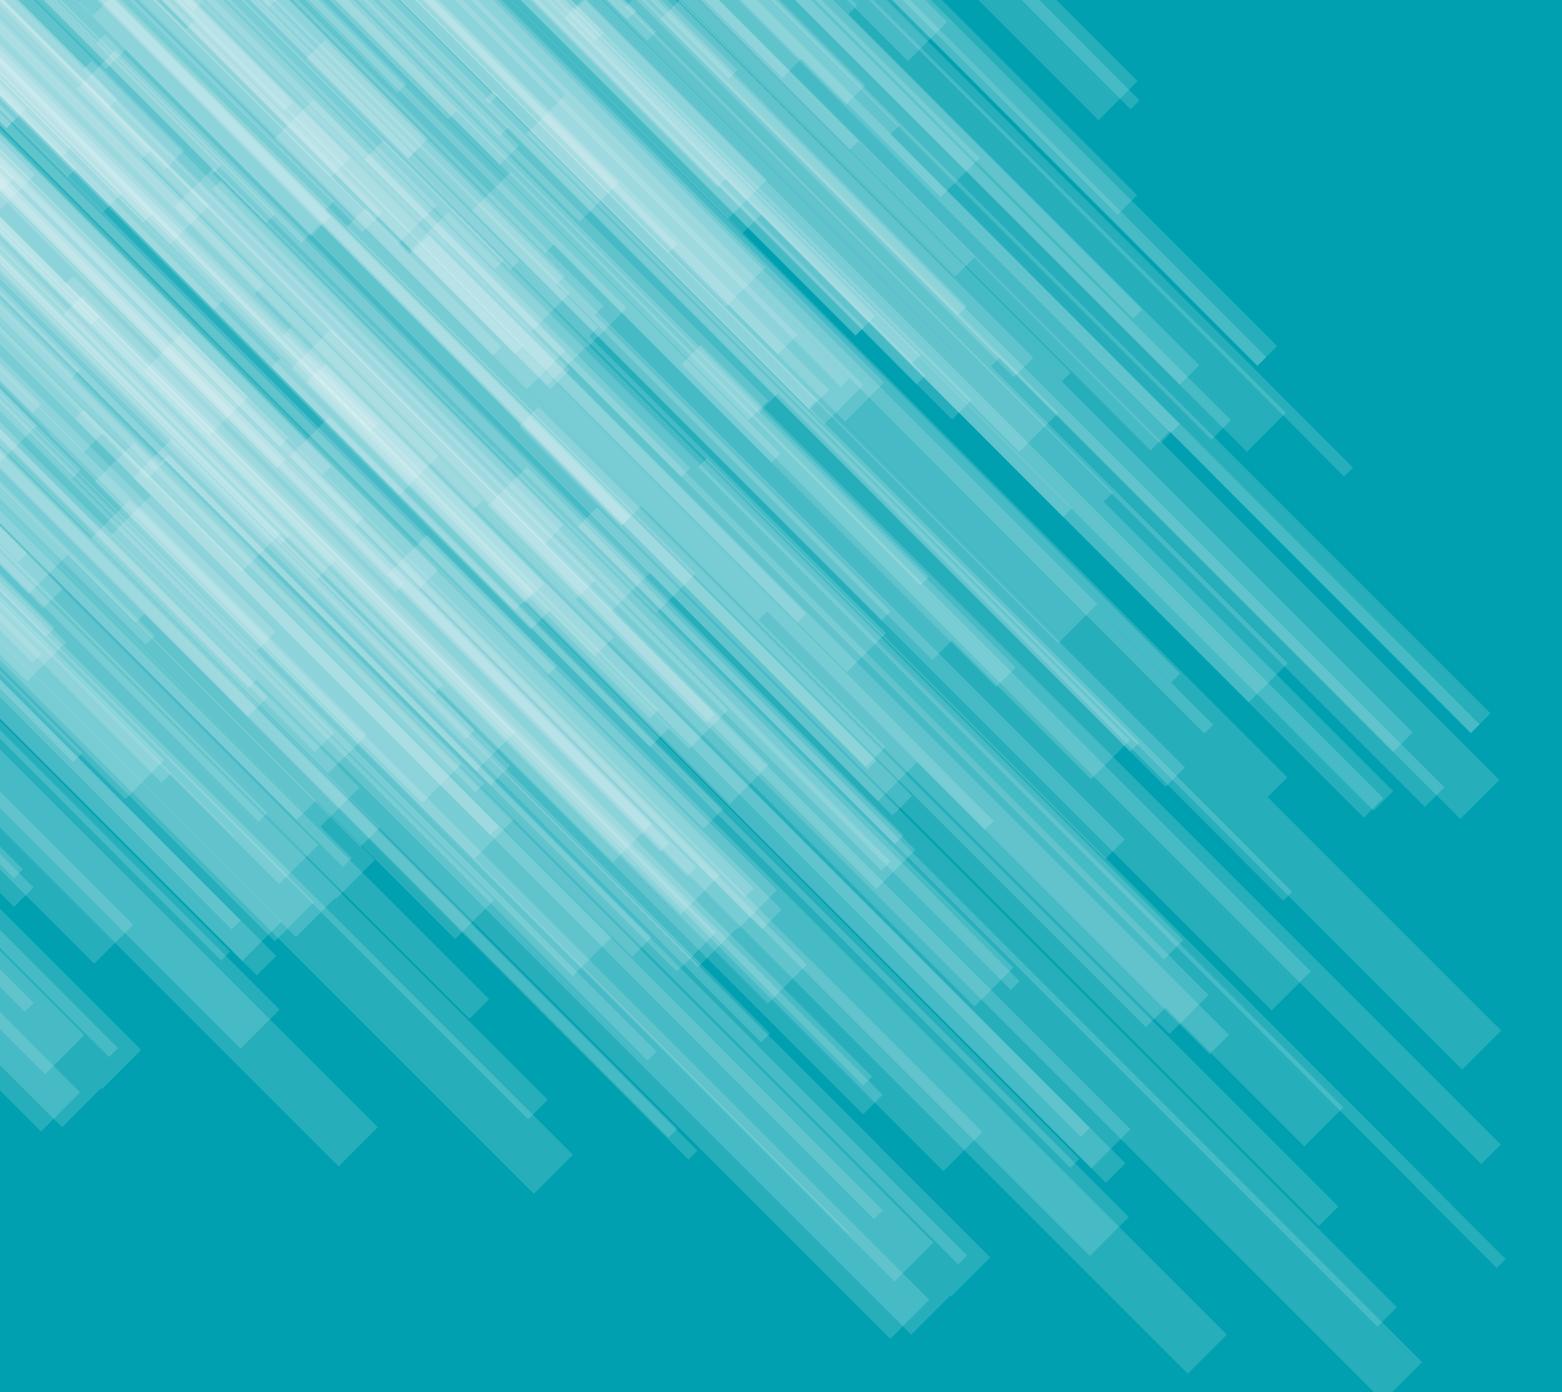

Agriculture machinery

4.2.23 Table 9.1 provides data on tractors form 36 countries, separately for 4 wheel tractors and track laying tractors. Besides the limitations on number of countries collecting data on machinery, often no distinction is made in the capacity of the machinery. From the limited data that are available it is clear that the use of machinery in Europe is much higher than in Asia and Africa. Among the reporting countries, France has the largest number of tractors, but the highest number of tractors per holding are found in Luxemburg and Denmark.

Irrigation

4.2.24 An attempt was made to compile data on at least two common indicators of irrigation, viz. number of holdings using irrigation and area irrigated. Table 10.1 presents the results from 15 countries. Among these countries, Egypt leads the list as nearly 77 percent of holdings use irrigation and a similar percentage of the holding area is irrigated. It was surprising to note that only 14.1 percent of holdings in the US reported irrigation and the irrigated area was only 5.9 percent of the holding area.

CONCEPTS AND DEFINITIONS

PART TWO

International Comparison Tables

Table 1.1 Geographical coverage and minimum size of holding

Countries by region	CENSUS YEAR	GEOGRAPHICAL COVERAGE	THRESHOLDS USED FOR COVERAGE OF HOLDINGS	
1	2	3	4	
WORLD TOTAL (114)		1996-2005		
AFRICA (25)				
Algeria	2001	Entire country	Not reported	
Botswana	2004	Urban areas excluded	Not reported	
Cape Verde	2004	Entire country (rural and urban areas)	Not reported	
Comoros	2004	Entire country	Not reported	
Côte d'Ivoire	2001	Entire country (rural and urban areas)	Not reported	
Egypt	2000	Entire country	At least 12 Sahm (87.5 square meters) used wholly or partly for agricultural production or a minimum of livestock: one head of cattle, buffaloes or camels; 5 heads of sheep or goats; 100 heads of poultry; 10 beehives; or ownership of one agricultural machine used in agriculture.	
Ethiopia	2001-2002	Some pastoralist areas of the Afar and Somali Regional States excluded.	Not reported	
Gambia	2001-2002	Entire country	Not reported	
Guinea	2000-2001	Entire country	Not reported	
Lesotho	1999-2000	Entire country	Not reported	
Libyan Arab Jamahiriya	2001	Entire country	Not reported	
Madagascar	2004-2005	Entire country	Not reported	
Mali	2004-2005	Entire country	Not reported	
Morocco	1996	Entire country	Not reported	
