# **ASSESSMENT OF TREE RESOURCES IN THE HOME GARDENS OF SRI LANKA**

**November 2002**

**EC-FAO PARTNERSHIP PROGRAMME  
(2000-2002)**

*The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Food and Agriculture Organization of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. The word "countries" appearing in the text refers to countries, territories and areas without distinction. The designations "developed" and "developing" countries are intended for statistical convenience and do not necessarily express a judgement about the stage reached by a particular country or area in the development process. The opinions expressed in the articles by contributing authors are not necessarily those of FAO.*

The EC-FAO Partnership Programme on *Information and Analysis for Sustainable Forest Management: Linking National and International Efforts in South Asia and Southeast Asia* is designed to enhance country capacities to collect and analyze relevant data, to disseminate up-to-date information on forestry and to make this information more readily available for strategic decision-making. Thirteen countries in South and Southeast Asia (Bangladesh, Bhutan, Cambodia, India, Indonesia, Lao P.D.R., Malaysia, Nepal, Pakistan, the Philippines, Sri Lanka, Thailand and Viet Nam) participate in the Programme. Operating under the guidance of the Asia-Pacific Forestry Commission (APFC) Working Group on Statistics and Information, the initiative is implemented by the Food and Agriculture Organization of the United Nations (FAO) in close partnership with experts from participating countries. It draws on experience gained from similar EC-FAO efforts in Africa, and the Caribbean and Latin America and is funded by the European Commission.

## Introduction

Sri Lanka is a densely populated island with a land area of about 6.5 million ha. Topographically, the country consists of highlands in the south central part of the island, which rise to about 2 500 m, and lowland plains elsewhere. The climate is tropical and maritime. The country is divided into three climatic zones (dry, intermediate and wet) based on annual rainfall. The natural vegetation varies according to the climatic zones. Tropical rain forests are found in the wet zone while submontane forests occupy the central highlands. Dry monsoon forest predominates in the dry zone. Logging in natural forests has been banned since 1990 and Sri Lanka meets its timber and fuelwood demands mainly from home gardens, rubber and coconut plantations and forest plantations (Bandaratillake 2001).

Sri Lanka is administered through nine provinces (Eastern, Western, Northern, Southern, Central, Uva, North Central, North Western and Sabaragamuwa) consisting of 25 districts (Figure 1). Each district is divided further into divisional secretariat divisions (DS divisions) that are subdivided into Grama Niladhari divisions (GN divisions), which are the smallest administrative units.

**Figure 1. Administrative districts of Sri Lanka**

**Figure 2. Forest cover of Sri Lanka**

The current National Forest Policy formulated in 1995 emphasizes the strict conservation of the remaining natural forests for soil and water conservation and biodiversity while increasing tree cover in other areas to meet the demand for forest products and services. Participatory management has been identified as the key approach to forest resource management.

The Forestry Sector Master Plan (FSMP 1995) outlines the strategies for the development of the forestry sector until 2020 and identified home gardens as the main source of timber and fuelwood. Several studies on the structure, species composition and economics of home gardens have been conducted in parts of the country (McConnell and Dharmapala 1973; Jacob and Alles 1987; Perera and Rajapakse 1991). The earlier studies were confined to the wet hills and lowland home gardens, better known as “Kandyan Forest Gardens”. A comprehensive assessment of the true

potential of home gardens to supply industrial timber and other forest products and services is lacking. An attempt to assess the tree resources in home gardens throughout the country was made in 1996 by the Ministry of Forestry and Environment. The survey was carried out by the Grama Niladaries (headmen) under the direction of the divisional secretaries. The collected data are available in tabular form. Unfortunately, the data were never analysed and therefore valuable information on trees in home gardens has not been disseminated. This report provides an analysis of the 1996 data.

## Tree resources in Sri Lanka

### Natural forests

In 1956, at the time of the first forest inventory, 44 percent of Sri Lanka was covered by forests. In 1992, the closed canopy forest cover had declined to about 24 percent. The total forest cover today, including sparse forests, is around 30.9 percent. Deforestation has been caused mainly by conversion to other land uses and shifting cultivation. The remaining forest cover of about two million ha consists mostly of dry monsoon, sparse and fragments of tropical rain forests (Table 1).

