ABSTRACT

This paper is an update of a recent FAO study published in 2004. It presents information about the contribution of the forestry sector to national economies at the global, regional and country levels. The paper provides figures for total employment, value-added (1990-2006) and export earnings (1990-2007) in the sector, as well as information about trends in productivity. The figures include a mixture of statistics taken from published official sources and FAO estimates. Unfortunately, statistics are not available for many countries or for activities in the informal sector, so these figures must be treated with some caution. However, the figures probably give a reasonable indication of the importance of the sector at the global and regional level and highlight broad changes over time. They also show some of the main differences and changes in the structure of the sector between different countries and regions.

ACKNOWLEDGEMENTS

The figures presented here were collected from the databases and libraries located at FAO Headquarters in Rome and online sources. A number of FAO staff and experts in countries and other international organizations helped by supplying and checking some of the statistics (Martti Aarne, Finland; Matthias Dieter, Johannes-Gustav Küppers and Emanuel Myer, Germany; Alex McCusker, Roman Michalak, UN Economic Commission for Europe). The author expresses his appreciation to Mr Francesco Chiofalo (FAO Statistics Information and Resources Centre) for his assistance with data collection, and to FAO Forestry Department staff: Ms Susy Tafuro for editing and layout, Mr C.T.S Nair and Mr Adrian Whiteman for the technical supervision of this work.

EXECUTIVE SUMMARY

The contribution of the forestry sector to national economies is one dimension of sustainable forest management and information about this is needed to monitor progress in this respect. The Food and Agriculture Organization of the United Nations (FAO) is frequently asked for this information, so this study was commissioned to provide updated information about this topic. The work involved three main activities: the collection of statistics from published national and international sources; the estimation of missing data points (in order to complete the dataset so that regional and global totals could be produced); and analysis of the dataset.

The study covers the following three economic indicators: employment in the sector; value-added (i.e. the forestry sector's contribution to GDP); and the value of forest products exports and imports (i.e. the sector's contribution to trade balances). The objectives of the study were to produce a consistent and comparable dataset on forestry sector employment, value-added and the value of trade for every country and territory in the World, to examine the quality and amount of published data on this subject and to describe and comment on the trends in these indicators. The database that was produced can be freely obtained from FAO (e-mail: arvydas.lebedys@fao.org or adrian.whiteman@fao.org).

In spite of improved data availability in recent years, two major limitations remain in relation to collected statistics. First, many countries do not publish statistics about employment and value-added in the forestry sector or, where they do, they are often not in sufficient detail. A second problem is that informal forestry sector activities (e.g. production of woodfuel and non-wood forest products) are often not recorded in official statistics and, where they are, the measurement of employment and value-added in these activities may not be very reliable.

It was decided in this study to deliberately exclude all informal forestry sector activities from the analysis. In many developing countries, these activities are significant, so it is very important to note that this study presents information about the economic contribution of the “visible” or “formal” forestry sector. Therefore, the following figures are an underestimate of the total contribution of the sector to national economies.

Availability and quality of data

Detailed statistics on the total value of forest products trade were available for almost all countries and territories over the period 1990 to 2007. This is because FAO collects this information from countries every year.

For updating the databases on employment and value-added used in the previous FAO study (2004a), three main databases were consulted:

- The Industrial Statistics Database of the United Nations Industrial Development Organization (UNIDO). This includes statistics about employment and value-added in the wood industry and pulp and paper industry, but it does not cover forestry activities.
- LABORSTA database of the International Labour Organization (ILO) on paid employment in manufacturing. This includes employment statistics for wood industry, pulp and paper industry.

- The National Accounts Statistics compiled each year by the United Nations (UN). These include statistics on value-added for every country in the World, but they often do not go into sufficient detail to identify forestry sector activities.

In addition to these sources, information on employment and value-added was collected from national statistical reports (on forestry and national income accounts) and from other statistical studies commissioned by FAO.

Official statistics on employment in forestry were obtained for 49 countries each year (on average). For the wood industry and pulp and paper industry, official statistics were obtained for 109 and 106 countries respectively (on average each year). Official statistics on value-added in forestry activities were obtained for 111 countries each year (on average). For the wood industry and pulp and paper industry, official statistics were obtained for 97 and 92 countries respectively (on average each year).

As might be expected, at the regional level, the availability of statistics was generally better for developed regions (i.e. Northern America, Western Europe and the Developed Asia-Pacific region) than for developing regions. In addition, the availability of value-added statistics was slightly better than the availability of employment statistics (particularly in developing regions). It was difficult to assess the quality of the available statistics, but one issue that was identified was the problem of measuring employment numbers. It is suspected that many countries do not convert employment statistics to full-time equivalents. As already noted above, the main problem with the available statistics is that most published statistics probably do not include informal activities in the sector.

Although the absolute number of countries where statistics could be obtained is quite low, it should be noted that these countries account for the majority of the global forest area and production of forest products (i.e. over 90 percent). For countries where official statistics were not available (mostly developing countries) a variety of techniques were used to estimate missing data points from what little data was available. The figures presented here probably give a reasonable indication of the employment, value-added and international trade in the forestry sector at the global and regional levels, but the presence of many FAO estimates at the country level should be noted and these figures should be treated with caution.

Main results

Employment. Total employment in the (formal) forestry sector increased by about 15 percent over the last 15 years, from 15.7 million in 1990 to 13.7 million in 2006. At the global level, employment is divided roughly equally between forestry activities, the wood industry and the pulp and paper industry. However, at the regional level, forestry activities are relatively more important than processing activities in developing regions.

Labour productivity (i.e. the amount of output per employee) increased by about 40 percent over the last 15 years and remains higher in developed regions than in developing regions. Furthermore, labour productivity has increased in all three sub-sectors and in most regions.

At the global level, the forestry sector currently employs about 0.4 percent of the total labour force and this figure has fallen during the period 1990 to 2006. The contribution of the forestry sector to total employment is generally higher in the developed regions and Eastern

Europe than in developing regions. This is largely due to the significant numbers of people employed in the processing sector.

Value-added. Total gross value-added in the (formal) forestry sector has not changed much during the period 1990 to 2006, with an average value of USD 438 billion per year (in real terms) and annual figures within +/- five percent of this average. In 2006, total gross value-added in the forestry sector amounted to USD 468 billion.

Among the three sub-sectors, the pulp and paper industry makes the largest contribution to GDP, accounting for almost half of the total gross value-added in the forestry sector. The wood industry is the next largest contributor, with a 30 percent share of the total, while forestry activities account for the remaining 25 percent of gross value-added in the forestry sector. This distribution of the value-added across sub-sectors remained stable in the 1990s but the share of the pulp and paper industry has been declining in recent years.

At the regional level, the majority of global value-added in the forestry sector occurs in the three developed regions. This is largely due to the high levels of value-added achieved in the forest processing sectors in these regions (i.e. these three regions accounted for about 70 percent of the global value-added in the wood industry and the pulp and paper industry in 2006). However, these shares have fallen in recent years, as value-added in the forestry sector has increased in the Latin America and the Caribbean and Developing Asia-Pacific regions.

Value-added per unit of output has generally increased or remained about the same in the forestry and wood industry sub-sectors, but has declined in the pulp and paper industry (due to falling real products prices). The major exceptions to this are Western Europe and the Developed Asia-Pacific regions, where value-added per unit of output has declined in the forestry and wood industry sub-sectors, due to increased competition from neighbouring regions.

Value-added per unit of output in the forestry sub-sector is lower in developed regions than in developing regions (due to lower average roundwood prices). In general, the reverse is true in the processing sectors. However, the value-added per employee is far higher in developed regions than in developing regions in all sub-sectors.

During the 15 years, the contribution of the forestry sector to GDP has declined from just under 1.4 percent in 1990 to just over 1.0 percent in 2006. This decline has occurred because the global economy has expanded (i.e. global GDP has increased by 60 percent over the period) while value-added in the forestry sector has increased by only 10 percent. At the regional level, all regions display this downward trend.

Trade. The real value of forest products exports rose by nearly 100 percent over the period to reach a level of USD 330 billion in 2007. Furthermore, international trade in forest products has generally expanded at similar rates in both developed and developing countries.

At the regional level, exports of forest products are dominated by the three developed regions. For example, in 2007, Western Europe and Northern America together accounted for about 65 percent of global forest products exports, followed by the Developing Asia-Pacific region (with a 15 percent share) and Eastern Europe (with 10 percent share). Furthermore, most international trade in forest products is either trade between these three regions or between countries within each of these regions.

Despite the rapid growth in international trade, the growth in forest products trade has been less than the growth of trade in other merchandise goods. Therefore, the share of forest products in total merchandise exports declined from 3.5 percent in 1990 to 2.4 percent in 2007. This downward trend also appears in all regions except Latin America and the Caribbean.

Conclusions

The analysis of the trends in employment, value-added and trade show some interesting and important differences between regions in terms of their levels of development in the forestry sector.

First, in Sub-Saharan Africa, there have been some improvements in the sector, with increased employment, value-added and exports from the sector over the 1990s. However, after 2000 employment and exports declined and only value-added continued to grow in this region. One country - South Africa - accounts for a large proportion of these improvements. Generally, the forestry sector in Africa does not perform well compared with other regions. For example, Sub-Saharan Africa accounts for about 16 percent of the global forest area, but only two to three percent of global value-added and exports. Furthermore, the level of value-added and exports per employee is well below the global average. The structure of the forestry sector in Africa (i.e. the predominance of forestry activities compared to forest processing activities) suggests that Africa still suffers from a significant lack of industrialisation and general development, due to a variety of political, economic and structural problems. Addressing these problems is likely to remain a concern for policymakers in this region for many years to come.

At the other end of the scale, the three developed regions (Northern America, Western Europe and the Developed Asia-Pacific region) account for about 25 percent of global employment and the majority (about 65 percent) of global value-added and forest products exports. As would be expected, for almost all measures of productivity (e.g. production, value-added or exports per m³/tonne, per hectare of forest or per employee), the forestry sector in these three regions performs at a level that is well above the global average.

However, it is interesting to note that, in terms of the trends in these figures, only exports have grown in all three regions (and they fell after 2000 in Northern America). Employment is declining continuously, largely due to the substitution of capital for labour. The disturbing trend is that value-added is shrinking in Northern America, Japan and most countries in Western Europe. This is due to increasing competition in neighbouring regions, which may cause some structural changes and changes in trade flows in the future. Policymakers and the forest industry in these countries would be well advised to reassess their competitive strengths and advantages in view of the historical changes in these figures and the likely changes in the future.

Eastern Europe presents a very interesting situation that has arisen due to the profound social, political and economic changes that have taken place in this region during the 1990s. Forestry sector employment has fallen, but is still relatively high given the overall size of the forestry sector in this region. Exports are significant and have increased dramatically over the last 15 years. The main problem in this region is that the level of value-added in the sector is

comparatively low and has fallen significantly during the past decade (although it has started to rise again in recent years).

A comparison of the figures for employment, value-added and trade suggest that there is substantial potential for development of the forestry sector in this region. However, there is also a significant need for investment in new technology, improved marketing and an upgrading of human resources. The challenge for policymakers and the forest industry in this region will be to assess whether to follow the development model of the developed regions (i.e. substituting capital for labour) or to pursue expansion of the sector on all fronts.

Latin America and the Caribbean and the Developing Asia-Pacific region are the two regions where the forestry sector has expanded on all fronts. In these two regions, forestry sector employment, value-added and trade have all expanded significantly over the last 15 years. This expansion has been driven by many factors, including: an abundance of cheap skilled labour; relatively abundant forest resources; a high rate of economic growth; specific policies to encourage development and investment in the sector; and more general improvements in the investment climate.

Many of these countries have made the transition from having a forestry sector that is largely focused on the production of roundwood and simple processed products to one where a diversified range of products are produced and marketed at a global scale. The measures of productivity in these countries are constantly improving are certainly higher than the average for all developing countries. The challenge for these countries will be to maintain this momentum while, at the same time, reducing the pressure on their forest resources. Already, many countries have started to do this with significant forest plantation programmes to guarantee future wood supplies.

Lastly, the figures show that the forestry sector in North Africa, Western and Central Asia accounts for only a small fraction of global employment, value-added and exports. Negligible forest resources limit the development of the whole sector and most of demand is met through imports. It seems likely that the development of secondary processing and paper industry may partly reduce the growing dependence on imports of forest products in this region.

A final general observation from this analysis is that value-added in the forestry sector has not increased rapidly except in a few countries where development of the sector has been of specific national development priority. Very few countries have focused on the development of the forestry sector, preferring instead to promote the development of other sectors. Thus, it is generally the case that the forestry sector has been left behind, particularly in rapidly growing economies. Furthermore, this suggests that the forestry sector is not a major driving force for economic growth and development except in specific circumstances.

The above comments are generalised and there are many differences between countries in each of the regions. The detailed tables presented in Annex show how important the forestry sector is in many relatively small countries. It is hoped that the detailed figures and references presented in Annex 2 can be used as a starting point for more in-depth analyses of forestry sector developments at the level of individual countries. Also, further work on the contribution of informal forestry sector activities would give a better and more balanced picture of the importance of the sector at the global, regional and country level.

INTRODUCTION

The contribution of the forestry sector to national economies is one dimension of sustainable forest management¹ and information about this is needed to monitor progress in this respect. In countries and regions where the contribution to national economies is high, this information can be used to gain the attention of important policy makers. It can also be used to respond to the general perception that the sector is relatively unimportant and to highlight the contribution of the sector to poverty alleviation.

The Food and Agriculture Organization of the United Nations (FAO) is frequently asked for information about the economic importance of the forestry sector by policy makers and others with an interest in the sector. Previous work on this subject at the global level was published four years ago (FAO, 2004a) and that study gained recognition and was widely quoted.