Mozambique	1999-2000	Cities of Maputo, Matola, Beira and Nampula were excluded and were investigated separately; some districts also were excluded.	Farms were classified as Small, Medium or Large according to four selection criteria: size of cultivated area, number of head of cattle, number of goats/sheep/pigs and/or number of poultry.	
Namibia	1996-1997	Six regions of the country (out of 13) covered, namely: Ohangwena, Omusati, Oshana, Oshikoto, Kawango and Caprivi	Holdings having planted at least one of the cereal crops, pearl millet (mahangu), sorghum, maize.	
Réunion	2000	Entire country	At least 1 ha of agricultural area in use; 20 acres (1 acre=0.40469 ha) of specialized crops; sufficient agricultural production estimated either in productive area (e.g. 10 acres of bananas of export varieties, 10 acres of sugarcane etc.) or in number of animals (e.g. 10 cows, 10 beehives etc.).	
Senegal	1998-1999	Urban areas and some departments and districts were excluded.	Not reported	
Seychelles	2002	Entire country	Not reported	
South Africa	2000	Entire country	Not reported	
Tanzania, United Republic of	2002-2003	Urban districts were excluded	At least 25 sq. m of arable land; 1 head of cattle; 5 goats/sheep/pigs; or 50 chickens/ducks/turkeys.	
Togo	1996	Entire country	Not reported	
Tunisia	2004	Entire country	At least 100 square meters of irrigated cultures; one hectare of not irrigated cultures; one milk cow; six female sheep or goats; 10 mares; 10 female camels; five hundred chickens and fifty laying hens; twenty beehives; fifty adult female-rabbits, five cages of adult males and five cages of young rabbits.	
Uganda	2002	Entire country	All households engaged in agricultural activities were covered. No investigation of private large scale and institutional farm sector was done.	
Zambia	2000	Entire country	Not reported	
AMERICA, NORTH AND CENTRAL (14)				
Canada	2001	Entire country	Production of some products intended for sale.	
Guadeloupe	2000	Entire country	At least 1 ha of agricultural area in use; 20 acres (1 acre=0.40469 ha) of specialized crops; sufficient agricultural production estimated either in productive area (e.g. 10 acres of bananas of export varieties, 10 acres of sugarcane etc.) or in number of animals (e.g. 10 cows, 10 beehives etc.).	
Guatemala	2003	Some areas excluded where security problems arose; 90.2 percent of holdings were covered.	Not reported	