### Forest plantations

Forest plantation establishment commenced in the 1870s. Over the past 100 years the Forest Department has established nearly 93 000 ha of forest plantations mainly with teak, eucalyptus, pine and mahogany. The initial plantation establishment activities (from 1890 to 1950) focused on replacing the natural forest areas that had been lost owing to shifting cultivation. Most teak and mahogany plantations were established during this period under the Cooperative Reforestation System (modified *Taungya* system). The planting of pines and eucalypts in the wet zone and up-country was started in 1939 in line with the policy of planting *patana* grasslands, which are composed mainly of *Cymbopogon confertiflorius*, *Themeda tremula*, *Chrysopogon*, *Pollinia* and *Arundinelia* grasses.

This trend was continued until the policy change in 1953. The new policy emphasized the production of fuelwood and timber as the main role of forest plantations to alleviate the pressure on natural forests. As a result, large-scale plantations of teak and eucalyptus in the dry zone and pines in the wet zone were established until the 1980s.

Environmental and social aspects of plantation development were discussed widely and the importance of the participation of local people in tree growing was recognized during the mid-1980s. When the Community Forestry Project (CFP) started in 1982, the approach to tree growing changed somewhat. This project was funded by the Asian Development Bank (ADB) and implemented in five administrative districts (Badulla, Nuwara Eliya, Kandy, Matale and Batticaloa). The main objectives of the six-year project were to establish fuelwood plantations and community woodlots with the participation of local people. The project was followed by the Participatory Forestry Project (PFP), which was also funded by the ADB and implemented throughout the country between 1992 and 1999. The main components of the PFP were similar to those of the CFP but the earlier block fuelwood plantation component was not included. All the components were implemented with more participation by local communities. Both the CFP and PFP were implemented by the Forest Department.

The total area under productive forest plantations is around 93 000 ha to date (Table 2).

**Table 2. Forest plantations by species (hectares)**

Species	Extent
Conifers ( <i>Pinus</i> )	16 440
Eucalyptus and acacias	27 500
Teak	31 713
Mahogany	2 800
Miscellaneous	14 547
<b>Total</b>	<b>93 000</b>

### **Trees outside forest areas**

There are different types of tree resources outside the traditional forest areas. Home gardens, coconut plantations, rubber plantations, shade trees in tea plantations, roadside plantations, trees on farmlands and other perennial plantations provide more than 70 percent of the industrial timber and more than 80 percent of the biofuel demand.

### Home gardens

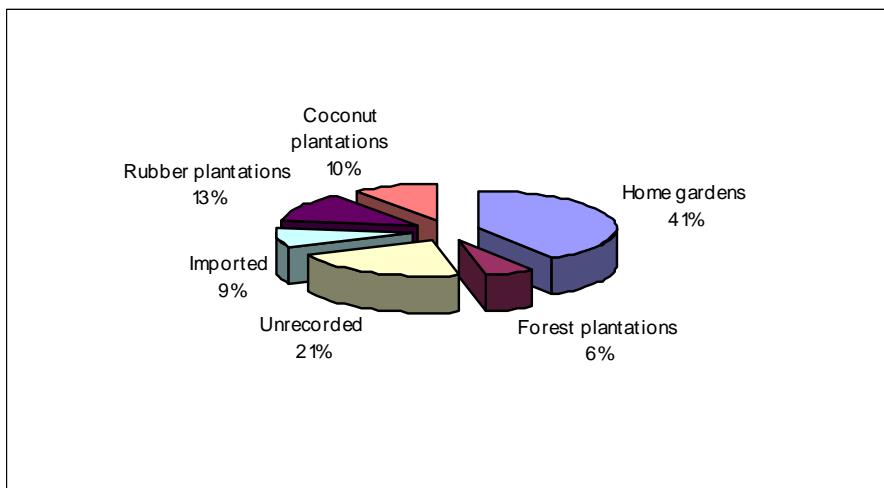

Home gardens are perhaps the best-developed agroforestry system in Sri Lanka. This system of perennial cropping has been practised for centuries. It is essentially mixed cropping with a variety of tree species that provide food, fruits, timber, medicine and spices. Home gardens are widespread and vary in species composition and tree density. According to FSMP estimates, home gardens covered about 858 000 ha in 1992. Their extent is increasing by about one percent annually.

Table 3 shows the distribution of home gardens by district based on Landsat TM data (Jewell 1995). The districts of the north (Jaffna, Kilinochchi, Mulativu, Mannar, and Vavunia) were not included in the study.

Home gardens in Sri Lanka produce 41 percent of national sawlogs and 26 percent of the biofuel demand (FSMP 1995) (Figures 3 and 4). The National Forest Policy of 1995 has recognized their important role by stating that “Trees growing on homesteads, and other agroforestry, will be promoted as a main strategy to supply wood and other forest products for meeting household and market needs”. According to the FSMP estimates, home gardens produce 0.95 m<sup>2</sup> of sawlogs and 0.5 m<sup>2</sup> of poles per hectare per year.