Because of the interest in this subject and significant changes taking place in the forestry sector since 2000, it was decided to update the previous study using the same methodology. The work on this study was started in mid-2008 and completed by end-2008. The work involved three main activities: the collection and collation of statistics from published national and international sources; the estimation of missing data points (in order to complete the dataset so that regional and global totals could be produced); and analysis of the dataset.

Scope and objectives of the study

The scope of this study covers the following three economic indicators: employment in the sector; value-added (i.e. the forestry sector's contribution to GDP); and the value of forest products exports and imports (i.e. the sector's contribution to trade balances).

The scope of the “forestry sector” was defined as including the following sub-sectors: forestry (ISIC Division 02), wood industry (ISIC Division 20) and the pulp and paper industry (ISIC Division 21).² The detailed definition of each of these sub-sectors is broadly comparable to the production and trade statistics compiled each year by FAO and presented in the FAOSTAT database (<http://faostat.fao.org>).

In addition, statistics for the furniture industry (ISIC Class 3610) were also collected, although they have not been included in the total for the forestry sector and no effort was made to estimate missing data points in this part of the dataset.

The objectives of the study were to update a consistent and comparable dataset on forestry sector employment, value-added and the value of trade for every country and territory in the World, to examine the quality and amount of published data on this subject and to describe and comment on the trends in these indicators.

¹ For example, economic indicators are one component of criteria and indicators for sustainable forest management.

² In most national statistics, economic activities are divided into different sectors and sub-sectors (e.g. agriculture, forestry, fishing, mining, construction, etc.). The International Standard Industrial Classification (ISIC) is a classification system that is used to ensure comparability between different countries and was the classification system used as the basis for most of this analysis.

The dataset covers all of the major countries and territories in the World and presents data for every year from 1990 to 2006 (2007 for export and import). This data has been stored in a computer database, which may be improved and updated. The database can be freely obtained from FAO (e-mail: arvydas.lebedys@fao.org or adrian.whiteman@fao.org).

Limitations of the study

The compilation of the dataset revealed a number of constraints and limitations, mostly related to the quality and availability of published statistics (especially from developing countries). For example, no published statistics were available at all for several countries and estimates had to be produced for the whole of the period 1990 to 2006.

The methodology used to produce these estimates is explained in the next section of this report and it is believed that the regional and global totals probably give a reasonable indication of the true magnitude of the indicators at this scale. However, at the level of individual countries, the presence of FAO estimates (rather than published statistics) should be noted and these estimates should be treated with caution.

Another limitation examined in the report is the problem of underestimation, especially with respect to the generation of employment and value-added in informal activities such as the collection of woodfuel and non-wood forest products. For many developing countries, these activities are significant and it is suspected that the contribution of these activities is not captured in published statistics. Therefore, it is probably correct to state that the figures presented here only represent activities in the “*formal*” forestry sector. This is a very serious limitation of this study, which may be examined in a future study on this topic.

Structure of the report

The rest of this report is divided into two major sections, followed by a short section presenting a summary and the conclusions of the study. The next section describes the terminology, data sources and methodology used in the study. The section after this presents the data at the global and regional levels and the analysis of the historical trends in the data. This section is further subdivided into three sub-sections covering employment, value-added and trade. Two annexes present a list of references used as sources of information for each country and detailed information for each country.

DATA SOURCES AND METHODOLOGY

Data sources and methodology used in this study are the same as in previous study (FAO, 2004a³). This chapter highlights the main points and the differences from the previous work.

Terminology, definitions and measurement units

In order to compare and combine data from different sources, it is important to use statistics that are collected using comparable terminology, definitions and measurement units. The following text describes the definition of the forestry sector used in this study, explains some important issues related to the measurement of employment, value-added and trade and presents the regions used in the study.

Definition of the forestry sector

There is no commonly agreed definition of the forestry sector. Ideally, the sector should be defined to include all economic activities that mostly depend on the production of goods and services from forests. This would include commercial activities that are dependent on the production of wood fibre (i.e. production of industrial roundwood, woodfuel and charcoal; sawnwood and wood based panels; pulp and paper; and wooden furniture). It would also include activities such as the commercial production and processing of non-wood forest products and the subsistence use of forest products. It could even include economic activities related to production of forest services (although it would be difficult to determine exactly which activities are really dependent on forest services).

The text above gives a broad and inclusive definition of the forestry sector, but a narrower and less precise definition of the sector had to be used in this study. This was due to limitations such as the availability of published statistics and the definitions already used in the compilation of those statistics.

Employment and value-added. In most countries, statistics on employment and value-added are two important components of a broad range of macroeconomic statistics that are collected to monitor trends in the economy. These statistics are usually collected by national statistical offices (rather than sectoral agencies such as forestry administrations), so they are classified using classification systems that are structured according to the type of economic activity rather than the type of product produced by each sector.

Some countries use their own macroeconomic classification systems (see below), but many use the International Standard Industrial Classification of all Economic Activities (ISIC). This classification system is maintained by the United Nations (UN) and is periodically revised by the UN with the agreement of member nations.

³ Available online at: <http://www.fao.org/docrep/007/ad493e/ad493e00.htm>

The version of the ISIC used for most of the period 1990 to 2006 (ISIC Revisions 3.0 and 3.1) includes three sub-sectors (called Divisions in the ISIC) that clearly fall within the definition of the forestry sector given above. These are:

- ISIC Division 02 (forestry, logging and related service activities);
- ISIC Division 20 (manufacture of wood and of products of wood and cork, except furniture; manufacture of articles of straw and plaiting materials); and
- ISIC Division 21 (manufacture of paper and paper products).

In addition to these three Divisions, forest dependent activities also appear as part of other sub-sectors (i.e. Classes) in the ISIC, e.g. manufacture of furniture, manufacture of agricultural and forestry machinery, printing, transport, wholesale and retail trade, private household and recreational activities and others. All these activities generate employment and value-added, however, it is not possible to distinguish between forest dependent activities and other activities within these sub-sectors. Therefore, for the statistics on employment and value-added presented later on in this report, the forestry sector was simply defined as the sum of ISIC Divisions 02, 20 and 21.⁴ (For brevity, these three sub-sectors or Divisions are referred to as “*forestry*”, the “*wood industry*” and the “*pulp and paper industry*” hereafter, while the combination of all three sub-sectors is referred to as the “*forestry sector*”).

In addition to the ISIC, some countries also use their own national (or regional) classifications of economic activities (e.g. the North American Industry Classification System or NAICS and the Statistical Classification of Economic Activities in the European Community or NACE). These classification systems are slightly different to the ISIC in terms of their structure and their definitions of each sector. However, the differences are generally quite small and protocols exist for translating statistics from these classification systems to the ISIC structure. Furthermore, comparison of the different classifications showed that there is very little difference in the definitions of forestry sector activities.

Wherever possible, this study presents statistics that have been published using the ISIC Revision 3.0. However, in some cases, statistics collected using the ISIC Revision 3.0 were only available for a few years, compared to a complete set of statistics (i.e. for the whole of the period 1990 to 2006) collected using a national classification system. In such cases (e.g. Canada, USA), the latter statistics have been presented to ensure consistency and comparability over time.

The previous text has highlighted some of the complexity of the issues concerning the definition of the forestry sector and the difficulties of identifying the sector within the most common classification systems currently used to monitor economic activities. The approach taken in this study was to use a fairly simple and restrictive definition of the sector. Therefore, it should be noted that the figures presented later on are probably a minimum estimate of the importance of the sector, particularly in countries where informal forestry sector activities are significant.

⁴ This definition matches the definition of the forest sector approved by the Ministerial Conference on the Protection of Forests in Europe (MCPFE, 2002), which has been used to develop improved Pan-European indicators for sustainable forest management.

Trade. The forest products statistics compiled and disseminated by FAO include the following: roundwood; wood chips, residues and charcoal; solid wood products (sawnwood and wood based panels); and pulp and paper. Statistics are available for the value of international trade (imports and exports) in these products for every country and territory in the World over the period 1961 and 2007. In addition, FAO recently started collection of trade data on further processed wood and paper products (further processed products like wooden furniture, paper products ready for use, etc.). UN Commodity Trade Statistics Database (COMTRADE) publishes export and import data of all commodities for countries from 1962 onwards.

Statistics from FAOSTAT and COMTRADE were collated to produce datasets of forest products from three sub-sectors:

- Forestry (roundwood and non-wood forest products (NWFPs)⁵);
- Wood industry (sawnwood, wood-based panels, wood chips and residues, charcoal and further processed wood products excluding furniture⁶); and
- Pulp and paper industry (pulp, recovered paper, paper, and further processed paper products excluding printed articles⁷).

For the statistics on export and import presented later on in this report, forest products were simply defined as the sum of the products from the three sub-sectors mentioned above. (For brevity, they are referred to as “*forestry products*”, the “*wood industry products*” and the “*pulp and paper industry products*” hereafter, while the combination of all three sub-sectors is referred to as the “*forest products*”).

It should be noted that the industries that produce these products do not exactly match the definitions used in the ISIC. Firstly, charcoal production (outside of the forest) is one of a number of activities under Class 2411 in ISIC.⁸ The overwhelming majority of global charcoal production occurs in developing countries, where it is nearly all produced in the forest, but large scale production for export is probably produced in factories (and, therefore, would fall under ISIC Class 2411). Charcoal is listed under wood industry products in the analysis of forest products trade in this report. A second difference arises because the FAOSTAT trade statistics include trade in recovered paper, which is not included as an activity of the pulp and paper industry (ISIC Division 21).

Definition and measurement of employment, value-added and trade

Employment. Official forestry sector employment statistics rarely define the measurement units used. There is a lot of part-time employment and seasonal employment in forests. In addition, informal employment and subsistence activities are significant in the forestry sector in developing countries. The latter is often missing from official employment statistics and

⁵ Include 23 commodities of NWFPs, see Note in Annex 2 Table 13 (source: FAO, 2005 p.15)

⁶ See full list of commodities in Note of Annex 2 Table 14

⁷ See full list of commodities in Note of Annex 2 Table 15

⁸ Charcoal production in the forest is included in ISIC Revision 3.0 under Class 0200, but the definition of Class 2411 (Manufacture of basic chemicals, except fertilizers and nitrogen compounds) also includes manufacturing of charcoal from the distillation of wood.

some of the published statistics collected for this study gave figures that seemed very high (suggesting that some of this employment was part-time). On the other hand, annual industrial censuses in countries often exclude small enterprises and do not provide full picture. For example, 87 percent of manufacturing jobs in India are with companies that employ fewer than ten people (EIU, 2008), while annual survey of industries provide statistics for factories employing 20 or more workers (UNIDO, 2008)

Problems such as these make it very difficult to compare between countries. Therefore, wherever possible, employment statistics measured in full-time equivalents were collected (or published statistics were converted to full-time equivalents if that was possible). The problem of employment in the informal and subsistence sectors could not be addressed in the study.

The employment figures presented in this report should be treated as figures for the “*visible*” or “*formal*” employment in the sector. For developed countries, this is likely to include all of the activities included in ISIC Divisions 02, 20 and 21. For developing countries, it is likely to include activities in ISIC Divisions 20 and 21 (wood industry and the pulp and paper industry) plus employment in industrial roundwood production (i.e. only part of ISIC Division 02, excluding woodfuel and charcoal production activities that are probably not captured in official employment statistics).

These figures are likely to be a vast underestimate of the true levels of employment in the forestry sector. For example, according to the International Labour Organization (ILO, 2001a), formal employment only accounts for about one-third of the total employment in the forestry sector.

This study also presents figures about the importance of the forestry sector to total employment. This is measured as the proportion (in percent) of the total economically active population employed in the forestry sector. The total economically active population⁹ refers to the number of all employed and unemployed persons (including those seeking work for the first time). It covers employers, self-employed workers, salaried employees, wage earners, unpaid workers assisting in a family farm or business operation, members of producers' cooperatives and members of the armed forces (FAO, 2008a).

Value-added. Gross value-added is a measure of the contribution to GDP made by an individual producer, industry or sector. The sum of value-added across all sectors is roughly the same as total GDP (indeed, calculating and adding together the value-added in all individual sectors is one methodology used to calculate total GDP and is called production approach).

In many countries, GDP is estimated using the production approach, so it was quite easy to obtain statistics for value-added in the forestry sector for countries that had published national income accounts. However, for a number of countries (especially developing countries) the availability of national income accounts was limited or the only statistics available were quite old. In such cases, a variety of methods were used to produce estimates to complete the dataset (see below).

Most national income accounts presented statistics for each sector that showed the gross value-added at basic prices or factor cost. Value-added at basic prices or factor cost are quite

⁹ This is also called the labour force.

similar, so data collection focused on obtaining statistics for value-added calculated by these methods rather than statistics calculated using alternative measures of value-added.

The study also presents figures that show the contribution of the forestry sector to national economies. The measure used to show this was the gross value-added in the forestry sector, expressed as a proportion (in percent) of the total gross value-added at factor cost (i.e. the gross value-added of all sectors added together). Total gross value-added is roughly the same as total GDP, but it should be noted that published GDP statistics are often reported at market prices.¹⁰

Trade. Internationally agreed definitions of forest products already exist and are presented in the Forest Products Yearbook (for further details, see: FAO, 2008b). FAO statistics record the value of imports and exports of the following products and product aggregates: roundwood; wood charcoal; wood chips and particles; wood residues; sawnwood; wood-based panels; wood pulp; other fibre pulp; paper and paperboard; and recovered paper. These statistics were supplemented with COMTRADE (UN, 2008d) data on non-wood forest products and further processed wood and paper products excluding furniture and printed articles. Total trade of the forestry sector was defined as total trade in all of these products.