Table 1.1 Geographical coverage and minimum size of holding

Countries by region	CENSUS YEAR	GEOGRAPHICAL COVERAGE	THRESHOLDS USED FOR COVERAGE OF HOLDINGS
1	2	3	4
Jamaica	1996	Entire country	In rural area a complex minimum size criterion was used. For farms located in urban areas or operated by urban dwellers the minimum area threshold of 50 acres (approx. 20 ha) was applied. Agricultural holding (Farm) is all land fully or partly utilized for agricultural purposes, located in a single Parish and consisting of one or more parcels, reporting at least one of the following characteristics (minimum size of holding): 0.41 ha of crop cultivation, including flowers; a greenhouse of at least 4400 square feet (1 sq. ft = 0.92 m ²); twelve economic trees like citrus, mangoes, breadfruit etc; one head of cattle; two pigs or sheep or goats; twelve head of poultry, (including ducks, turkeys etc); six beehives; or a fish pond of any size.
Martinique	2000	Entire country	At least 1 ha of agricultural area in use; 20 acres (1 acre=0.40469 ha) of specialized crops; or sufficient agricultural production estimated either in productive area (e.g. 10 acres of bananas of export varieties, 10 acres of sugarcane etc.) or in number of animals.
Nicaragua	2001	Entire country	Kitchen gardens in urban areas were not covered.
Panama	2001	Entire country	Not reported
Puerto Rico	2002	Entire country	Not reported
Saint Kitts and Nevis	2000	Entire country	At least one head of cattle or one donkey or horse; two heads of pigs, sheep or goats; a flock of at least 10 fowls or rabbits; 10 or more bearings of any tree crops, bananas or plantains or fruit trees; or 400 square meters of land under vegetables, provision, food or cash crops.
Saint Lucia	1996	Entire country	At least 0.05 ha of any temporary crop; 10 bearing trees of any tree crop or 100 mats of banana or plantain; one head of cattle; 2 pigs or 2 goats or 2 sheep or one head of any of the two; 12 poultry or 12 rabbits or 12 head of poultry and rabbits together.
Saint Vincent and the Grenadines	2000	Entire country	At least one head of cattle, donkey or horse; two head of pigs, sheep or goats; a flock of at least 12 fowls or rabbits; 10 or more bearings of any tree crops, bananas or plantains; 500 square meters of vegetables, provision, food or cash crops; or a raised stand or greenhouse of at least 18 square meters.
Trinidad and Tobago	2004	Entire country	Holdings producing primary for sale were covered.
United States of America	2002	Entire country	At least US\$ 1000 of agricultural products produced and sold during the census year.
Virgin Islands, United States	2002	Entire country	At least US\$ 500 of agricultural products produced and sold during the census year.
AMERICA, SOUTH (8)			
Argentina	2002	Urban areas and desert zones excluded	A market oriented production unit of over 500 square meters in area.
Brazil	1996	Entire country	Holdings consisting of only family gardens and forest holdings were excluded.
Chile	1997	Some information not included for Regions I, XI, XII	At least 0.1 ha of permanent pastures; 0.1 ha under temporary or permanent crop; 0.1 ha of wood plantations; 5.0 ha of wood or forest lands; 2 large livestock with more than 2 years of age; 4 large livestock with less than 2 years of age; 10 small livestock; 50 geese, ducks, rabbits; 100 chickens; or 10 beehives.
Colombia	2001	Urban, peri-urban areas and non-agricultural regions excluded.	Not reported
Ecuador	2000	Entire country	Operating at least 5 ares of land, totally or partially used for agriculture or produced one or more products for sale during the census year.
French Guiana	2000	Entire country	At least 1 ha of "superficie agricole utilisée", 20 ares of specialized cultures, or overstepping a certain production activity (e.g. having at least one cow).
Uruguay	2000	Entire country	One hectare or more land.
Venezuela, Bolivarian Republic of	1997	Entire country	Places with less than the minimum size, abandoned holdings and those used only for recreation, were not considered as agricultural holdings. Minimum size not reported.
ASIA (29)			
Afghanistan	2002	Barmal District in Paktika Province and parts of Ghor Province excluded	Not reported
Azerbaijan	2004-2005	Occupied lands excluded	Not reported
Bangladesh	2005	Entire country	Households operating at least 0.05 acres of land were considered.
Bhutan	2000	Entire country	Not reported
China	1997	Entire country	Not reported
Cyprus	2003	The area controlled by Government of Cyprus was covered.	At least 10 ares of agricultural land; 5 ares in greenhouses; one cow or two other large animals; five small animals; fifty heads of poultry; or twenty beehives.
Georgia	2004	Uncontrolled territories in Abkazia and Tskhinvali Region were not covered.	Holdings whose holders lived or head headquarters (incase of juridical persons) in 5 large cities (Tbilisi, Kutaisi, Batumi, Rustavi and Poti) were not covered.