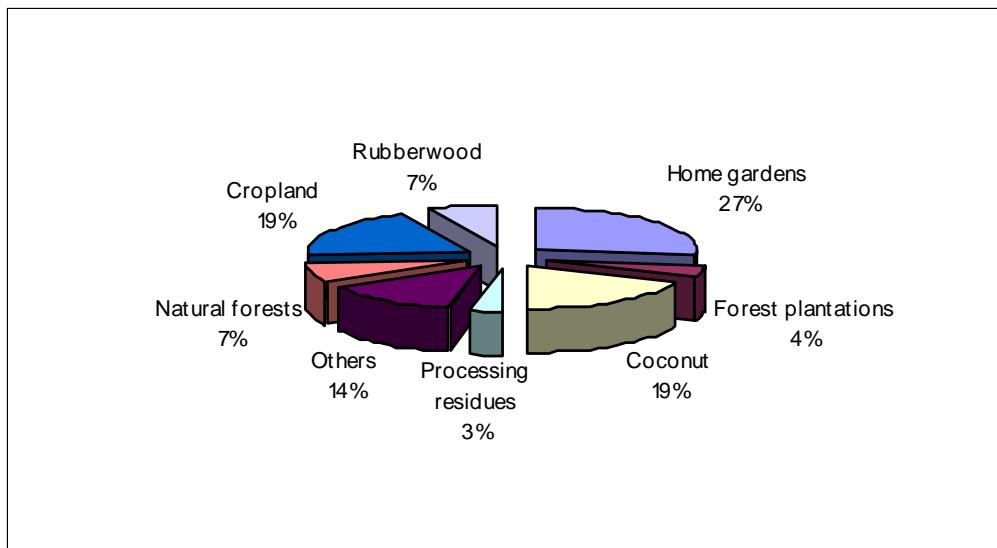

**Table 3. Distribution of home gardens in 1992 (hectares)**

District	Land area (ha)	Area of home gardens	Home gardens as % of districts

#### Rubber, coconut and tea

Rubber and coconut plantations supply 13 percent and 10 percent of the national sawlog demand respectively. There are about 158 000 ha of rubber plantations and 439 000 ha of coconut plantations. Nearly 30 percent of the rubber plantations are mature and could be used for timber. About 35 percent of the coconut stock is more than 50 years old and suitable for timber production. There are about 180 000 ha of tea plantations and shade trees in these plantations are often used for timber production.

Wood production from non-forest tree resources is highly significant in the Sri Lankan context. Table 4 shows the projected wood production from home gardens and other non-forest tree resources.

**Table 4. Projected wood production from home gardens and other non-forest tree resources ('000 m<sup>3</sup>)**

## **Assessment of tree resources in home gardens**

### **Study area**

This study was carried out in 22 administrative districts (out of a total of 25) covering 242 divisional secretary divisions (out of a total of 302). Details of the study area are given in Table 5 while Figure 5 shows the geographical coverage of the study.

**Table 5. Study area**

**Figure 5. Area covered by the study**

### **Methodology**

The study was conducted at GN division levels. There are about 13 970 GN divisions and data were collected in 12 267 GN divisions covering 87 percent of the country. Each household in the GN division was visited during the 1996 assessment. Trees grown in home gardens were classified in three categories based on their main uses: timber, timber and food, and food. Species were noted and classified according to two girth classes (below and above 30 cm girth). Data collected at the GN division level were compiled subsequently to DS division levels.

### **Data analysis**

The data available on tally sheets were entered manually into an MS Access database for further analysis. Three different tables were created within MS Access. The **Main** table holds raw data of the survey while the **Dsdiv** table contains data pertaining to the geographical and climatic details of the study area. The **Botname** table contains the local and botanical names, families and category of the species. The database structure is shown in Table 6.