At the level of the three sub-sectors, products from the forestry sub-sector (i.e. ISIC Division 02) were defined as roundwood and non-wood forest products; wood industry products were defined as wood chips and particles, wood residues, wood charcoal, sawnwood, wood-based panels and further processed wood products; and pulp and paper industry products were defined as wood pulp, other fibre pulp, recovered paper, paper and paperboard and further processed paper products.

As noted above, the definition of the forestry sector in this study does not include wooden furniture (part of ISIC Class 3610). Therefore the value of wooden furniture exports and imports is provided separately (see tables 16 and 23 in Annex 2) and it is not included into the total value of forest products.

In the report, the contribution of the forestry sector to trade is measured as the share of forest products trade in total merchandise trade (exports and imports). Merchandise trade includes the value of trade in all goods provided (exports) or received (imports) by a country from the rest of the world (World Bank, 2008). It should be noted that this excludes trade in services.

Measurement of value. The value-added and trade statistics are all reported in United States Dollars (USD) at the price levels and exchange rates prevailing in the last year of the dataset (2006 for value-added and 2007 for trade). Most of the original statistics were reported in a variety of currency units and were not adjusted for inflation. Therefore, they were converted to this common measurement unit in three stages.

First, where necessary, statistics were converted to local currency units at the exchange rates prevailing in each year. Secondly, the statistics for each country were then converted to the price levels prevailing in each country in the year 2006 or 2007 (i.e. they were adjusted for inflation). For this purpose, GDP deflators (value-added data) and export and import deflators

¹⁰ Total gross value-added at factor cost was used in this calculation so that comparable figures were used to calculate the importance of the sector. Readers may be more familiar with published GDP figures, which are often expressed at market prices. These figures are roughly 10 percent higher than GDP at factor cost, so readers should be aware of this discrepancy.

(trade data) were used for each country. Finally, the statistics for each country (measured in local currency at last year price levels) were converted to USD using the exchange rate in 2006 for value-added or 2007 for export and import value.

Geographical regions

The structure and importance of the forestry sector is very different in different parts of the World. Therefore, the following analysis presents figures at the regional level in addition to figures for individual countries and the World as a whole. For this purpose, the World was divided into the following eight geographical regions:

- Sub-Saharan Africa (all countries in Africa, other than listed below);
- North Africa, Western and Central Asia (Afghanistan, Algeria, Armenia, Azerbaijan, Bahrain, Cyprus, Egypt, Georgia, Iran (Islamic Republic of), Iraq, Israel, Jordan, Kazakhstan, Kuwait, Kyrgyzstan, Lebanon, Libyan Arab Jamahiriya, Morocco, Occupied Palestinian Territory, Oman, Qatar, Saudi Arabia, Syrian Arab Republic, Tajikistan, Tunisia, Turkey, Turkmenistan, United Arab Emirates, Uzbekistan, Western Sahara and Yemen);
- Developed Asia-Pacific (Australia, Japan and New Zealand);
- Developing Asia-Pacific (all countries in Asia and Oceania, other than those listed above);
- Western Europe (all countries in Europe, other than those listed below);
- Eastern Europe (Albania, Belarus, Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Montenegro, Poland, Republic of Moldova, Romania, Russian Federation, Serbia, Slovakia, Slovenia, TFYR Macedonia and Ukraine);
- Northern America (Bermuda, Canada, Greenland, Saint Pierre and Miquelon and United States of America); and
- Latin America and the Caribbean.

Data sources

Data for updating the databases used in the previous study (FAO, 2004a) were obtained from a variety of sources. This includes information from international organisations (e.g. EUROSTAT, FAO, ILO, UN Statistics Division, UNIDO and the World Bank), plus information from more than 150 national statistical reports and other literature (see Annex 1).

Forestry employment statistics were collected from national statistical publications, other national reports and country reports for FAO Global Forest Resources Assessment 2005 (FAO, 2006) and Latin America Forestry Sector Outlook Study (FAO, 2004b). Employment statistics for the wood industry and pulp and paper industry were taken from the UNIDO yearbook (UNIDO, 2008), online databases of other international organisations (EUROSTAT, 2008; ILO, 2008; OECD, 2008) and national statistics and other reports. Statistics for the total labour force were taken from the FAOSTAT database (FAO, 2008).

Value-added statistics for forestry (ISIC Division 02) were obtained from the UN Statistics Division (UN, 2008b) and other international organisations (AFRISTAT, 2008; EUROSTAT, 2008). Statistics for value-added in the wood industry and pulp and paper industry were

mostly obtained from the UNIDO, EUROSTAT and OECD databases and supporting publications. All of this information was supplemented with statistics from various reports published by national statistical services.

Forestry sector trade data was taken from the FAOSTAT and COMTRADE databases; where the total value of exports and imports are presented in current USD (i.e. the figures are not adjusted for inflation).

Macroeconomic statistics including total GDP, value-added, exchange rates and deflators for every country were obtained from UN Statistics Division (UN, 2008a) and the World Bank (2008). Statistics for the total value of merchandise trade were obtained from the World Bank website.

The following analysis contains other measures derived from these basic statistics (e.g. value-added per cubic metre of production) and forestry statistics were also used to estimate missing data. Most of the forest and forest products statistics used in this analysis were taken from FAO databases. For example, statistics for the production, trade and apparent consumption of forest products were taken from the FAOSTAT statistical database and forest cover statistics were taken from the Global Forest Resource Assessment (FAO, 2006).

Data coverage

The aim of this report was to cover all countries and territories in the World. For the macroeconomic statistics required to show the contribution of the sector to national economies (e.g. total labour force, total gross value-added, total merchandise trade), published official statistics could be obtained for almost every one of these countries and territories. However, in a few cases (10 countries and territories) it was necessary to estimate figures or use unofficial sources of information.¹¹

At the level of the forestry sector and the three sub-sectors (forestry, wood industry and pulp and paper industry), the availability of statistics was much more limited. FAOSTAT contains trade statistics for every country and territory in the World, but published annual statistics about employment and value-added in the forestry sector were not available for a large number of countries.

Apart from countries where no statistics were available, the main problem encountered was that many countries do not publish their statistics in sufficient detail. Therefore, for example, statistics about value-added are often published at the level of the ISIC Section (e.g. Section A: Agriculture, hunting and forestry) and are not shown for individual Divisions (e.g. Division 02). In other cases, some countries publish statistics for non-standard combinations of sub-sectors (e.g. giving value-added in the wood and furniture industries together). In the case of value-added statistics, another problem was that some countries only publish statistics that show the value of gross output (although this can be used as a basis for estimating the value-added in the sector).

¹¹ In almost all of these cases these were very small countries, where it is likely that the forestry sector is not very important. Therefore, the reliability of these estimates is unlikely to affect the reliability of the estimates presented at the sub-regional and global levels. This comment also applies to some of the other statistics required for this analysis (e.g. exchange rates and national GDP deflators).

The following text presents an overview of the availability of published statistics on employment and value-added, which can be used to judge the reliability of the global and regional totals presented later on.

Forestry sector employment statistics

The availability of official employment statistics for the forestry sector is presented in Table 1 and Table 2. Table 1 clearly shows that the availability of statistics is most limited for the forestry sub-sector (ISIC Division 02), where published statistics were available for only 49 countries each year (on average).

One of the main reasons for the small number of statistics for the forestry sub-sector is that there is no global international database containing all of these statistics. The ILO has published a few studies on this topic, but much of the information presented here was collected from national statistical reports or reports about the forestry sector commissioned by FAO. More data became available for 1990 and 2000 after the latest Global Forest Resources Assessment 2005 (FAO, 2006), but it should be noted that not all the numbers provided in country reports were used in this study because of limited quality and comparability of data.

Table 1 *Total number of official employment statistics collected for each year*

Year	Forestry sector			Furniture industry
	Forestry	Wood industry	Pulp and paper industry	
1990	86	112	114	114
1991	31	115	116	113
1992	35	115	116	112
1993	40	122	125	124
1994	58	123	127	122
1995	58	123	124	119
1996	45	124	121	117
1997	50	120	112	111
1998	47	119	116	114
1999	48	115	108	108
2000	105	118	109	111
2001	37	109	104	111
2002	38	101	98	101
2003	41	99	93	95
2004	37	88	84	86
2005	47	83	77	78
2006	26	61	57	51
Average (1990-2006)	49	109	106	105

Note: the figures represent the number of countries covered by published official statistics for each sub-sector in each year. For example, the table shows that official forestry employment statistics for the year 1990 were obtained for 86 countries.

The availability of employment statistics for the wood industry and pulp and paper industry was much better, with published statistics for employment in the wood industry for 109 countries each year (on average) and statistics for pulp and paper industry employment for 106 countries. The greater amount of employment statistics for these two sub-sectors is due to the existence of the UNIDO and ILO databases and supporting publications.

The availability of employment statistics was also very different by region (see Table 2). As might be expected, most published statistics were available for developed regions (Northern America, the Developed Asia-Pacific region and Europe). It was much more difficult to obtain published statistics for many countries in Africa, Latin America and the Caribbean and the rest of Asia.

Table 2 *Average number of employment statistics collected for each year (over the period 1990 to 2006) by region*

Region	Forestry sector			Furniture industry
	Forestry	Wood industry	Pulp and paper industry	
Sub-Saharan Africa	5	14	13	12
North Africa, Western and Central Asia	3	18	18	18
Developed Asia-Pacific	2	3	3	3
Developing Asia-Pacific	6	15	14	15
Western Europe	12	20	19	19
Eastern Europe	14	18	18	18
Northern America	2	3	3	3
Latin America and the Caribbean	5	17	17	17
World	49	109	106	105

Note: the figures represent the average number of countries covered by published official statistics for each sub-sector in each region. For example, the table shows that official forestry employment statistics were obtained for 5 countries (on average) in Sub-Saharan Africa over the whole of the period 1990 to 2006.

Although the total number of countries covered by the statistics collected for this study seems quite small (e.g. less than 50 percent of all countries and territories in the World), it should be noted that official statistics were available for most of the countries with significant forest areas and significant levels of forest product production. For example, the countries where official employment statistics were obtained at least for some years covered the following:

- Forestry sub-sector: official employment statistics were obtained from countries that account for 93 percent of the global forest area, 99 percent of global industrial roundwood production and 92 percent of global roundwood production (in 2006).
- Wood industry sub-sector: official employment statistics were obtained from countries that account for 99.8 percent of global sawnwood and wood-based panel production (in 2006).
- Pulp and paper industry sub-sector: official employment statistics were obtained from countries that account for 99.9 percent of global pulp and paper production (in 2006).

As the above figures show, the official employment statistics included in the dataset cover a significant proportion of global forestry sector activities. Furthermore, forestry sector employment is probably zero (or close to zero) in many of the countries where data could not be obtained (e.g. many of these countries do not report any production of forest products to FAO). Therefore, it is likely that the global and regional totals presented later on are quite reliable (particularly in the case of developed regions).

With respect to the quality of the official employment statistics, it was difficult to judge how accurate or reliable the published official statistics were, because very little information could be obtained about how they were collected. It was suspected that the main problem with

official statistics might be the estimation and measurement of employment in the informal forestry sub-sector and in small-scale wood processing operations (where it is often difficult to obtain reliable information).

It was suspected that most countries do not include informal sector activities in their employment statistics. However, one problem that was encountered was where developing countries included estimates of employment in woodfuel collection in their employment statistics for the forestry sub-sector. In almost all cases, these figures were extremely high, suggesting that they had not been adjusted to full-time equivalents.¹²

A decision was taken to deliberately exclude woodfuel employment figures (wherever possible), in order to get statistics that were probably more comparable across countries (e.g. the woodfuel employment statistics were discarded where they were presented separately or, in other cases, very high figures for total employment were reduced by the proportion of woodfuel production in total roundwood production). Thus, the employment figures presented in this report are for employment in the formal forestry sector.

Finally, it should be noted that whole data series for several countries (e.g. China, Brazil, Mexico and Turkey) were completely revised. This affected regional numbers and trends, which are now different those in the previous FAO study (2004a).

Statistics for value-added in the forestry sector

In general, the availability of value-added statistics for the forestry sub-sector (ISIC Division 02) is better than the availability of employment statistics. Statistics were obtained for 111 countries each year (on average) compared with only 49 countries producing statistics for employment in the forestry sub-sector.

A greater number of value-added statistics was collected because many countries produce national income accounts, which are either published as national reports or are included in the UN database of national income accounts. Thus, the availability of statistics was generally higher.

For the other two sub-sectors (wood industry and pulp and paper industry) the availability of value-added statistics was slightly lower than the availability of employment statistics. The main reason for this was that the UNIDO database and publications contained slightly fewer statistics for value-added compared with the statistics available for employment.

The numbers of published official statistics for value-added in each sub-sector are shown by year in Table 3 and by region in Table 4. The availability of published official statistics for value-added in the sector was again generally better for developed countries compared with developing countries. However, the number of developing countries publishing statistics for value-added in the forestry sector was much higher than the number that published employment statistics.

¹² For example, in many cases, the employment statistics suggested levels of roundwood production of only one or two cubic metres (m³) per employee per year.

Table 3 *Total number of official value-added statistics collected for each year*

Year	Forestry sector			Furniture industry
	Forestry	Wood industry	Pulp and paper industry	
1990	83	100	94	86
1991	83	103	99	91
1992	92	103	99	87
1993	102	109	103	97
1994	107	113	108	98
1995	126	111	109	101
1996	131	109	108	97
1997	132	105	100	95
1998	129	105	102	94
1999	126	97	93	91
2000	123	99	92	92
2001	121	94	88	93
2002	120	96	90	91
2003	121	91	85	83
2004	116	89	80	77
2005	110	82	74	69
2006	73	48	33	43
Average (1990-2006)	111	97	92	87

Note: the figures represent the number of countries covered by published official statistics for each sub-sector in each year. For example, the table shows that official statistics for value-added in the forestry sub-sector in the year 1990 were obtained for 83 countries.