Table 1.1 Geographical coverage and minimum size of holding

Countries by region	CENSUS YEAR	GEOGRAPHICAL COVERAGE	THRESHOLDS USED FOR COVERAGE OF HOLDINGS
1	2	3	4
India	2001 & 2003	States of Bihar, Jharkhand and Meghalaya not covered. No data for Livestock Census in some districts. In some states urban areas were excluded.	Not reported
Indonesia	2003	Entire country	Not reported
Iran, Islamic Republic of	2003	Entire country	At least 400 sq. mt. of land under temporary crops or 200 sq. mt. of horticultural and permanent crops; 2 heads of sheep or goats; 1 head of cattle or camel; 10 heads of poultry; or a greenhouse; silk worms; or beehives. Modern poultry farms were not covered by the census.
Japan	2000	Entire country	Not reported
Jordan	1997	Entire country	At least one dunum (10 ares) of land; 10 sheep; 10 goats; one head of cattle; 3 camels; or 5 beehives.
Korea, Republic of	2000	Entire country	At least 0.1 hectares of arable land; selling more than 500,000 won (about US\$ 427) of agricultural and/or livestock products; or raising livestock for a total value of at least 500,000 won.
Kyrgyzstan	2002	Entire country	Not reported
Lao People's Democratic Republic	1999	Entire country	At least 0.02 hectares of agricultural land; 2 cattle or buffaloes; 5 pigs or goats; or 20 or more poultry.
Lebanon	1998	Entire country	At least 0.05 hectares of irrigated land; 0.025 hectares of not irrigated land; 0.01 ha of greenhouses; 1 cattle; 7 or more pigs or goats; or more than 15 poultry.
Malaysia	2003	Entire country	Only Crop holdings.
Mongolia	2000	Livestock holdings in the entire country.	Only livestock holdings.
Myanmar	2003	Highly urbanized areas and those facing security problems excluded.	At least 0.1 acres of land, i.e. about 4 ares; 4 heads of small livestock; 2 heads of large livestock; or 30 heads of chicken or ducks.
Nepal	2002	Entire country	At least 0.012 hectares under crops in hill/mountain districts or 0.014 hectares in lowland districts; 2 cattle or buffaloes; 5 sheep or goats; 20 poultry; or a combination of livestock equivalent to 2 cattle/buffaloes. Holdings operated by juridical persons were not covered.
Pakistan	2000	Entire country	Households having at least 1 head of cattle/buffaloes or 5 heads of sheep/goats.
Philippines	2002	Entire country	At least 1000 square meters of crops such as palay, maize, fruits, vegetables, nuts, etc., and/or livestock and/or poultry, regardless of number; or any land regardless of area used for the raising of at least 20 head of livestock and/or 100 poultry.
Qatar	2000	Entire country	At least one cow; one camel; five heads of sheep or goats; or fifty heads of poultry.
Saudi Arabia	1999	Agriculturally productive regions covered.	Not reported
Sri Lanka	2002	Municipalities of Colombo, Dehiwala, Mount Lavinia and Sri Jaywardanepura, predominantly used for residential and commercial purposes, were not covered.	Holdings with less than 0.11 ha area and producing mainly for home consumption (called Marginal or Inactive Holdings) were excluded.
Thailand	2003	Entire country	Not reported
Turkey	2001	Entire country	Not reported
Viet Nam	2001	Entire country	Not reported
Yemen	2002	Entire country	Not reported
EUROPE (29)			
Albania	1998	Entire country	Not reported
Austria	2000	Entire country	Utilized Agricultural Area (UAA) of at least one hectare; or 2500 sq. mt. of commercial vineyards; 1500 sq. mt. of orchards; 1000 sq. mt. of berries or vegetables etc; or 1000 sq. mt. of greenhouses; cultivating mushrooms; owning 3 cattle; 5 pigs; 10 sheep or goats; or 100 head of poultry.
Belgium	2000	Entire country	Operating at least 1 ha or production for sale.
Croatia	2003	Entire country	Not reported
Czech Republic	2000	Entire country	At least 1 ha of agricultural land; 0.15 ha of vineyards or horticulture plantations; 0.05 ha of greenhouses; owning 1 head of cattle; 2 pigs; 4 sheep/goats; 50 poultry; or 100 fur bearing animals.