**Table 6. Structure of the home garden database**

Table name	No. of records	Field name	Description
<b>Main</b>	9 568	District	Administrative district
		Srlno	Identification number of the DS division used in GIS
		Sppno	Identification number of the species
		Above 30	Number of trees in the DS division above 30 cm girth
		Below 30	Number of trees in the DS division below 30 cm girth
		Total	Total number of trees in both girth classes
<b>Dsdiv</b>	302	District	Administrative district
		Ds_div	Name of the DS division
		Srlno	Identification of the DS division used in the GIS
		Cli_zone	Climatic zone of the DS division (dry, intermediate, wet)
		Gnd	Number of GN divisions in the DS division
		Villages	Number of villages in the DS division
<b>Botname</b>	142	Sppno	Identification number of the species
		Lcl_name	Local name of the species
		Bot_name	Botanical name of the species
		Family	Family of the species
		Type	Category of the species (timber, timber & food, food)

The data pertaining to all the species, regardless of species frequency, were entered into the database for dry and intermediate zones while only the most common 41 species were entered into the database for the wet zone. The total number of species reported was 482 and only 76 species, based on the frequency of occurrence, were considered in the final analysis. They represented 46 timber species, 17 timber and food species, and 13 food species. Several tables and queries were used within MS Access for data analysis. The tables and queries were exported subsequently to MS Excel and DBF formats to generate maps, tables and charts.

A map of Sri Lanka was produced by digitizing the boundaries of the 25 administrative districts and 302 DS divisions to facilitate the spatial data analysis using the Map Maker Pro GIS package. The database was linked to the spatial data and several maps were produced to illustrate the climatic zones, species distribution and species density.

## Results and discussion

This study was carried out in 242 DS divisions covering 12 267 GN divisions, which represent 87 percent coverage of the country. The intensity of the survey was low in the northern and eastern districts owing to the prevailing security situation in this area. This explains the unusually low total tally of species in these districts.

### **Species composition**

More than 400 woody species are found in home gardens. Some species are planted while the balance regenerates naturally in home gardens. Almost all the species in the categories of food (F) and timber and food (TF) are planted while some of the timber (T) species, especially in the dry zone, regenerate naturally. Table 7 shows the origin and category for 76 species considered in this analysis in order of frequency of occurrence. The most common tree species recorded during this assessment are given in Appendix 1.

**Table 7. Most common home garden species in order of frequency of occurrence**

Local	Species name	Botanical	Origin	Category	Total number of trees
Coconut	<i>Cocos nucifera</i>	Planted	Timber & food	38 616 649

Cocoa	<i>Theobroma cacao</i>	Planted	Food	259 498	
Mora	<i>Dimocarpus longana</i>	Naturally grown	Timber & food	252 611	
Kenda	<i>Macaranga peltata</i>	Naturally grown	Timber	244 020	
Veralu	<i>Elaeocarpus serratus</i>	Naturally grown	Food	234 654	
Gansuriya	<i>Thespesia populnea</i>	Naturally grown	Timber	202 853	
Delum	<i>Punica granatum</i>	Planted	Food	197 941	

Kottamba	<i>Terminalia catappa</i>	Naturally grown/planted	Timber	186 665
Pihimbiya	<i>Filicium decipiens</i>	Naturally grown/planted	Timber	184 958
Bulu	<i>Terminalia bellirica</i>	Naturally grown/planted	Timber	180 690
Ebony	<i>Diospyros ebenum</i>	Naturally grown/planted	Timber	174 005
Godapara	<i>Dillenia retusa</i>	Naturally grown	Timber	171 937
Domba	<i>Calophyllum inophyllum</i>	Naturally grown	Timber	167 747
Beli	<i>Aegle marmelos</i>	Naturally grown/planted	Food	165 718
Kahata	<i>Careya arborea</i>	Naturally grown	Timber	165 294
Wewarana	<i>Alseodaphne semicarpifolia</i>	Naturally grown	Timber	162 881
Hik	<i>Lannea coromandelica</i>	Naturally grown	Timber	149 077
Ehela	<i>Cassia fistula</i>	Naturally grown	Timber	140 965
Hulanhik	<i>Chukrasia tabularis</i>	Naturally grown	Timber	131 500
Palmairah	<i>Borrassus flabellifer</i>	Naturally grown/planted	Timber & food	127 340
Nelli	<i>Phyllanthus emblica</i>	Naturally grown/planted	Food	116 728
Ambarella	<i>Spondias dulcis</i>	Planted	Food	86 200
Albizzia_2	<i>Albizia lebbeck</i>	Naturally grown	Timber	70 110
Gal siyambala	<i>Dialium ovoideum</i>	Naturally grown	Timber & food	57 304
Etamba	<i>Mangifera zeylanica</i>	Naturally grown	Timber & food	52 103
Coffee	<i>Coffea arabica</i>	Planted	Food	40 936

Apart from the three general uses of the species given in Table 7 some species are used widely in traditional medicine. Table 8 lists species, used in traditional medicine, which were selected from a list of 142 species found in home gardens.