For example, official statistics for value-added in the forestry sub-sector were obtained for 28 countries in Sub-Saharan Africa (on average each year) compared with only five countries (on average each year) publishing employment statistics for this sub-sector. Similar increases in the availability of statistics were also noted for the other developing regions.

Table 4 *Average number of value-added statistics collected for each year (over the period 1990 to 2006) by region*

Region	Forestry sector			Furniture industry
	Forestry	Wood industry	Pulp and paper industry	
Sub-Saharan Africa	28	15	12	12
North Africa, Western and Central Asia	8	13	13	12
Developed Asia-Pacific	2	3	3	3
Developing Asia-Pacific	19	14	14	13
Western Europe	17	18	17	18
Eastern Europe	12	14	13	12
Northern America	2	2	2	2
Latin America and the Caribbean	23	17	17	15
World	111	97	92	87

Note: the figures represent the average number of countries covered by published official statistics for each sub-sector in each region. For example, the table shows that official statistics for value-added in the forestry sub-sector were obtained for 28 countries (on average) in Sub-Saharan Africa over the whole of the period 1990 to 2006.

Again, in order to give a more reasonable assessment of the significance of the countries that produced official statistics, the following should be noted:

- Forestry sub-sector: official value-added statistics were obtained from countries that account for 91 percent of global forest area, 99 percent of global industrial roundwood production and 95 of global roundwood production (in 2006)
- Wood industries sub-sector: official value-added statistics were obtained from countries that account for 99.6 percent of global sawnwood and wood-based panel production (in 2006).
- Pulp and paper sub-sector: official value-added statistics were obtained from countries that account for 99.9 percent of global pulp and paper production (in 2006).

It was not possible to assess the quality of the official statistics for value-added obtained as part of this study, although it can be expected that similar comments to those above (for employment statistics) would apply to some of the official statistics for value-added in the forestry sector.

Methodology for checking and estimating missing data

As part of the analysis presented later on, the statistics on employment and value-added were converted to a number of indicators of productivity in the three sub-sectors (e.g. production volume per employee in cubic metres (m³), value-added per m³ of production, etc.). These measures were also used to assess the validity of published official statistics, to make adjustments to these statistics (in some cases) and to estimate missing data.

For example, for the forestry sub-sector (ISIC Division 02), labour productivity was calculated as total roundwood production per employee in Northern America, Western Europe, Eastern Europe and the Developed Asia-Pacific region and as industrial roundwood production per employee in developing countries (all other regions).

As noted previously, in some cases (e.g. Malawi and Bangladesh), the official forestry employment figures were reduced by the proportion of woodfuel production in total roundwood production, to convert the total employment statistics to figures for employment in formal forestry activities (i.e. industrial roundwood production). This conversion led to estimates of productivity that were comparable to similar countries in the same sub-region. In other cases, official statistics for employment in woodfuel production were deliberately not included in the statistics shown here for employment in the forestry sub-sector. These changes were made to improve comparability across countries, although they result in an underestimation of total employment in the forestry sub-sector in developing countries (i.e. because they exclude informal activities such as woodfuel production).

Similarly, productivity in the wood industry (sawnwood and wood based panel production per employee in m³) and in the pulp and paper industry (pulp and paper production per employee in tonnes) was also calculated to check and validate the published official statistics.

As noted above, a large number of the small countries and territories included in this study do not report any production of forest products to FAO. In these cases, it can be safely assumed

that employment and value-added in the (formal) forestry sector is probably zero (or close to zero). Therefore, no further action was taken to try to estimate missing data for employment and value-added in the sector in these countries.

However, there were a number of countries with significant levels of production in the forestry sector, but no published official statistics for employment and value-added in the three sub-sectors. In such cases, estimates for employment and value-added were produced for the most important countries to complete the dataset across all countries and all years.

For the estimation of employment in the three sub-sectors, the following methodologies were used (in order of preference):¹³

- E 1. For countries with some official forestry employment statistics (e.g. for a few years), estimates of employment were based on the reported production levels in the years where no employment statistics were available. Thus, for example, productivity per employee (roundwood or industrial roundwood production per employee) was calculated from the available official employment statistics. These figures were then multiplied by the reported production levels in the years without official employment statistics, to produce estimates of employment in those years.

The same process was used to estimate employment in the wood industry and pulp and paper industry sub-sectors in years where no official statistics were available. In these sub-sectors, the measures of productivity used to produce estimates were the amount of solid wood production per employee (i.e. sawnwood and wood based panel production in m³ per employee) or the amount of pulp and paper production per employee (in tonnes).

- E 2. For countries with no official employment statistics for one or more of the sub-sectors over the whole of the period 1990 to 2006, employment was estimated in roughly the same way. However, in these cases, reported production in a country was multiplied by the average productivity levels (in each sub-sector) calculated from the official statistics for neighbouring countries.¹⁴

For the estimation of value-added in the three sub-sectors, the following methodologies were used (in order of preference):

- V 1. For countries with some official value-added statistics and a more complete set of official statistics for the value of gross output, estimates of value-added were based on the gross output statistics (if available) in the years where value-added statistics were not available. This was done by calculating the ratio of value-added to the value of gross output (in the years where both statistics were available) and applying this ratio to the gross output statistics in years where these statistics were available but value-added statistics were missing.

¹³ Note: these codes - E1, E2, V1, V2 and V3 - are used in the notes to the country tables presented at the end of this report.

¹⁴ Note that each such case is flagged and comments provided in the datasets which were produced during this study. The database can be freely obtained from FAO (e-mail: arvydas.lebedys@fao.org or adrian.whiteman@fao.org)

- V 2. For countries with some official value-added statistics, but no gross output statistics for the years where value-added statistics were unavailable, the average value-added per unit of output was used with reported production statistics to estimate total value-added. This calculation was similar to that explained in E1 above. For example, the available official statistics were used to calculate value-added per m³ of roundwood or industrial roundwood production (for the forestry sub-sector) and these figures were then multiplied by reported roundwood or industrial roundwood production to estimate total value-added in the forestry sub-sector in the years where official statistics were not available. The same calculations were performed for the wood industry and pulp and paper industry sub-sectors, except that the productivity measures used were value-added per m³ of solid wood production (sawnwood and wood based panels) and value-added per tonne of pulp and paper production.
- V 3. For countries with no official value-added statistics, value-added in the three sub-sectors was estimated in the same way as above (V2), but using the average value-added per unit of output calculated from official statistics for neighbouring countries (i.e. in the same way that employment estimates were produced under method E2 above).

The above text gives a broad outline of the different methodologies used to check and estimate missing data. The application of these methodologies varied from country to country, depending on the amount of official published statistics that were available and the trends observed in the productivity measures calculated from these statistics.

For example, in some cases, average productivity levels (from all of the published statistics) were used to produce estimates for years where statistics were not available. In cases where statistics were not available for one year, the average of the levels of productivity in the preceding and following years was used to produce an estimate for that year. In other cases, trends in productivity levels were observed and were used to produce estimates.

A final point to note is that some countries in the dataset did not exist in the early-1990s (e.g. countries of the former-USSR, Czechoslovakia and Yugoslavia). In the tables presented later in this report, the figures for these countries in earlier years have been estimated by dividing the totals for the original larger countries according to each new country's estimated share of total production in the larger country.

These figures are probably not very reliable at the country level. However, at the level of the regional analysis, this is not very important. Only the countries of the former-USSR are divided into two of the regions defined and used here and almost all of the forestry sector production in the countries of the former-USSR occurs in the Eastern Europe region.

ANALYSIS OF TRENDS AND CURRENT STATUS

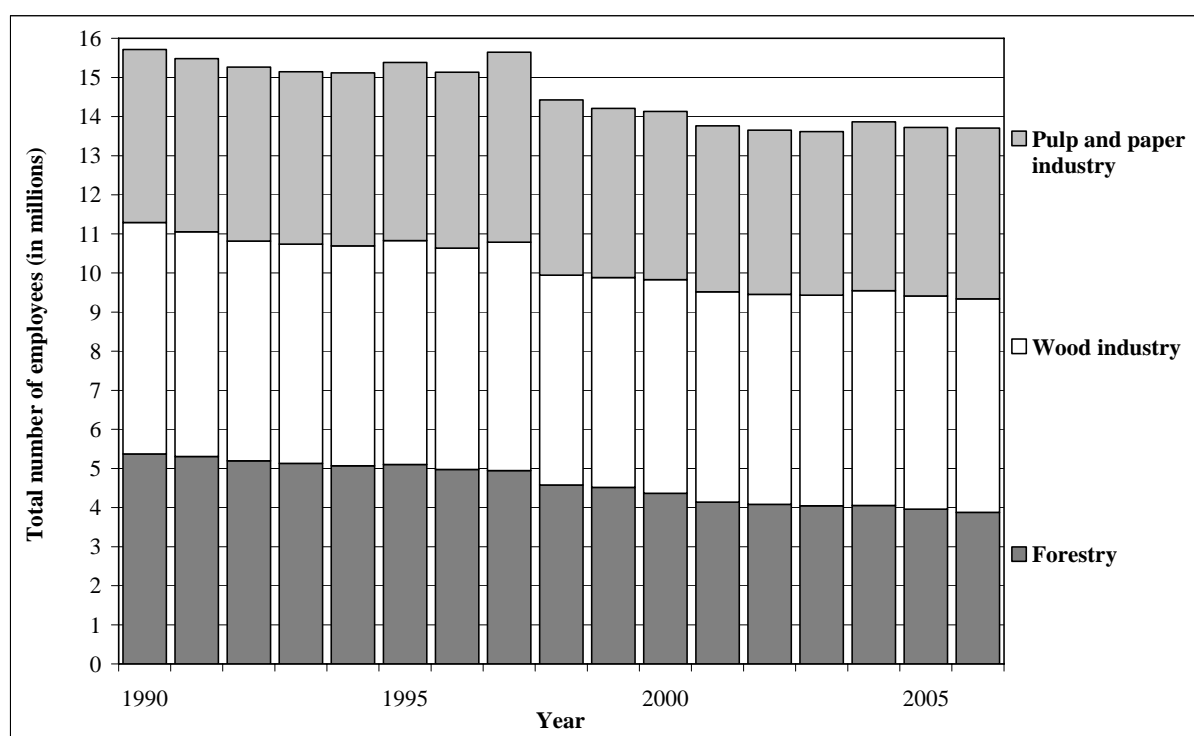

This section presents the analysis of the dataset. It examines trends in the contribution of the forestry sector to national economies and it compares the importance of the sector in different geographical regions. It also examines trends in productivity and highlights differences in the structure of the sector in different regions (i.e. the relative contributions of the forestry, wood industry and pulp and paper industry sub-sectors). The section is divided into three main parts, covering employment, value-added and trade.

Employment in the forestry sector

Trends in total employment

Figure 1 shows the trends in total employment in the forestry sector over the period 1990 to 2006. The figure shows that total employment decreased by about 15 percent, from 15.7 million in 1990 to 13.7 million in 2006. In addition to this, at least four million people were employed in the furniture industry over the period (with slight trend upwards in this figure). Many of these people were employed to produce wooden furniture.

Figure 1 *Forestry sector employment by sub-sector, 1990-2006*

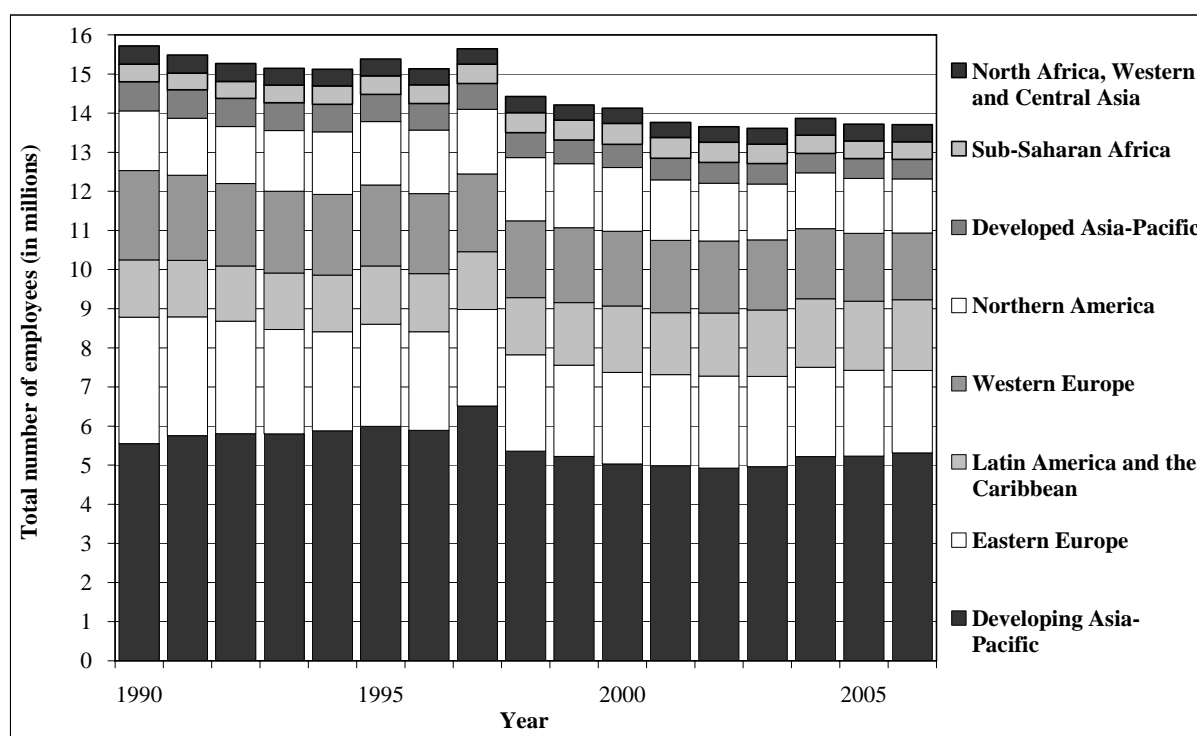

An interesting feature of this figure is that, at the global level, employment is roughly equal between three main sub-sectors: forestry, wood industry and the pulp and paper industry. For example, one job in (formal) forestry activities (ISIC Division 02) led to industrial roundwood production that supported 1.2 jobs in the wood industry and one job in the pulp and paper industry (on average over the whole period).