Table 1.1 Geographical coverage and minimum size of holding

Countries by region	CENSUS YEAR	GEOGRAPHICAL COVERAGE	THRESHOLDS USED FOR COVERAGE OF HOLDINGS
1	2	3	4
Denmark	2000	Entire country	At least 5 hectares of agricultural land; or reaching a certain threshold of economic size.
Estonia	2001	Entire country	At least 1 ha of agricultural or forest land; 0.3 ha of fish ponds; or half production for sale.
Finland	2000	Entire country	At least 1 hectare of utilized arable land; or economic size of 1 European Size Unit (= ECU 1200).
France	2000	Entire country, including DOM.	At least 1 ha of Utilized Agriculture Area (superficie agricole utilisée); 0.2 ha of specialized crops; a certain number of livestock; or a certain level.
Germany	2000	Entire country	At least 2 ha of area; a minimum stock of animals (8 bovines, 8 pigs, 20 sheep, or 200 laying hens/ broilers/ geese); producing special crops (0.3 ha of vineyards/ hops/tobacco etc.); or 10 ha of wooded area.
Greece	2000	Entire country	At least 0.1 ha of Utilized Agricultural Area (UAA): 0.05 ha of greenhouses; one cow; two heads of other large livestock; 5 heads of small livestock (sheep, goats or pigs); 50 heads of poultry; or 20 beehives.
Hungary	2000	Entire country	At least 1500 sq. mt. of each or any combination of arable land, kitchen-garden, orchard, vineyard, meadows and pastures, forest, fish pond or reed; one head of large livestock; 50 hens or other poultry; 25 rabbits/fur-bearing animals or pigeons for meat; or intensive horticultural activities under glass.
Ireland	2000	Entire country	At least 1 ha of agricultural area; or an intensive agricultural production.
Italy	2000	Entire country	Not reported
Latvia	2001	Entire country	At least 1 ha of agricultural land; or LVL 1000 of agricultural products produced and sold during the last calendar year.
Lithuania	2003	Entire country	At least 1 ha of agricultural land; 40 minimum standards of living (MSL) income gained from agricultural products sales.
Luxembourg	2000	Entire country	At least 1 hectare of cultivated area; commercial units producing vegetables, fruit or flowers; owners of nurseries or osieries; or 0.1 ha of vineyards, commercial livestock or poultry breeding establishments.
Malta	2001	Islands of Malta and Gozo were covered.	Not reported
Netherlands	2000	Entire country	At least 3 ESU (European Standard Unit)
Norway	1999	Entire country	At least 0.5 ha of agricultural area; 300 square meters of greenhouses; 0.2 ha of field grown vegetables; 0.1 ha of field-grown berries; 0.1 ha under fruit trees; 0.1 ha of nurseries; 10 heads of cattle; 25 sheep over one year of age; 10 goats over one year of age; 5 breeding pigs and/or 200 other pigs; 1000 laying hens; or 5000 chickens for meat production.
Poland	2000	Entire country	At least 0.1 ha of agricultural land; 1 head of cattle; 5 heads of pigs; 1 sow; 3 heads of sheep or goats; 1 horse; 30 heads of poultry; or 5 females of fur animals.
Portugal	1999	Entire country	At least 1 ha of agricultural land; 0.05 ha of flowers or greenhouses or nurseries; 0.1 ha of specialized cultures; 0.2 ha of industrial crops or orchards; 0.5 ha under potatoes or other crops extensively cultivated; 1 breeding bull; 1 cow; 2 heads of cattle two years old; 3 pigs for fattening; 1 swine; 6 sheep or goats; 10 female rabbits; 100 chickens or other fowls; 10 beehives; or a certain livestock production for the 1998/99 agricultural season.
Romania	2002	Entire country	Not reported
Serbia	2002	Excluding Kosovo and Metohia.	At least 0.1 ha of cultivable land; or a cow and a calf or a cow and a heifer; or a cow and two fully grown heads of small livestock; or 5 fully grown sheep; or 3 fully grown pigs; or 4 fully grown heads of sheep and pigs together; or 50 heads of fully grown poultry; or 20 beehives. Holding operated by legal persons were not covered.
Slovakia	2001	Entire country	At least 0.5 ha of utilized agricultural land; 0.15 ha of land area of intensive crops (orchards, vegetables or flowers); 0.05 ha of land area under vineyard; 0.03 ha of root/tuber crops in compact plantation; 1 head of cattle or 2 heads of pigs or 4 heads of sheep or goats, 50 heads of poultry; 100 heads of fur-bearing animals, 100 hares or 5 beehives.
Slovenia	2000	Entire country	At least 1 ha of utilized agricultural land; 0.5 ha of arable land and kitchen gardens; 0.3 ha of vineyards and/or orchards; 0.1 ha of orchard plantation; 2 heads of cattle; 50 beehives; or market producer of vegetables.
Spain	1999	Entire country	At least 0.1 ha of land; 1 head of cattle; 2 horses, asses, mules or pigs; 6 sheep or goats; 50 chickens or other poultry; 30 female rabbits; or 10 beehives.
Sweden	2000	Entire country	At least 2.1 ha of arable land; 50 cows; 250 cattle; 50 sows; 250 pigs; 50 ewes; 1000 poultry; 200 square meter area under glass; or 2500 square meter outdoor cultivation.
United Kingdom	2000	Entire country	In England and Wales Minor holdings were excluded. Minor holding are those with less than 6 ha, no regular whole time worker, estimated labour requirements less than 100 days, or glass house less than 100 square meters.

10 Crop holdings.

11 The decline in area as compared to 1970 is due to changes in concepts. The 1970 figure also includes communal forests and pastures.

Notes

- The figure in the first column refers to the number of countries covered in the 2000 round of WCA in different regions.
- The data prior to 2000 WCA has been taken from the published reports of previous rounds. It is quite possible that a few countries which provided their reports to FAO after publication of the Reports on the WCA rounds are not included in this table.
- Former countries, like former Yugoslavia and former Czechoslovakia have been included in the table for historical reasons. The figure in the square brackets refer to countries covered in the 2000 round of WCA.
- Ethiopia: For the 1990 round of WCA, data are originating from 2 surveys: (i) data on holdings, holders, farm population, land use and crops are from the 1988-89 Cropland Utilization Survey holdings; (ii) data on livestock are from the 1991-92 Livestock and Poultry Sample Survey. For the 2000 round of WCA, data are originating from the 2001/02 Ethiopian Agricultural Sample Enumeration (EASE).