**Table 8. Home garden species widely used in traditional medicine**

Local	Species name	Category	Origin
	Botanical		
Ahu	<i>Morinda citrifolia</i>	Timber	Naturally grown/planted
Ambarella	<i>Spondias dulcis</i>	Food	Planted
Aralu	<i>Terminalia chebula</i>	Timber & food	Naturally grown/planted
Attikka	<i>Ficus racemosa</i>	Timber	Planted
Bakini	<i>Nauclea orientalis</i>	Timber & food	Planted
Beli	<i>Aegle marmelos</i>	Food	Planted
Bulu	<i>Terminalia bellirica</i>	Timber	Naturally grown/planted
Delum	<i>Punica granatum</i>	Food	Planted
Domba	<i>Calophyllum inophyllum</i>	Timber	Naturally grown/planted
Ehela	<i>Cassia fistula</i>	Timber	Naturally grown/planted
Gammalu	<i>Pterocarpus marsupium</i>	Timber	Naturally grown/planted
Ingini	<i>Strychnos potatorum</i>	Timber	Naturally grown/planted
Kaduru	<i>Thevetia peruviana</i>	Timber	Naturally grown/planted
Kahata	<i>Careya arborea</i>	Timber	Naturally grown
Karapincha	<i>Murraya koenigii</i>	Food	Planted
Keena	<i>Calophyllum walkeri</i>	Timber	Naturally grown
Ketakela	<i>Bridelia retusa</i>	Timber	Naturally grown
Kirikon	<i>Walsura piscidia</i>	Timber	Naturally grown
Kitul	<i>Caryota urens</i>	Timber & food	Planted
Kolon	<i>Adina cordifolia</i>	Timber	Naturally grown
Kumbuk	<i>Terminalia arjuna</i>	Timber	Naturally grown/planted
Lime	<i>Citrus aurantifolia</i>	Food	Planted
Margosa	<i>Azadirachta indica</i>	Timber	Naturally grown/planted
Mee	<i>Madhuca longifolia</i>	Timber	Naturally grown/planted
Murunga	<i>Moringa oleifera</i>	Food	Planted
Nelli	<i>Phyllanthus emblica</i>	Food	Planted
Sadikka	<i>Myristica fragrans</i>	Food	Planted
Tamarind	<i>Tamarindus indica</i>	Timber & food	Planted
Wara	<i>Calotropis gigantea</i>	Timber	Naturally grown

The majority of tree species found in home gardens are indigenous or endemic with multi-purpose uses. However, recently more exotic species have been introduced, especially commercial timber species. Five of the top 10 species grown in home gardens are exotic timber species. These species, namely teak, mahogany, *Albizia molucana*, *Alstonia macrophylla* and eucalyptus, account for 15 percent of the total number of trees recorded in this assessment.

### ***Species distribution***

#### **Species distribution across the districts**

The highest number of species as well as the highest species density are found in the wet zone districts followed by the intermediate and dry zones. Species richness in the wet and intermediate zones can be attributed to favourable climatic conditions and the limited availability of land resources in these areas. Table 9 shows species distribution in the 23 administrative districts.