However, these multipliers increased over the period 1990 to 2006, from 1.1 in 1990 to 1.4 in 2006 (for the wood industry) and from 0.8 to 1.1 (for the pulp and paper industry). There are two main reasons why these multipliers changed. First, employment in forestry decreased over the period drastically (from 5.4 million to 3.9 million). Secondly, employment in the wood industry declined slightly (from 5.9 million to 5.5 million). At the same time, the total number of people employed in pulp and paper industry remained stable at about 4.4 million.

The employment statistics also show that, in 2006, approximately one person was employed in (formal) forestry for every 1,000 ha of forest (at the global level) and that this employment was supplemented by another two jobs in forest processing (wood industry and pulp and paper industry). However, the distribution of employment between the three sub-sectors varies by region and so do these multipliers. For example, there are six to nine jobs in forest processing for every one job in forestry in Northern America, Western Europe and Developed Asia-Pacific regions. In developing countries and Eastern Europe the ratio is roughly 1 to 2. In North Africa, Western and Central Asia one job in forestry leads to four jobs in forest processing.

Figure 2 *Forestry sector employment by region, 1990-2006*

The distribution of employment in the forestry sector across regions is shown in Figure 2. Each region displays different trends and patterns in employment, but these can be simply grouped into four different types of trend: declining; stable; increasing; or reversed employment in the forestry sector.

The regions and major countries with declining employment in the sector are Western and Eastern Europe, Northern America and Japan. There are a number of different reasons for declining employment in these regions. For example, in Western Europe (especially Nordic countries), capital investment is leading to the replacement of manual work with machinery, resulting in increased labour productivity. This accounts for some of the 25 percent drop in forestry sector employment in Western Europe over the last sixteen years.

In contrast, economies in Eastern Europe (including the Russian Federation) had to cope with the transition from centrally planned to market economies. Restructuring, privatisation and the closure of inefficient factories led to a significant drop in production (particularly in the early -1990s), followed by a reduction in employment in these countries. Overall employment in the forestry sector in Eastern Europe fell by 1.1 million or 35 percent over the period 1990 to 2006.

Another possible reason for a decline in forestry sector employment is simply decreasing production (in some cases, combined with a shift to higher levels of forest products imports). The best example of where this has occurred is Japan, where the number of people employed in the forestry sector declined by 38 percent since 1990s.

The regions and countries with stable forestry sector employment in the 1990s were: Sub-Saharan Africa; North Africa, Western and Central Asia, Australia and New Zealand. In some countries, the effects of increased labour productivity have been counterbalanced by new employment opportunities generated by the expansion of forest plantations (e.g. Australia and New Zealand). These subtle changes have helped these countries to maintain stable employment in the forestry sector. The stability in employment in Sub-Saharan Africa is largely due to the generally very slow pace of development in the forestry sector. Total forestry sector employment in Sub-Saharan Africa remained at 0.5 million during the period 1990 to 2006. Employment in the forestry sector in North Africa, Western and Central Asia remained stable at about 0.4 million during the period 1990 to 2006; a slight upward trend was visible for the last years due to expanding pulp and paper industry.

The Latin American and the Caribbean region is the only region where forestry sector employment is growing continuously. It is estimated that 0.3 million additional jobs were created in the forestry sector in these two regions from 1990 to 2006 and this growth occurred across all three sub-sectors. This increase can be explained by the increased production in the regions over the period, supported by the significant availability of forest resources, rapid economic growth and high levels of investment in the sector in many of these countries.

Northern America and Developing Asia-Pacific regions experienced significant changes in the trends in forestry employment during the last sixteen years. Four countries in these regions, China, India, Canada and the United States of America, account for nearly 40 percent of the global employment in the forestry sector, and in all of them employment reversed during the period 1990 to 2006, thus affecting regional and global trends.

Northern America had slightly increasing employment during the past decade; in line with growing production levels 0.1 million new jobs were generated between 1990 and 2000. However increasing competition with imported forest products from other regions, followed by housing market crisis in the United States led to a decline in the forestry sector employment in Northern America region by 0.2 million or 15 percent over the period 2000 to 2006.

Overall, in Developing Asia Pacific region number of persons employed in the forestry sector declined by 0.5 million or nine percent during the 1990s. However, between 2000 and 2006 forestry employment increased by adding 0.3 million jobs and all this increase was caused by growth in China's wood processing and pulp and paper industries.

Employment trends in China have had a major impact at the global level. For example, China accounted for 25 percent of global forestry sector employment in 2006 (i.e. employment in all

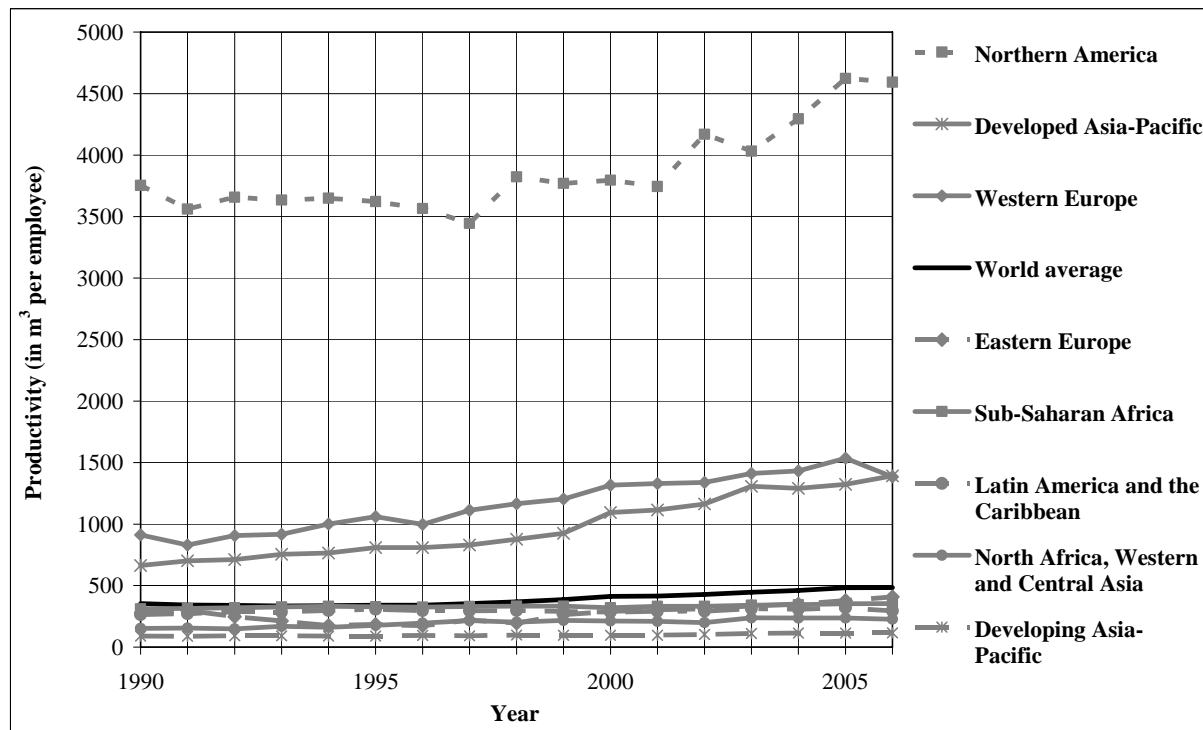

three sub-sectors combined). The changes that took place in the late 1990s in the forestry sector in China had a major impact on global forestry sector employment figures.

In the late-1990s, the Chinese government implemented an environmental protection initiative, which included imposing a ban on logging in more than half of the area of national forests in the country. Following this, employment in China's forest industries dropped by 24 percent or 1.1 million in 1998 (ILO, 2001a; UNIDO, 2006a). This reduction in China accounted for much of the fall in employment in the forestry sector recorded at the global level in 1998 (a reduction of 1.2 million or eight percent). In later years until 2002 employment in forestry sector in China declined by another 0.5 million. However, starting from 2003 the trend reversed and 0.4 million new jobs were created in China's forestry sector by 2006, due to rapid expansion of forest processing industries (while employment in forestry sub-sector continued to fall). Similar employment trends are seen in India and Viet Nam in recent years.

Trends in labour productivity

Labour productivity has been calculated by dividing the employment numbers for each sub-sector by the corresponding figures for annual production in each sub-sector (from FAO production statistics). It is expressed as the level of production (in m³ or tonnes) per employee. The following text presents the trends in these figures for the different sub-sectors and regions.

Figure 3 *Labour productivity in (formal) forestry activities by region, 1990-2006*

Note: for Northern America, Western and Eastern Europe and the Developed Asia-Pacific regions, these figures are total roundwood production per employee. For the other regions, the figures are industrial roundwood production per employee.

At the global level, productivity in (formal) forestry activities (ISIC Division 02) has increased by 37 percent during the period 1990 to 2006 (see Figure 3). Growth in productivity

has accelerated since late 1990s. Reason for low growth in productivity during 1990s was the reduction in production in former-USSR countries (especially the Russian Federation) reported in the early-1990s. This was a very real fall in labour productivity. Production fell by as much as 50 percent in many of these countries, but employment numbers often did not fall by as much (leading to a reduction in labour productivity). Similar problems were experienced across much of the rest of Eastern Europe. However, since the mid-1990s, productivity in Eastern Europe has started to grow consistently and, in 2006, reached a level that was by almost 50 percent higher than in 1990. In all other regions, except Sub-Saharan Africa and Latin America and the Caribbean, labour productivity has grown considerably over the period, by between 20 percent (Northern America) and 110 percent (Developed Asia-Pacific).

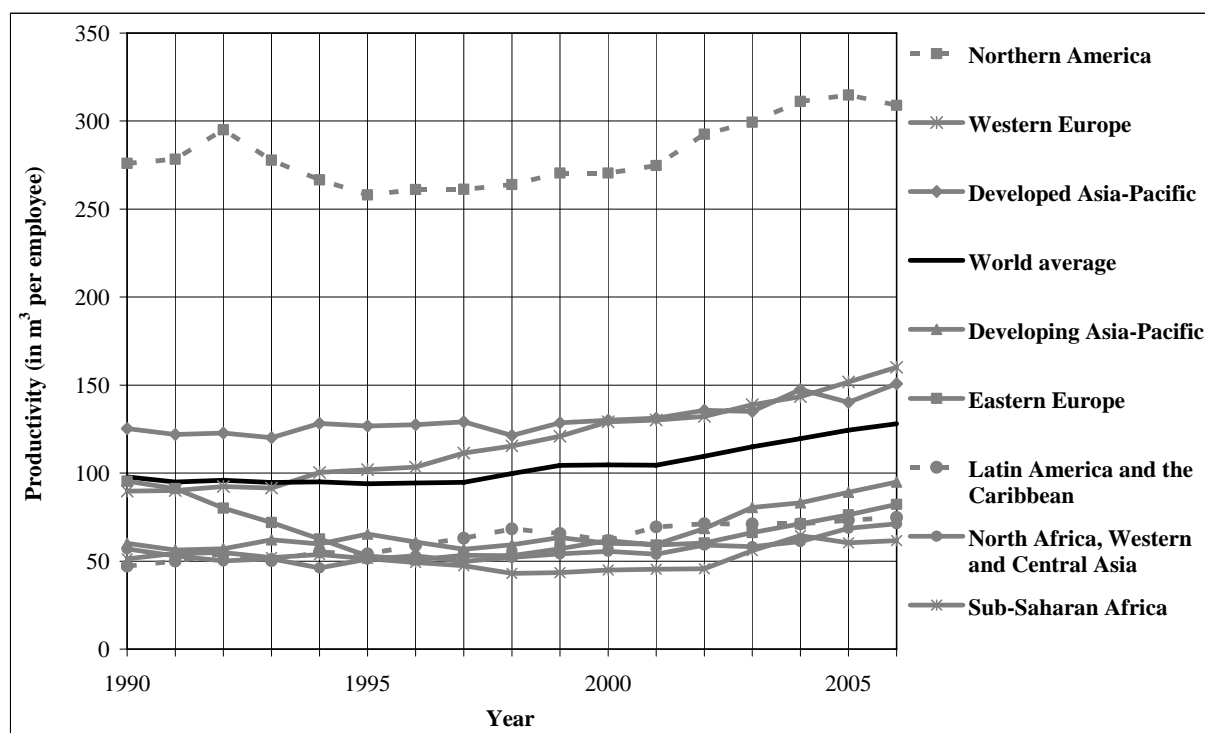

It is noticeable that the level of labour productivity is much higher in Northern America than elsewhere. This is due to the fact that two very well developed countries (Canada and the United States of America) account for most of this region. Nordic countries, Austria, Australia and New Zealand have similarly high levels of labour productivity. After these countries, other West European countries have the next highest levels of labour productivity, followed by countries in Eastern Europe, then developing countries.