Notes

- The totals given for the World and the Regions are "incomplete". They are reported here to indicate the extent of coverage by the censuses included in this report and/or for deriving indicators based upon available data.
- Agricultural population is defined as all persons depending for their livelihood on agriculture, hunting, fishing and forestry. It comprises all persons economically active in agriculture as well as their non-working dependents. It is not necessary that this referred population exclusively comes from rural population.
- Definition of holdings refers to agricultural holdings only.

Table 1.4 Number and area of holdings classified by land size

Notes

- World and regional averages and medians of averages are based on data included in the table.

1 The figure refers to agricultural area.

2 The figure refers to cultivated area.

3 This refers to number of fields (Crop Plots).

4 Source: Population and housing census 2002.

5 Crop holdings.

6 The figure refers to crop land.

7 The figure refers to arable land.

8 The figure refers to agricultural land of which 13 930 710 ha is utilized agricultural area.

Notes:

- For limitations on data reported in this table, please refer to notes on the table 1.1

CAUTION:

Pooled averages and median of averages reported here for regions are not precisely representative of the regions due to lack of data for many countries in different rounds. However, these have been calculated to capture the broad regional tendencies on the basis of available data. The reader should also be aware that the pooled averages may carry a dominant influence of data for some countries. For example South Africa and Namibia dominate the pooled average(s) for Africa. Pooled averages for North and Central America are dominated by Canada, Mexico and USA. In Oceania, the pooled averages are dominated by figures of Australia and New Zealand. Also while observing the trends in averages over different rounds, attention should be paid to the countries included in the calculation of averages, which may differ for various rounds.

2 Agricultural land.

3 Includes 3 350 483 ha of fallow land.

4 Land under crops + permanent meadows and pastures.

5 Includes 839 949 ha of fallow land

6 Land under temporary crops.

7 Includes 3500 ha of other cropland.

8 Includes 1 680 555 ha of other land under crops.

9 All other agricultural land

10 Harvested cropland.

11 Other cropland.

12 Cultivated area.

13 Includes 5 395 ha of fallow land.

14 Cropland.

15 Arable land.

16 Productive land.

17 Includes 51 225 ha of other cropland.

18 Includes 171 500 ha of utilized agricultural land.

19 Includes 1761 ha of fallow/unutilized land.

20 Includes 836 ha of fallow land.

21 Includes 168 884,74 ha kitchen gardens

22 Includes forest and other wooded land.

Notes

- This table is based on data reported in Table 6.1. Please refer to notes and footnotes on the data for different countries.
- Total area of holdings (col.6) = arable land (col.6) + permanent crops (col.9) + permanent meadows and pastures (col.10) + forest and other wooded land (col.12) + all other land (col.13)

Table 6.3 Use of arable land for food production and cropping intensity

1 Physical area: land area counted only once even if cultivated more than once in a year.
 2 Cropped area: the physical area of land is counted as many times as it is cultivated.
 3 Area under temporary food crops (col.5)= cereals (col.6) + sugar crops (col.7) + leguminous crops (col.8) + vegetables/melons (col.9) + temporary oilseed crops (col.10) + root/tuber crops (col.11).

4 Cropland = arable land + land under permanent crops.

5 Agricultural area = arable land + land under permanent crops + land under permanent meadows and pastures.

7 Includes 78 940 ha of rubber plantation.

1 Physical area: land area counted only once even if cultivated more than once in a year.

2 Cropped area: the physical area of land is counted as many times as it is cultivated.

3 Cropland = arable land + land under permanent crops.

5 Agricultural area = arable land + land under permanent crops + land under permanent meadows and pastures.

6 Area under crops.

7 Includes 78 940 ha of rubber plantation.

Table 7.1 Cereals: area under crops

Notes

- Totals in table refer to only the countries on which information was available.
- This area refers to gross area under the crop and not the physical area of the plot on which the crop is cultivated. For example, if a crop is cultivated twice on the same plot of land the area under the crop will be double of the physical area of the plot.
- For preparation of this table Indicative Crop Classification (ICC) [FAO, 2005] has been used. Some countries have reporting data only for broad categories and not for individual crops.

- 1 Agricultural area.
2 Area harvested.
3 Area cultivated.

- 4 Area planted.
5 Area sown.
6 Area under crops.

- 7 Cropland area.
8 Arable land.
9 Total cereals as reported by the country.

1 Holdings reporting maize for grain/maize (fresh).

2 Includes 235 962 ha of maize for silage.

3 Holdings reporting white, yellow and other maize.

4 Holdings reporting sweet maize/hard maize.

5 Crop holdings.

6 Maize for seed.

7 Holdings reporting summer maize.

Table 7.5 Fibre and other selected industrial crops: number of holdings reporting and/or area

1 Includes mules and asses.

2 Households.

3 Households with livestock.

4 Crop holdings.

5 Includes also cattle, buffaloes, mules, asses.

6 The country reports also 318 826 asses and 73 331 mules.

7 The country reports also 37 758 asses and 17 244 mules.

CONCEPTS AND DEFINITIONS

The concepts and definitions used in the publication are based on the Programme for the World Census of Agriculture 2000, FAO Statistical Development Series 5; World Programme for the Census of Agriculture 2010, FAO Statistical Development Series 11, EUROSTAT guidelines, and FAOSTAT definitions.

