International Treaty
on Plant Genetic Resources
for Food and Agriculture

Welcome to the *Journey of Seeds*

We invite you to **follow the seeds** on the floor to embark on a little **journey of seeds** – from farmers' fields to genebanks to farms, and from there to markets and into our kitchens.

This journey will take you through the **atrium and the flag room** through different spaces and different places around the world.

Safeguarding our future is only possible by safeguarding all life forms on our planet, and that includes seeds.

Seeds are central to the biodiversity that is **life on earth**.

And **biodiversity** is fundamental to human existence and planetary health.

Seeds open the way to **innovative solutions** for future **food security**.

Explore the potential of seeds for transformative solutions, in the careful hands of **farmers**, researchers, plant breeders and others involved in producing our food.

The **International Treaty on Plant Genetic Resources for Food and Agriculture** is the leading international body whose primary purpose is to save (conserve) and share the world's crops and forages, and ensure that these plants continue to exist, providing food and nutrition for all, now and in the future.

The International Treaty works with farmers, plant breeders and policy-makers around the world to **save, share and take care of the seeds of plants that feed the us all**.