One of the explanations of the differences in the levels of labour productivity shown here is that forestry practices are very different in different countries. For example, these figures show roundwood (or industrial roundwood) production per employee, so countries with a lot of people employed in tree planting appear to have very low productivity. In addition, logging conditions in natural forests (e.g. tropical rainforest, boreal forest, temperate forest, etc.) are very different in countries, as are the conditions in countries harvesting forest plantations as opposed to natural forests.

To conclude, the figures presented above give a very general picture of the trends in labour productivity over time and the comparisons in productivity between regions. Detailed knowledge of each individual country would be required to interpret these figures correctly. Alternatively, more detailed and comparable data would be required to study trends over time or to make comparisons between countries and regions. Such analysis is outside the scope of this report, but the figures presented in Annex 2 of this report can be used as a starting point for such analysis.

Labour productivity in the wood industry is expressed as the production of sawnwood and wood-based panels per employee and trends in these figures are shown in Figure 4. At the global level, the trend was relatively flat during the 1990s (7% growth over 10 years). But similarly like in forestry sub-sector, growth of productivity in wood industry accelerated during the last years jumping by 22 percent over during the period 2000 to 2006. At the regional level, an upward trend is visible for all regions starting from the late 1990s. Eastern Europe recovered after a sharp fall in the early-1990s. The highest levels of productivity are achieved in Northern America, followed by Western Europe and Developed Asia-Pacific.

Figure 4 *Recent trends in labour productivity in the wood industry by region, 1990-2006*

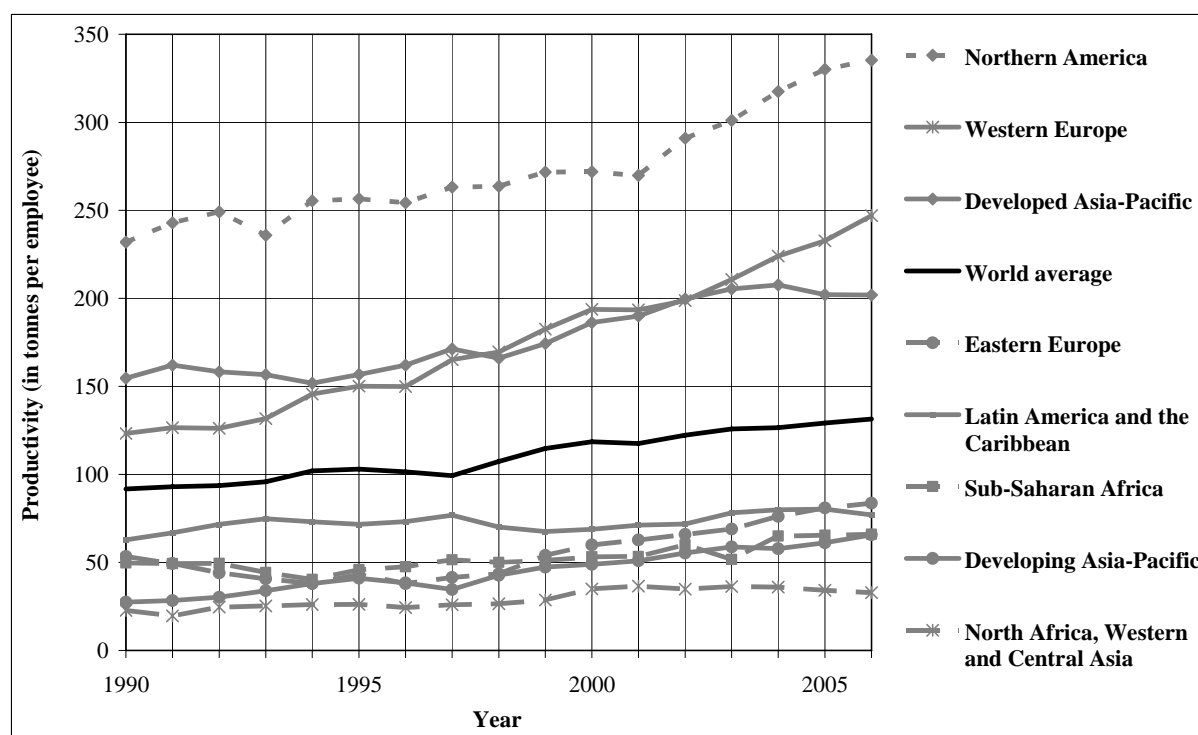

Note: these figures are total sawnwood and wood-based panel production per employee in all regions.

At the level of individual countries, the clear leaders are Sweden, Finland, New Zealand, Chile and Austria where labour productivity has grown from 200 m³ to over 400 m³ per person over the period. In Canada and the United States of America, there have been slight fluctuations in labour productivity, but these countries still have very high levels of productivity compared with the rest of the World.

Compared with developed countries and a few developing countries (e.g. Chile, Republic of Korea), the levels of labour productivity in all other countries remain very low (about half of the global average level of labour productivity). This reflects the great efforts that the leading countries have made to invest in new equipment and machinery and, conversely, the generally poor level of processing technology in most developing countries. However it should be mentioned, that together with globalisation (relocation of production and transfer of new technologies) this gap in productivity is shrinking and this is particularly noticeable in Developing Asia-Pacific and Eastern Europe during the last years.

Finally, it should be noted that figures presented above about the productivity in wood industry are very general and do not take into account the differences in the structure of industries in countries. Therefore countries with prevailing primary processing (sawnwood and wood-based panel production) receive higher ranking in productivity than those where further processing products in wood industry (e.g. many countries in Western Europe, also some major producers and exporters in Eastern Europe, Developing Asia Pacific and Latin America and the Caribbean). But the global and regional figures presented here probably well indicate the trend of improving productivity in wood processing industries.

Figure 5 *Labour productivity in the pulp and paper industry by region, 1990-2006*

Note: these figures are total pulp and paper production per employee in all regions.

Recent trends in labour productivity in the pulp and paper industry are shown in Figure 5. The first noticeable point about this figure is that labour productivity has increased both globally (by 43 percent) and in all regions of the World over the period 1990 to 2006.

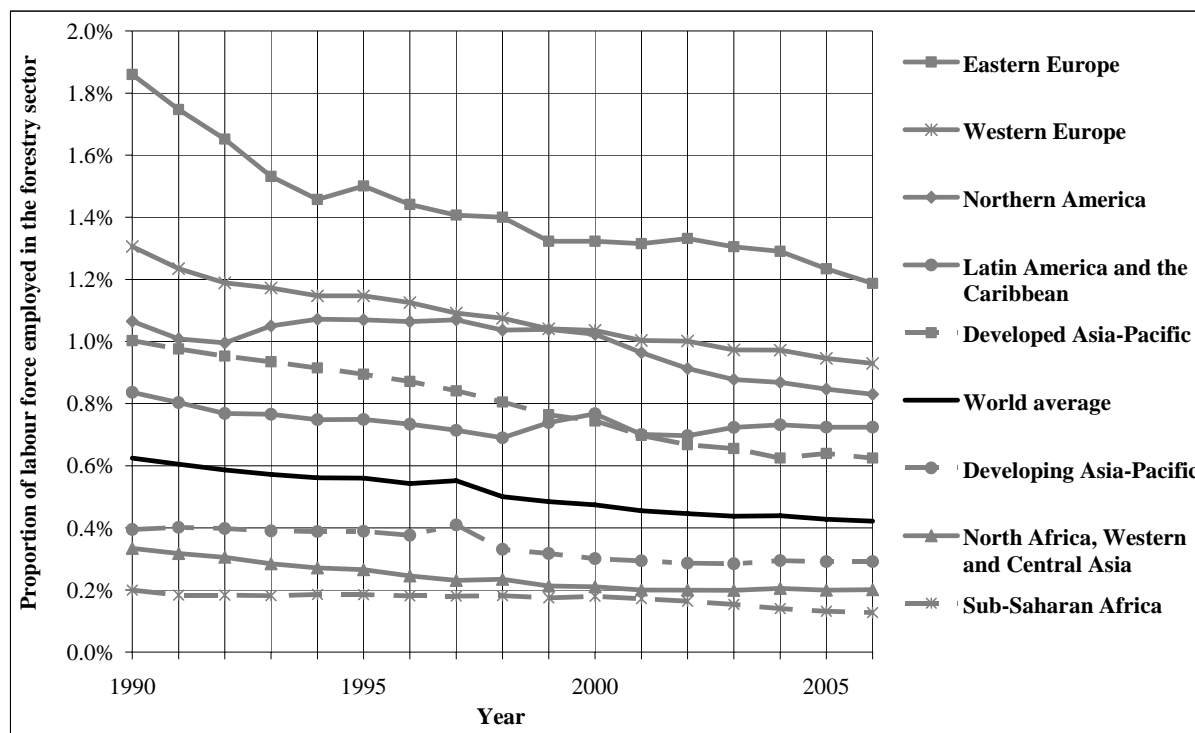

As previously, the highest levels of labour productivity occur in the developed regions (Northern America followed by the Western Europe and Developed Asia-Pacific region). Labour productivity in the other regions is generally at least three times lower than in the developed regions. However, labour productivity in the Latin America and the Caribbean region has increased and there are some countries there (e.g. Chile) that have levels of labour productivity that are comparable with many countries in Western Europe. Eastern Europe experienced a significant drop in labour productivity in the early-1990s, but in later years it recovered and in 2006 it had by 60 percent higher labour productivity as occurred in 1990. Another regions which saw rapid growth in labour productivity during the recent years (up by 30 percent over the period 2000 to 2006) are Sub-Saharan Africa (driven by South Africa) and Developing Asia-Pacific (driven by China and India).

The most interesting trend was the increase in labour productivity achieved by some of the World's largest pulp and paper producer countries. Canada, Indonesia, China, Germany and the Nordic countries all increased labour productivity by 100 percent (or more) over the period 1990 to 2006. In other top producers, United States of America, Japan, Russian Federation and Brazil, labour productivity increased by 30 to 50 percent over the same period. Rise in productivity in developed countries mentioned above led to a loss of 20 percent (or more) jobs in their pulp and paper industry (opposite to developing countries where expanded both production and employment). Globalisation and the creation of large multinational corporations in this sector are resulting in significant investments in capital and new technology, resulting in large increases in labour productivity.

Trends in the forestry sector's contribution to employment

For the purpose of this study, the contribution of the forestry sector to employment was calculated as the number of people employed in the forestry sector divided by the total economically active population (or labour force). Global and regional trends in these figures are shown in Figure 6.

Figure 6 *Forestry sector's contribution to employment by region, 1990-2006*

At the global level, the forestry sector currently employs about 0.4 percent of the total labour force and this figure has declined from 0.6 percent during the period 1990 to 2006. Most of this decline happened during the 1990s, while after 2000 a downward trend flattened, thus, in general, the forestry sector has been able to create new jobs at a rate that has almost kept up with the growth in global population.

At the regional level, employment in the forestry sector has decreased in importance over the period in all of the developed regions (Northern America, Western Europe and the Developed Asia Pacific region) and Eastern Europe. The total labour force has not increased by very much in these regions, so this decline is largely due to the reduction in employment numbers of 2.1 million over the period (a reduction of about 25 percent). In contrast, employment in the (formal) forestry sector in developing countries remained unchanged over the same period. However total labour force grew by 35 percent in these countries, so the contribution of the sector to employment has declined in developing regions too.

The figure also shows that the contribution of the forestry sector to employment varies significantly across the different regions, from 0.1 percent in Sub-Saharan Africa to 1.2 percent in Eastern Europe in 2006. In the developed regions, the forestry sector's contribution to employment is roughly twice the global average. It is also particularly high in Latvia, Finland, Estonia, Czech Republic, Slovenia and Sweden, where the forestry sector directly employs between 2 percent and 5 percent of the total labour force.

The main reason for these regional differences in the importance of the sector is the presence of highly developed forest processing industries in the developed regions. In many developing countries, employment in the forestry sector is concentrated in forestry activities (i.e. industrial roundwood production) and there is little additional employment in the wood industry and pulp and paper industry. Of course, in these countries, there are also probably large numbers of people employed in informal activities. However, these numbers are unknown and the “quality” of this employment is not likely to be comparable with employment in formal activities such as forest processing.

Potential underestimation of employment

As noted previously, the employment figures shown above only include “formal” or “visible” activities in the forestry sector. The ILO (2001a) estimates that, on average, for every one job in the formal forestry sector there are another one or two jobs in the informal forestry sector in late 1990’s (the majority of which are activities related to the production of woodfuel, non-wood forest products in forestry and small-scale wood industries). Unfortunately, since the last ILO’s study, no other comprehensive attempts to estimate global employment in the informal forestry sector were found. Based on this very rough ILO estimate, the global figures of total employment in forestry sector are presented in Table 5. According to this estimate the contribution of the forestry sector to employment could be closer to 1.1 percent at the global level (as opposed to 0.4 percent), with two thirds of the global labour force employed in informal activities.

Table 5 *Estimates of total global employment in the forestry sector in 2006*

Sub-sector	Formal sector employment	Informal and subsistence sector employment	Total employment (formal and informal sectors)	
	millions	millions	millions	% of labour force
Forestry	3.9	11.2	15.1	0.5
Wood industry	5.5	10.8	16.3	0.5
Pulp and paper industry	4.4	n.a.	4.4	0.1
Forestry sector (three sub-sectors above)	13.7	22.0	35.7	1.1
Furniture industry	4.5	8.9	13.4	0.4

Note: n.a. = not available; the figures for formal sector represent official and estimated statistics compiled during this study, and the figures for informal and subsistence sector are derived from the ratio between formal and informal sectors estimated by ILO (2001a).