Agricultural area

Agricultural area consist of cropland and permanent meadows and pastures.

Agricultural census

Agricultural census or census of agriculture is defined as a large-scale, periodic, statistical operation for the collection of quantitative information on the structure of agriculture. The word "census" implies a complete enumeration of all agricultural holdings. However, by extension it also implies sample enumeration, provided the sample is large enough to generate sub-national data.

Agricultural holder

Is defined as the civil or juridical person who makes the major decisions regarding resource use and exercises management control over the agricultural holding operation. The agricultural holder has technical and economic responsibility for the holding and may undertake all responsibilities directly, or delegate responsibilities related to day-to-day work management to a hired manager.

Agricultural holding

An agricultural holding is an economic unit of agricultural production under single management comprising all livestock kept and all land used wholly or partly for agricultural production purposes, without regard to title, legal form, or size. Single management may be exercised by an individual or a household, jointly by two or more individuals or household, by a clan or tribe, or by a juridical person such as a corporation or a government agency. The holding's land may consist of one or more parcels, located in one or more separate areas or in one or more territorial or administrative divisions, providing the parcels share the same production means utilized by the holding, such as labour, farm building, machinery or draught animals.

Agricultural household

Agricultural household is a household managing an agricultural holding.

Agricultural land

See *Agricultural area*.

Agricultural population

Agricultural population comprises all members of an agricultural households. It is not necessary that this population exclusively come from rural population.(See Table 1.3)

Arable land

Arable land consists of land under temporary crops, permanent crops and temporarily fallow land.

Area, harvested

Area harvested refers to the total area from which the crop is gathered. Thus, area destroyed because of drought, flooding, pest attack or any other reason is excluded. In this regard, a certain percentage loss criterion – for example, yield is less than 20% of what it normally is – is used to determine if a crop is destroyed. Crop that is damaged but not destroyed is included in the area harvested. If possible, the area harvested should exclude uncultivated patches, footpaths, ditches, headlands, shoulders and shelterbelts. (Refer to [FAO 2005] Statistical Development Series 11).

CONCEPTS AND DEFINITIONS

Area of holding

Area of holding provides a measure of the size of the holding, and is an important element in the agricultural census analysis. It refers to all land managed by an agricultural holding, without regard to the right to access the land. Area of holding is defined as area of land managed by an agricultural holding which includes the land owned by the holder plus the land rented-in plus the land operated under other form of tenure.

Area, operated

See area of the holding.

Area, owned or in owner like possession

Area owned is the holding land for which the holder possesses title of ownership and has the right to determine the nature and extent of its use. The land under tenure form which give owner like possession will fall under this category. As it is a sub-category of area operated by the holder, for the purpose of agricultural census it does not include area owned by the holder but rented to others.

Area, physical

Physical area refers to physically measured area of the land, without regard to the number of times it was cultivated in a year.

Area, rented

It refers to land rented or leased-in by the holder from other persons, usually for a limited time period. At aggregate level it refers to total area of all lands rented-in by all holdings.

Area under agriculture

Area under agriculture is defined as area of holdings divided by country area. This is a non-standard indicator computed in this publication sole for analytical purposes to ascertain importance of agriculture in the country.

Area under crops

See gross cropped area.

Average area per holding

It is the total area operated (managed) by all holdings in a country divided by number of holdings. Use of thresholds in the definition of holdings for the agricultural census purposes places some limitations on the use of this indicator for international comparison.

Average size of holding

This indicator gives an idea of scale of agricultural operations of holdings. Several alternative measures of size of agricultural holdings are possible. However, for simplicity and keeping in view availability of data "land operated by the holding" has been used as a measure of size of holding.

Broilers

Chicken reared mainly for production of meat.

Civil person

For the purpose of this report, "civil persons" includes the holders operating the holdings, according to the following three main legal status: (i) an individual; (ii) a household; (iii) two or more individuals of different households or two or more households. This category excludes holding operated by juridical persons or institutions such as companies, cooperatives, religious institutions. (See table 2.1)

Compact plantation

Area in compact plantation includes plants, trees and shrubs planted in a regular and systematic manner, such as in an orchard. Plants, trees or shrubs forming an irregular pattern but dense enough to be considered as an orchard, are also considered a compact plantation.

Country area

Country area refers to geographical area of the country including area under inland water bodies, but excluding offshore territorial waters. Possible variations in the data reported on this may be due to updating and revisions of the country data and not necessarily to any change of area.

Cropland

Crop land consist of arable land plus land under permanent crops.

Cropping intensity

Cropping intensity is the total area under crop (gross cropped area) divided by arable land.

Crop groups

- **Cereals** include wheat, rice, maize, sorghum, millet, barley, rye, oats and other cereals. See table 7.1
- **Vegetables and melons** include Leafy or stem vegetables, fruit- bearing vegetables, Root, bulb, or tuberous vegetables, mushrooms and truffles, other vegetables.
- **Fruits and nuts** include grapes, citrus fruits, nuts and other fruits. See table 7.11
- **Oilseed crops** include temporary oilseed crops(soybeans, groundnuts etc.) and permanent oilseed crops (olive, oil palm.) See table 7.7
- **Root/tuber crops** with high starch or inulin content include potato, sweet potato, yam, cocoyam, dasheen, tannia, cassava. See table 7.8
- **Beverage and spice crops** include coffee, tea, cocoa and spice crops. See table 7.6
- **Leguminous crops** include beans, broad beans, chick peas, cow peas. See FAO. 2005a.
- **Sugar crops** include sugarcane and sugar beet. See table 7.9
- **Other crops** include all crops not includes in above groups

Refer to *Indicative Crop Classification (ICC)*, [FAO 2005a] Statistical Development Series 11.