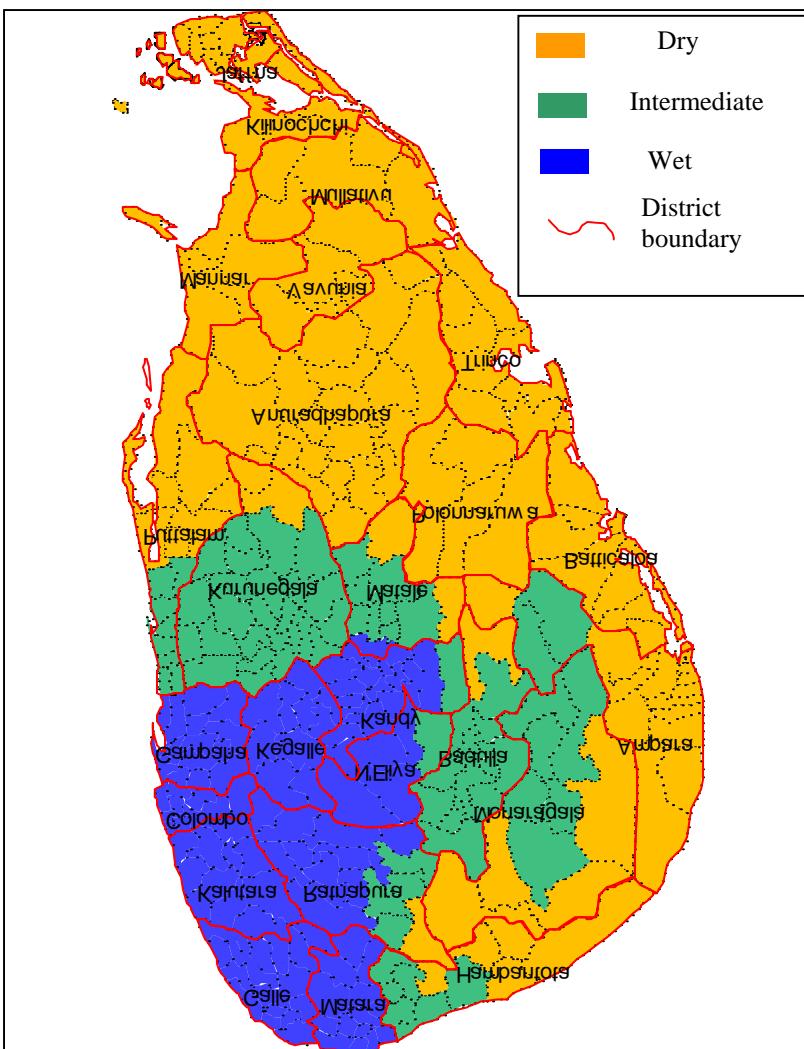

**Table 9. Distribution of species by district**

## Species distribution across the climatic zones

The wet zone receives an annual rainfall of over 2 500 mm while the intermediate zone, which lies between the dry and wet zones, receives an annual rainfall of 1 000 to 2 500 mm. The dry zone, which has a prolonged dry period of about eight months, has an annual rainfall of less than 1 000 mm. Natural vegetation has a distinct variation among these climatic zones; this is also common to the home gardens species. Figure 6 shows the climatic zones of Sri Lanka.

**Figure 6. Climatic zones of Sri Lanka**

Although the wet zone is significantly smaller in extent than the dry zone, the total number of trees recorded within the wet zone is much higher. Table 10 shows species distribution by climatic zone. Of the most common 25 species, in terms of frequency of occurrence, 21 are found in all three climatic zones.

**Table 10. Species distribution by climatic zones**

### Species distribution according to girth classes

Data were collected according to two different girth classes (below and above 30 cm girth). Most species have higher numbers of trees in the lower diameter class indicating the sustainable nature of home gardens. Notable differences are *Albizia molucana*, eucalyptus, *Gravilia robusta* and *Toona sinensis*, which exhibit bigger trees. The four species are exotics and were not grown traditionally in home gardens until recently. Using multi-purpose tree species for smaller-diameter timber is not common as they are grown primarily for other products (e.g. coconut, rubber, jak and mango). Exotic timber species, on the other hand, are used for poles and small-diameter timber as and when required. This may explain to some extent the lower number of smaller diameter trees of exotic species.

The girth classes for coconut are of little use as an indicator of sustainable management, as coconuts have a girth exceeding 30 cm at all stages of growth. Small-scale rubber planting in home gardens and adjoining areas declined over the years owing to the uncertainty of rubber prices. Many former rubber areas have been converted to tea and cinnamon in the recent past. The lower number of small-diameter rubber trees is probably attributable to the decline in interest in rubber. Table 11 shows the total number of trees in each girth class.

### Species density

The total number of trees reported in the survey was used to calculate the district base species density in home gardens. Unusually low densities appear in the northern and eastern administrative districts due to the partial coverage of the area. Although there are some variations, the average density is about 200 trees per hectare. Tree density is highest in the wet zone districts followed by the intermediate and dry zones (Table 12).

**Table 12. Tree density in different districts and climatic zones**

District	Land area (ha)	Area of home gardens (ha)	Home gardens%	Total no. of trees	Tree density/ha	Population	Climatic zone
Kegalle	168 328	46 782	27.8	22 226 316	475	779 000	Wet

TOTAL/AVG	5 714 713	818 394	14.3	161 418 764	197	
-----------	-----------	---------	------	-------------	-----	--

\* The entire area is not covered by the study for security reasons

Galle and Matara are adjoining districts and were administered as one forest division at the time of the assessment. The average tree density in the dry zone is around 125 trees per hectare. More than 260 trees per hectare are found in the wet zone. Tree density in Kandy is unusually low despite the fact that the well-known Kandyan Forest Gardens are found in this area. Polonnaruwa is the other district with very low density. These differences cannot be explained with the available data.