It should be noted that figures for informal sector employment (Table 5) need to be interpreted with great caution, as they are mere “guesstimates” and should be treated as such (for a comprehensive discussion of this aspect see Poschen, 1997 and ILO, 2001a). Previous FAO (2004a) study also provides more discussion about difficulties in assessing contribution of the forestry sector to employment. In the time available for this study, it was not possible to compile and assess all of the information available about employment in the informal forestry sector. There is probably a large amount of information available about this topic, but it is likely to be contained in numerous reports of small-scale field surveys, with data collected according to a wide range of definitions and measurement units. It would require a substantial effort to compile and synthesise all of this information.

Value-added in the forestry sector

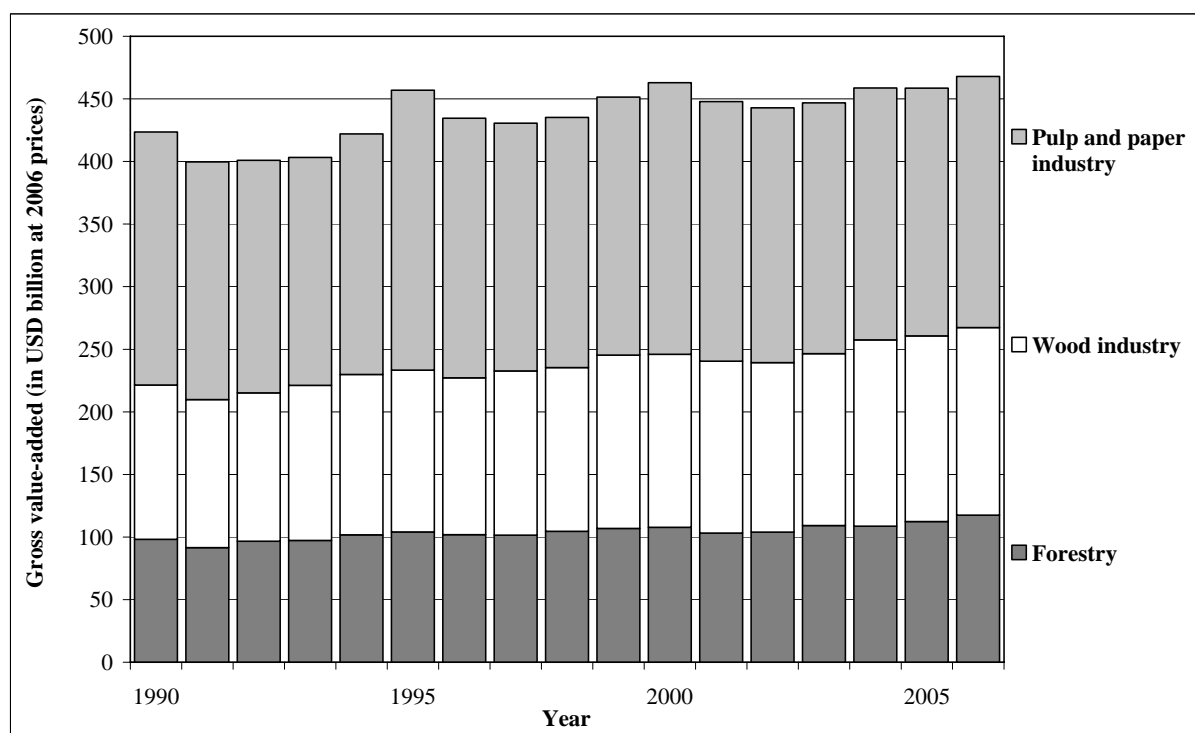

The following section presents the analysis of trends in value-added in the forestry sector. It is important to note that all of these figures have been adjusted for inflation (i.e. converted to real values rather than nominal values) and are expressed in USD at 2006 prices and exchange rates.

Trends in total value-added

Figure 7 shows the global trend in gross value-added in the forestry sector over the period 1990 to 2006. The figure shows that total gross value-added has not changed much during this period, with an average value of USD 438 billion per year (in real terms) and annual figures within +/- five percent of this average. In 2006, total gross value-added in the forestry sector amounted to USD 468 billion.

In addition to this, the value-added in the furniture industry amounted to USD 120 billion in 2006, which is just two percent higher than the figure for 1990. Value-added in furniture declined slightly during early 1990s but in later years recovered to the previous level.

Figure 7 *Gross value-added in the forestry sector by sub-sector, 1990-2006*

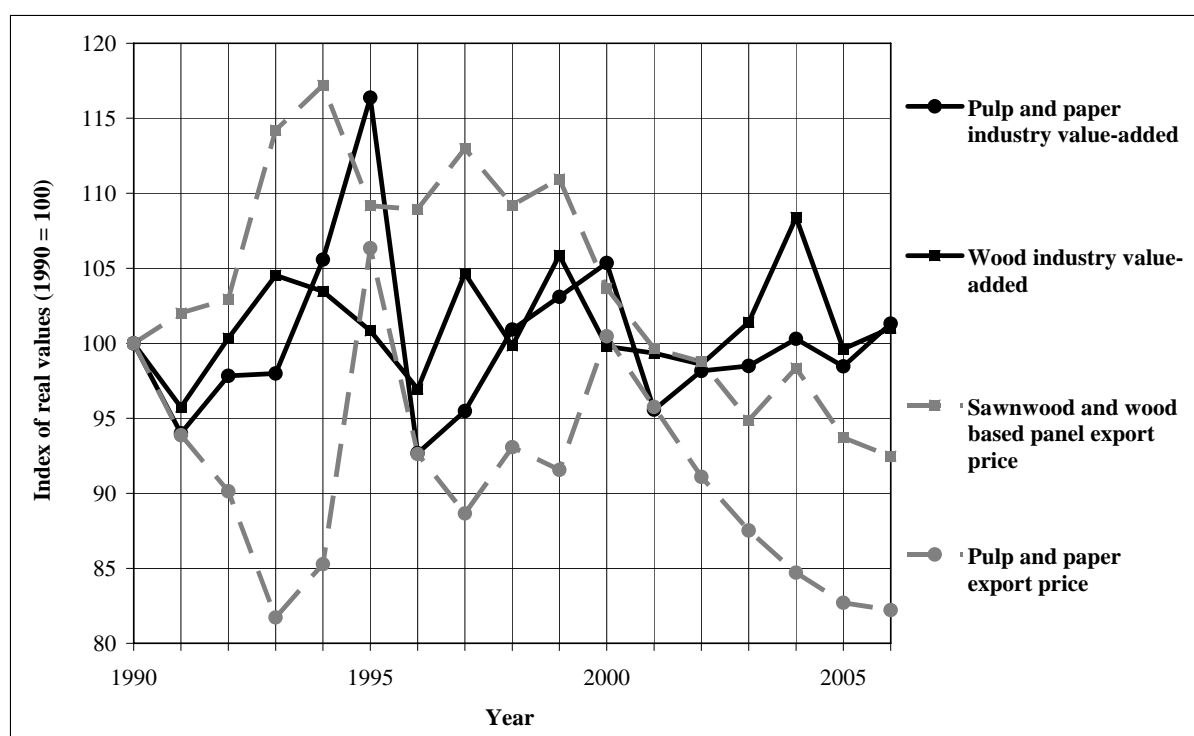

Among the three sub-sectors, the pulp and paper industry makes the largest contribution to GDP, accounting for almost half of the total gross value-added in the forestry sector (average for the period 1990 to 2006). The wood industry is the next largest contributor, with a 30 percent share of the total, while forestry activities account for the remaining 25 percent of gross value-added in the forestry sector. This distribution of the value-added across sub-sectors remained stable in the 1990s; however after 2000 there was a visible change in the distribution: share of pulp and paper industry declined from 47 percent to 43 percent.

This stability in the distribution of value-added across the three sub-sectors is an indication of the strong links between the three sub-sectors. Furthermore, at the global level, changes in the level of value-added in each of the three sub-sectors are strongly correlated with each other from year to year. Thus, for example, in years when the value-added in the pulp and paper industry increased (compared with the previous year) an increase in value-added is also usually recorded in the forestry and wood industry sub-sectors. The simple explanation for this relationship is that changes in supply and demand for processed products lead to changes in product prices, which then lead to changes in industrial roundwood prices. These changes in prices then lead to changes in the value-added in each sector, through their impact on the gross value of output. However, the link between the value-added in pulp and paper industry and other two sub-sectors (forestry and wood industry) has weakened in recent years. Probably, this could be explained by increased ratio of recovered paper used as raw material in paper industry, i.e. decreased reliance on virgin fibre as raw material.

The relationship between product prices and value-added is shown in Figure 8. This figure shows the trends in value-added in the two forest processing sub-sectors over the last ten years, along with the trends in export prices for the products manufactured by those industries over the same period (all adjusted for inflation).

Figure 8 *Real export prices and gross value-added at the global level for the wood industry and pulp and paper industry, 1990-2006*

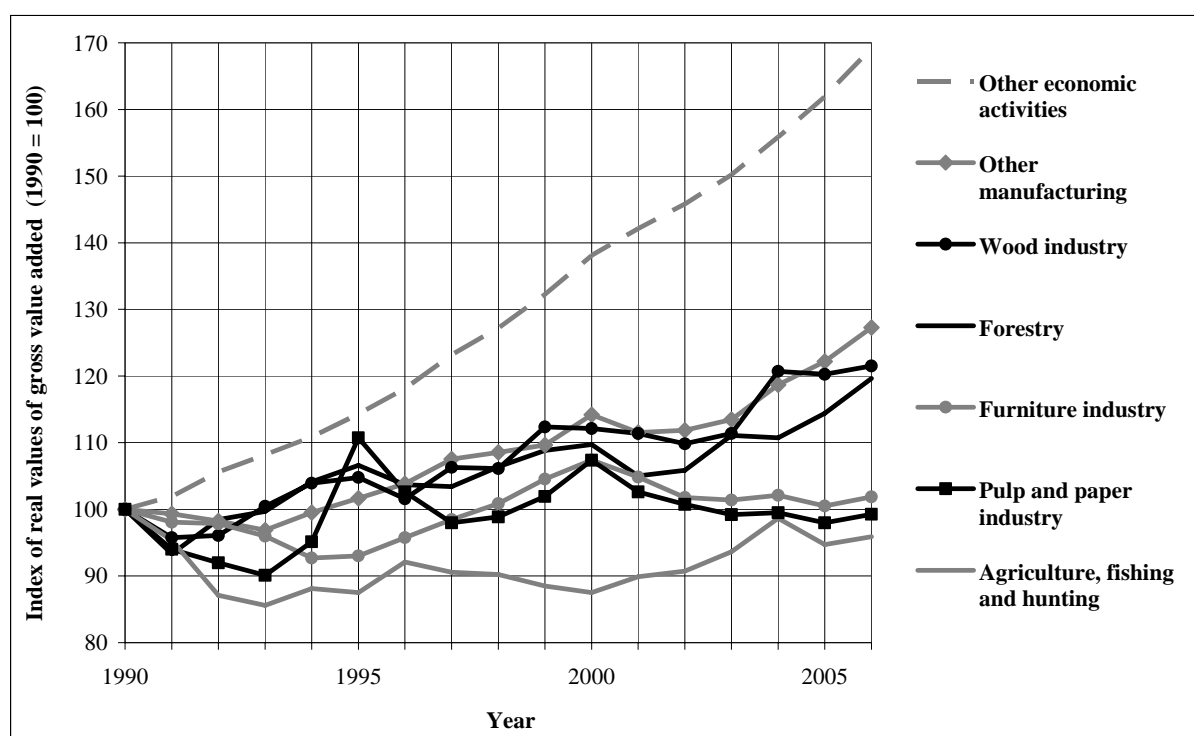

The graph clearly shows that the peaks and troughs in pulp and paper prices over the period are matched by variations in the level of value-added in the pulp and paper industry (e.g. in 1995 and 2000). A similar pattern occurs in the wood industry, where the real level of value-added follows the trend in real export prices for sawnwood and wood based panels (although the correlation is not as strong). It is also likely that value-added in the forestry sub-sector is

correlated with roundwood prices, but this could not be explored in the analysis because of the difficulty of producing reliable and realistic trends in roundwood prices.¹⁵

Figure 9 clearly shows that global economic growth (GDP) was mainly driven by increased value added in economic activities other than agriculture and manufacturing. Value-added in these activities (services, wholesale and retail trade and others) increased by 70 percent over the period 1990 to 2006 (in real prices). Growth in value-added by total manufacturing including wood, pulp and paper and furniture industries was 25 percent while in agriculture, forestry and fishing value-added has declined by three percent during the same period.

Trends in different sub-sectors of the forestry sector are diverse. Forestry sub-sector with growth in value-added by 20 percent clearly outperformed flat trend in value-added in agriculture and fishing. Value-added in wood industry sub-sector grew similarly like other manufacturing activities over the period 1990 to 2006. While value-added in pulp and paper industry and furniture industry remained flat, opposite to the growth in whole manufacturing. The latter industries were the ones which experienced highest degree in the relocation of production capacities to the countries with cheaper labour, raw materials and/or abundant forest resources.