Fragmentation of holding

The number of isolated parcels of land gives an indicator of fragmentation of land belonging to the holding. This indicator is used for monitoring land consolidation policies.

Gross cropped area

Gross cropped area is the total area of all temporary crops cropped, counting as many times as the cultivation is done, as opposed to the physical area of land cropped. For example, if a crop is cultivated twice on the same plot of land the area under the crop will be double of the physical area of the plot. (Refer to table 7.1)

Kitchen gardens

Kitchen gardens are areas devoted to the cultivation of agricultural products intended for self-consumption by the holder's household. Only occasional surplus products coming from this area are sold off from the holding. The Kitchen garden area is normally separated off from the rest of the agricultural land, and is recognizable as kitchen gardens. All areas from which products are consistently sold on the market do not belong to this category, even if part of the production is consumed by the holder and his household. (Refer to Eurostat's concepts and definition database)

Land use

Land use refers to activities – such as growing crops, raising livestock or cultivating fish – carried out on the land making up the holding with the intention of obtaining products and/or benefits. Land use should be distinguished from "land cover", which describes the physical characteristics of the land, such as grassland or forest. In an agricultural census, the area of the holding is classified according to its main land use.

Land tenure

Land tenure refers to the arrangements or rights under which the holder holds or uses holding land. Land rented is not considered to be part of the holding. A holding may be operated under one or more form of tenure, with each parcel normally operated under one tenure form. Refer to [FAO 1995] Statistical Development Series 5.

CONCEPTS AND DEFINITIONS

Legal status of the holder

Legal status of the holders refers to the juridical aspects under which the agricultural holdings is operated. It also refers to other aspects about the type of holdings. From the juridical point of view, a holding may be operated by a single individual, jointly by several individuals with or without contractual agreement belonging to the same or to different households, or by a household as whole, or by a juridical person like corporation, cooperative, governmental institution, religious institution etc.

Laying hens

Chicken reared mainly for production of eggs.

Livestock classification

- **Large ruminants** include cattle, buffaloes, yaks, carabaos, bison and elks.
- **Small ruminants** include sheep and goats
- **Suidae** include pigs, wild boars.
- **Equines** include horses, mules, hinnies, asses, donkeys, zebras.
- **Camels and camelides** include camels, llamas, alpacas, vicuñas, guanacos.
- **Poultry** includes chickens, ducks, geese, turkeys, guinea fowls, pigeons.

Refer to table 8.1.

Livestock population

The livestock population refers to animal numbers present on the holding on the reference date regardless of ownership. Livestock population usually includes livestock temporarily absent or in transit at enumeration time. However, the counting conventions may differ from one country to another.

Occasional worker

An occasional worker is a person working one or more times during the agricultural year on the holding. Such a person is not expected to work regularly or continuously on the holding. (See permanent worker)

Parcel

A holding parcel is any piece of land entirely surrounded by other land, water, road, forest, etc. not forming part of the holding. A parcel may consist of one or more fields adjacent to each other.

Permanent crops

Permanent crops are crops with a more than one year growing cycle. Permanent crops may be grow in a compact plantation or as scattered trees/plants and both should be included.

Permanent meadows and pastures

Include land used permanently (for five years or more) to grow herbaceous forage crops, through managed cultivation or naturally (wild prairie or grazing land).

Permanent worker

A permanent worker is a person whose services are utilized regularly and continuously during the reference year for the agricultural work on the holding. Often, this is interpreted as working six months or more during the year. This approach is difficult to apply in practice, given the seasonality of agricultural work. A person may work regularly and continuously on a holding when work is available, but that may only be for a few months of the year. Alternatively, a person may work continuously but only for a few hours a week. In most censuses big holdings report their permanent salaried employees as permanent workers. (See occasional worker)

Plot

The plot is part or whole of a field on which a specific crop or crop mixture is grown.

Reporting countries

Refers to the countries reporting information to FAO on different items of the WCA round.

Scattered trees/plants

Plants and trees scattered around a holding and not following any pattern of plantation thus preventing the estimation of the area of land occupied by them.

Temporary crops

Temporary crops are those with a less than one year growing cycle. In the census some countries collect information for only the major crops. Total area of these crops may not be the true estimate of the total area under temporary crops. Some crops like sugar cane, are treated as temporary crop in some countries whereas in other countries it may be treated as permanent crops, depending upon the duration of the crop in the fields and the number of ratoonings before fresh plantation.

Total area of holdings

This indicator is based on total operated area of the holdings in a country. This should not be confused with "agricultural areas" which is subcategory of operated area of the holdings.

Agricultural land = cropland (land under temporary crops, meadows, and fallow land + land under permanent crops) + permanent meadows and pastures.(See table 1.3)

Utilized agricultural area

Is defined as including arable land, kitchen gardens, permanent meadows and pastures, and permanent crops (Eurostat definition).

The Programme for the 2000 World Census of Agriculture was the sixth prepared by FAO for encouraging countries to undertake an agricultural census with standardized international concepts, definitions and methodologies.

The programme covered the censuses carried out during the decade (1996 – 2005).

About 122 countries carried out an agriculture census during the decade and
114 countries made available their census reports to FAO