Most home garden tree species are well distributed over the country and are found in all three climatic zones (Table 13). Geographical distribution and the tree density of the most common home garden species are shown in Appendix 2.

The 11 most valuable timber species can be found in more than 60 percent of the study area. Wood is used for all kinds of construction purposes, furniture and handicrafts. Table 14 shows the market prices of logs and timber classes of the most valuable home garden tree species. These are the prevailing log prices and timber classes of the State Timber Corporation (STC) and tend to change with market demand. Open market prices are somewhat higher than the STC prices.

**Table 14. Most valuable timber species found in home gardens**

Species name		Origin	Timber class	Log price/m <sup>3</sup> (Rs.)
Local	Botanical			
Teak	<i>Tectona grandis</i>	Planted	Super luxury	23 040
Nedun	<i>Pericopsis mooniana</i>	Naturally grown/planted	Super luxury	23 040
Jak	<i>Artocarpus heterophyllus</i>	Planted	Luxury	15 120
Mahogany	<i>Swietenia macrophylla</i>	Planted	Luxury	14 760
Satin	<i>Chloroxylon swietenia</i>	Naturally grown	Luxury	15 180
Halmilla	<i>Berrya cordifolia</i>	Naturally grown/planted	Luxury	15 180
Milla	<i>Vitex altissima</i>	Naturally grown	Luxury	15 180
Eucalyptus	<i>Eucalyptus spp.</i>	Planted	Special & 2	5 700
Margosa	<i>Azadirachta indica</i>	Naturally grown/planted	Special	14 220
Kumbuk	<i>Terminalia arjuna</i>	Naturally grown/planted	Special	11 340

Palu	<i>Manilkara hexandra</i>	Naturally grown	Special	14 220
Welang	<i>Pterospermum suberifolium</i>	Naturally grown	Special	14 220
Kolon	<i>Adina cordifolia</i>	Naturally grown	Special	14 220
Suriyamara	<i>Albizia odoratissima</i>	Naturally grown	Special	14 220
Hora	<i>Dipterocarpus zeylanicus</i>	Naturally grown/planted	1	7 740
Ketakela	<i>Bridelia retusa</i>	Naturally grown	1	7 740
Kon	<i>Schleichera oleosa</i>	Naturally grown	1	7 740
Damba	<i>Syzygium assimile</i>	Naturally grown	1	7 740
Helamba	<i>Mitragyna parvifolia</i>	Naturally grown	1	7 740
Alstonia	<i>Alstonia macrophylla</i>	Planted	2	5 700
Toona	<i>Toona sinensis</i>	Naturally grown/planted	2	5 700
Coconut	<i>Cocos nucifera</i>	Planted	3	3 216
Rubber	<i>Hevea brasiliensis</i>	Planted	3	3 216
Mango	<i>Mangifera indica</i>	Planted	3	1 620
Albizia_1	<i>Albizia molucana</i>	Planted	3	1 620
Lunumidella	<i>Melia dubia</i>	Naturally grown/planted	3	3 180
Sabukku	<i>Grevillea robusta</i>	Naturally grown/planted	3	3 180
Rambutan	<i>Nephelium lappaceum</i>	Planted	3	1 620
Daminiya	<i>Grewia damine</i>	Naturally grown	3	1 620
Tamarind	<i>Tamarindus indica</i>	Naturally grown/planted	3	1 620

### **Timber production potential**

The contribution of home gardens to timber production is well known. The findings of this study can be used to obtain a tentative estimate of the timber production potential of home gardens in different climatic zones. Of the 76 species considered in this analysis, 61 species are capable of producing industrial timber. Species with above one million individuals and capable of producing industrial timber are shown in Table 15. There are 17 such species, which represent 83 percent of the total number of trees recorded during the survey.

The earlier FSMP studies indicated that one hectare of home gardens would produce 0.95 m<sup>3</sup> of sawlogs and 0.5 m<sup>3</sup> of poles per year. According to this estimate poles account for 34 percent of the total volume production. Multi-purpose tree species (e.g. jak, coconut, rubber and mango) are rarely used for poles and small-diameter timber. The bulk of poles and small-diameter timber is produced from other species, especially exotics (e.g. alstonia, eucalyptus, mahogany). The potential timber production has been calculated for each species taking into account the above facts (Table 15). In addition, it is assumed that only 40 to 70 percent of the total number of trees, depending on the species, reaches maturity to produce sawlogs. Average values have been used for the rotation age and timber volume of individual trees (volume over bark).

