Global Forest Resources Assessment 2020

Report

Faroe Islands

Rome, 2020

FAO has been monitoring the world's forests at 5 to 10 year intervals since 1946. The Global Forest Resources Assessments (FRA) are now produced every five years in an attempt to provide a consistent approach to describing the world's forests and how they are changing. The FRA is a country-driven process and the assessments are based on reports prepared by officially nominated National Correspondents. If a report is not available, the FRA Secretariat prepares a desk study using earlier reports, existing information and/or remote sensing based analysis.

This document was generated automatically using the report made available as a contribution to the FAO Global Forest Resources Assessment 2020, and submitted to FAO as an official government document. The content and the views expressed in this report are the responsibility of the entity submitting the report to FAO. FAO cannot be held responsible for any use made of the information contained in this document.

TABLE OF CONTENTS

Introduction

1. Forest extent, characteristics and changes

National classification and definitions

FAO FRA classes:

Category	Definition
Forest	Land spanning more than 0.5 hectares with trees higher than 5 meters and a canopy cover of more than 10 percent or trees able to reach these thresholds in situ. It does not include land that is predominantly under agricultural or urban land use.
Other wooded land	Land not classified as "Forest" spanning more than 0.5 hectares with trees higher than 5 meters and a canopy cover of 5-10 percent or trees able to reach these thresholds ; or with a combined cover of shrubs bushes and trees above 10 percent. It does not include land that is predominantly under agricultural or urban land use.
Other land	All land that is not classified as "Forest" or "Other wooded land".
...of which with tree cover (sub-category)	Land considered as "Other land", that is predominantly agricultural or urban lands use and has patches of tree cover that span more than 0.5 hectares with a canopy cover of more than 10 percent of trees able to reach a height of 5 meters at maturity. It includes bothe forest and non-forest tree species.
Inland water bodies	Inland water bodies generally include major rivers, lakes and water reservoirs.
Forest expansion	Expansion of forest on land that, until then, was not defined as forest.
...of which afforestation (sub-category)	Establishment of forest through planting and/or deliberate seeding on land that, until then, was not defined as forest.
...of which natural expansion of forest (subcategory)	Expansion of forests through natural succession on land that, until then, was under another land use (e.g. forest succession on land previously used for agriculture).
Deforestation	The conversion of forest to other land use or the longterm reduction of the tree canopy cover below the minimum 10 percent threshold.
...of which human induced (sub-category)	Human induced conversion of forest to other land use or the permanent reduction of the tree canopy cover below the minimum 10 percent threshold.
Reforestation	Natural regeneration or re-establishment of forest through planting and/or deliberate seeding on land already in forest land use.
...of which artificial reforestation (subcategory)	Re-establishment of forest through planting and/or deliberate seeding on land already in forest land use.

Original data

Forest reserves of mainly plantations cover 83 hectares.

Beside these plantations are a number of minor planted woodland areas for recreational purposes and under public or private ownership.

Remnants of the original woodland vegetation, consisting of *Juniperus communis* and *Salix spp* ., are also to be found. The largest areas with this *J. communis* is found on the island

Svínoy and with *S. phylicifolia* on the river bank by Hvalvík/Streymnes. *Betula pubescens* was extinct from the Faeroe Islands in the Viking age, Malmros (1994).

The total area of these two latter categories is not known, but is expected to be approx. 17 hectares.

Hereby the total forest area on the Faeroe Islands including forest reserves, original forest and small plantations and other wooded areas amounts to approx. 100 hectares.

There are no data on Other wooded land and the category may not be relevant for the Faeroe Islands.

Analysis and processing of national data

Estimation and forecasting

There is no basis for any forecasting other than repeating the current values. Furthermore, no significant changes are expected to occur in the next few years.

Reclassification into FRA 2020 categories

No reclassification was done