**Table 15. Estimated sawlog production**

Species name		Category	Total no. of trees	Estimated no. of trees that would reach maturity	Rotation age (years)	Timber volume per tree (m <sup>3</sup> )	Estimated timber volume (m <sup>3</sup> )
Local	Botanical						
Coconut	<i>Cocos nucifera</i>	Timber & food	38 616 649	27 031 654	50	0.15	81 095
Rubber	<i>Hevea brasiliensis</i>	Timber	17 101 488	10 260 893	30	0.3	102 609
Jak	<i>Artocarpus heterophyllus</i>	Timber & food	10 437 142	8 349 714	40	0.5	104 371
Mahogany	<i>Swietenia macrophylla</i>	Timber	6 410 248	2 564 099	30	0.6	51 282
Alstonia	<i>Alstonia macrophylla</i>	Timber	5 968 286	2 387 314	25	0.3	28 648
Mango	<i>Mangifera indica</i>	Timber & food	5 607 688	3 925 382	40	0.4	39 254
Albizia_1	<i>Albizia molucana</i>	Timber	5 607 581	2 243 032	25	0.4	35 889
Eucalyptus	<i>Eucalyptus spp.</i>	Timber	4 061 191	1 624 476	25	0.6	38 987
Teak	<i>Tectona grandis</i>	Timber	3 293 609	1 317 444	35	0.6	22 585
Margosa	<i>Azadirachta indica</i>	Timber	3 044 932	2 131 452	45	0.4	18 946
Lunumidella	<i>Melia dubia</i>	Timber	2 349 245	1 409 547	25	0.4	22 553
Kitul	<i>Caryota urens</i>	Timber & food	1 751 016	1 225 711	35	0.15	5 253
Satin	<i>Chloroxylon swietenia</i>	Timber	1 489 903	1 042 932	70	0.4	5 960
Sabukku	<i>Grevillea robusta</i>	Timber	1 460 721	584 288	30	0.35	6 817

Halmilla	<i>Berrya cordifolia</i>	Timber	1 185 466	829 826	40	0.4	8 298
Rambutan	<i>Nephelium lappaceum</i>	Timber & food	1 177 920	824 544	40	0.4	8 245
Toona	<i>Toona sinensis</i>	Timber	1 023 771	511 886	25	0.4	8 190
Daminiya	<i>Grewia damine</i>	Timber	1 001 625	600 975	40	0.4	6 010
<b>Total</b>							<b>594 992</b>

Five exotic timber species (mahogany, alstonia, albizzia, eucalyptus and teak), which are later additions to the species mix of home gardens, account for 30 percent of the total timber volume produced in home gardens. Rubber alone would produce about 17 percent of the timber volume while three main multi-purpose tree species traditionally grown in home gardens (coconut, jak, and mango) would produce 38 percent of the timber volume.

The FSMP estimated the production potential of home gardens as 0.583 million m<sup>3</sup> of sawlogs in 2000 (Table 4). The estimated volume using the data in this survey is 0.594 million m<sup>3</sup>. This is about 25 percent higher than the FSMP estimates considering that the study has covered only 87 percent of the country and the volume has been calculated only for 83 percent of the species found in home gardens.

## Conclusions

Home gardens in Sri Lanka offer a highly diversified and economically viable form of land use. They produce a variety of products such as food, fruits, medicine, spices, fuelwood and timber.

There are more than 300 different woody species in home gardens and 120 of these species are common. Traditionally, coconut, jak and mango were common species. In the recent past, species composition has changed with the inclusion of commercially valuable exotic timber species such as teak, mahogany, alstonia, albizzia and eucalyptus. These five species are among the top 10 species in the order of frequency of occurrence and account for 15 percent of the total number of trees recorded in the assessment. They produce over 40 percent of the total timber volume.

The most important tree species found in home gardens in terms of producing food and timber are well distributed across the climatic zones. Twenty-two such species are distributed in excess of 50 percent of the land area. The majority of tree species, especially the ones that are grown traditionally, has more trees in lower diameter classes showing the sustainable nature of home gardens.

A conservative estimate shows that home gardens are capable of producing over 1.3 million m<sup>3</sup> of industrial timber and fuelwood, which represents 41 percent of the national demand for industrial timber and 26 percent of the biofuel demand.

The findings of this assessment provide the basis for reviewing the current restrictions on the transport of certain timber species. The data on availability and distribution of different species in geographical areas could be used to devise an effective system to facilitate timber transport.

The assessment shows trends rather than accurate figures due to the nature and intensity of data collection. The findings, however, provide the basis for more accurate assessments especially with the use of current technology such as satellite image interpretation.