Figure 9 *Gross value-added at the global level for the forestry sub-sectors and other economic activities, 1990-2006*

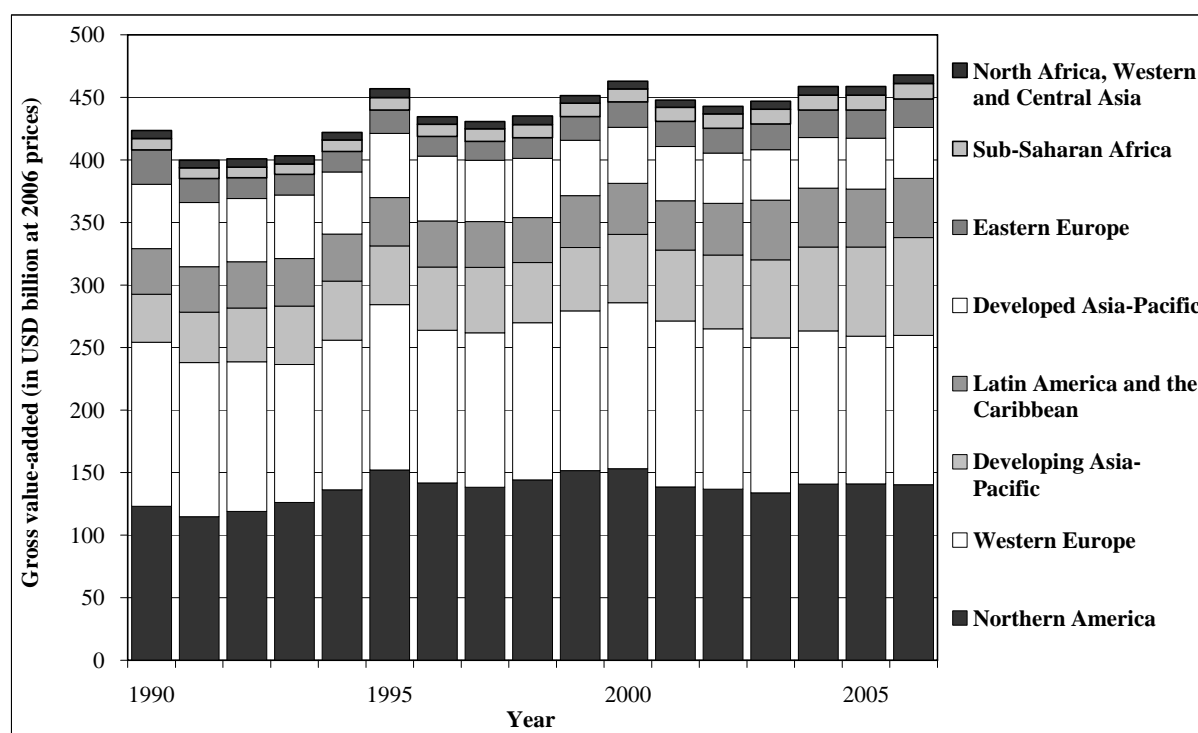

Note: "Other manufacturing" comprise Manufacturing (ISIC Section D) other than Wood industry (ISIC Division 20), Pulp and paper industry (ISIC Division 21) and Furniture industry (ISIC Class 3610); "Other economic activities" comprise all activities other than Agriculture, hunting and forestry, Fishing and Manufacturing (ISIC Sections A, B and D)

¹⁵ It is possible to produce trends in export prices for roundwood from FAO trade statistics. However, international trade in roundwood accounts for a very small proportion of total roundwood production, so such trends do not give a reliable or representative picture of the trends in prices for all roundwood production.

Recent trends in the regional distribution of value-added in the forestry sector are shown in Figure 10. In 2006, the developed regions (Northern America, Western Europe and the Developed Asia-Pacific region) accounted for 70 percent of the gross value-added in the global forestry sector. However, their share has gradually decreased from about 80 percent in the early-1990s.

In contrast, the rapid growth of forest-based industries in Latin America and the Caribbean and particularly the Developing Asia-Pacific regions has resulted in a real increase of 70 percent in their gross value-added in the forestry sector over the period 1990 to 2006. Consequently, their share of the global total has also increased from 18 percent in 1990 to 27 percent in 2006.

Figure 10 Gross value-added in the forestry sector by region, 1990-2006

Within the three developed regions, there are significant differences in the trends in value-added at the country level. In Canada and the United States of America, value-added in the sector has increased by 25 percent during 1990s, however after 2000 it declined by 10%, i.e. back to mid-1990s level. Value-added in the forestry sector has remained constant in the Nordic countries (as a group). In the rest of Western Europe, value-added in the forestry sector has declined by 15 percent, mainly due to a significant fall in some major economies: United Kingdom, France, Italy, and Spain. However, there has been strong and consistent growth in value-added in some other countries, such as: Austria, Denmark and Germany.

The trends for countries in the Developed Asia-Pacific Region are also very different. Value-added in the forestry sector in Australia and New Zealand has increased by 20 percent over the period 1990 to 2006, while it has fallen by 27 percent in Japan. Due to the relatively large size of the Japanese economy, this fall accounts for the 20 percent decrease in value-added for the region as a whole.

Two regions - Eastern Europe and Sub-Saharan Africa - account for only eight percent of the value-added in the forestry sector at the global level. However, these two regions altogether account for about 40 percent of the global forest area. This suggests that the forestry sector in these countries has the potential to make a much greater contribution to the economy.

In Eastern Europe, value-added in the forestry sector fell in nearly all countries in the early-1990s as these countries started the process of transition from centrally planned to market economies. Since the mid-1990s, the forestry sector has recovered in many of these countries and value-added has started to grow very rapidly. Eastern European countries in the Commonwealth of Independent States (CIS)¹⁶ have been slower to recover, although recovery in the Russian Federation started at the end of the 1990s and has led to more rapid growth in value-added in the forestry sector in recent years. Economies of most other Eastern European countries (non-CIS members) recovered faster than CIS countries after the steep decline in early 1990s; and by 2006 value-added in their forestry sector was by about 10 percent higher than in 1990.

Value-added in the forestry sector in Sub-Saharan Africa has increased by 40 percent over the period 1990 to 2006 but remains insignificant at the global level (three percent). South Africa accounts for about 30 percent of value-added in the forestry sector of this region. In addition, the forestry sector in North Africa, Western and Central Asia accounts for only one percent of value-added in the forestry sector at the global level. Due to the relative scarcity of forest resources in North African, Western and Central Asian countries, it seems likely that the forestry sector will continue to remain quite unimportant to the economies of this region.

Trends in value-added by sub-sector

In addition to the trends noted above, there are also differences between the regions in terms of the composition of value-added in forestry sector. In developed countries and Eastern Europe, the wood industry and pulp and paper industry account for 80 percent to 90 percent of the total value-added in forestry sector, but in Sub-Saharan Africa these industries account for only 30 percent of the total. In Developing Asia-Pacific, Latin America and the Caribbean and North Africa, Western and Central Asia, the share of forestry sector value-added in processing industries is somewhere between the figures mentioned above (50 percent to 70 percent in 2006).

The distribution of value-added amongst the three sub-sectors has remained quite stable in most of the regions over the period 1990 to 2006. However, the two major exceptions are Eastern Europe and Developing Asia-Pacific. In Eastern Europe value-added in forestry activities has increased at the same time as value-added in the sector as a whole has declined during the 1990s (i.e. the relative importance of the forest processing industries has declined, as factories have closed and some of these countries have focused more on industrial roundwood production). After the late 1990s the share of forestry in value-added of the forestry sector in Eastern Europe started to decrease due to growing investment and expansion of capacities in forest processing industries. Expansion of forest processing facilities in Developing Asia-Pacific led to consistent growth in value-added therefore the share of forestry sub-sector in the sector's gradually decreased from 60 percent to 40 percent over the period 1990 to 2006.

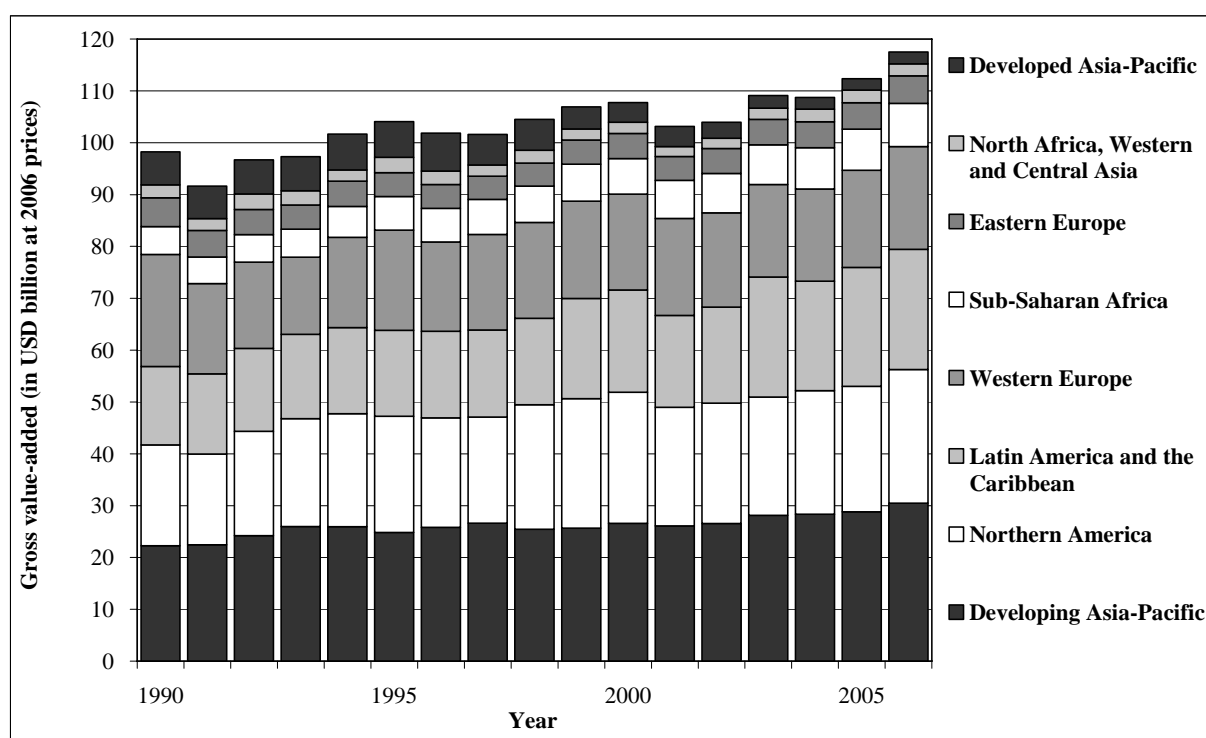

¹⁶ Belarus; Moldova; Russian Federation; and Ukraine.

The distribution of value-added amongst the three sub-sectors is an indication of the general level of development in the forestry sector in countries. A few developing countries have made the transition from a forestry sector where much of the value-added occurs from industrial roundwood production to a situation where a significant share of value-added occurs in the processing sector (e.g. China and Chile). However, the stability noted above indicates that most developing countries have generally not been successful at creating significant processing industries that can achieve a relatively high level of value-added.

The trends in forestry sector development in regions can be examined by looking at the trends in the distribution of value-added across regions for each sub-sector separately and these are shown in the following three figures.

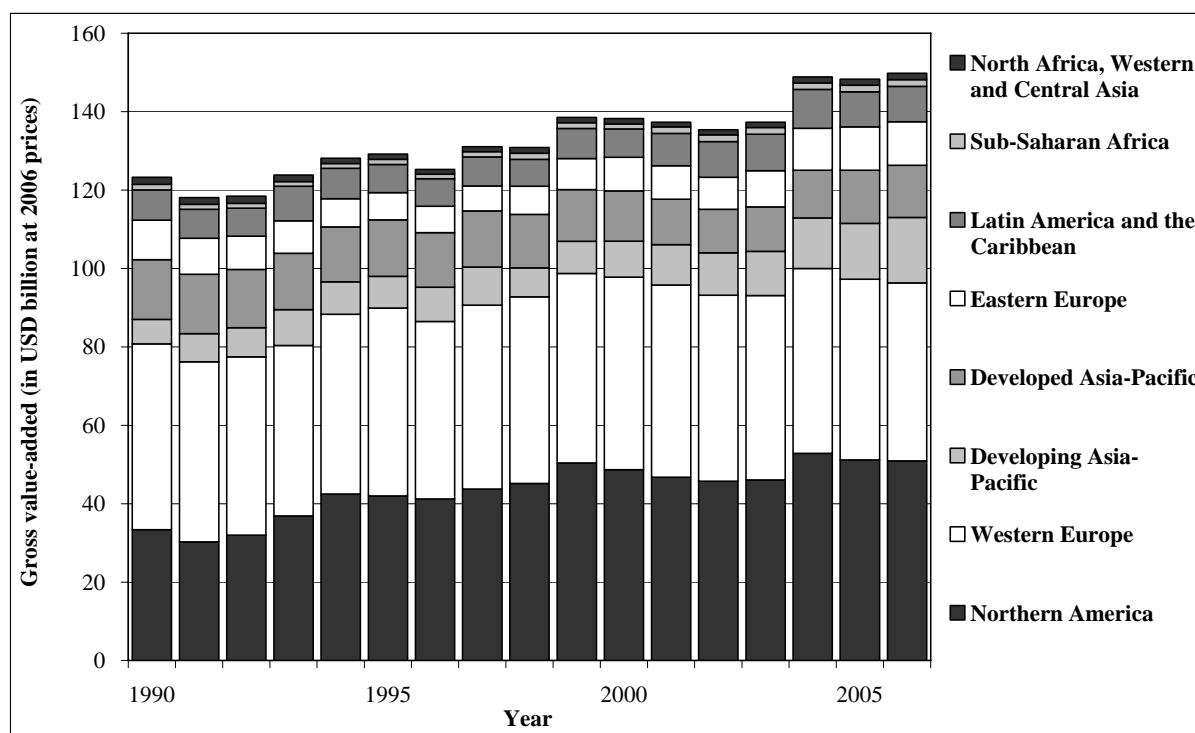

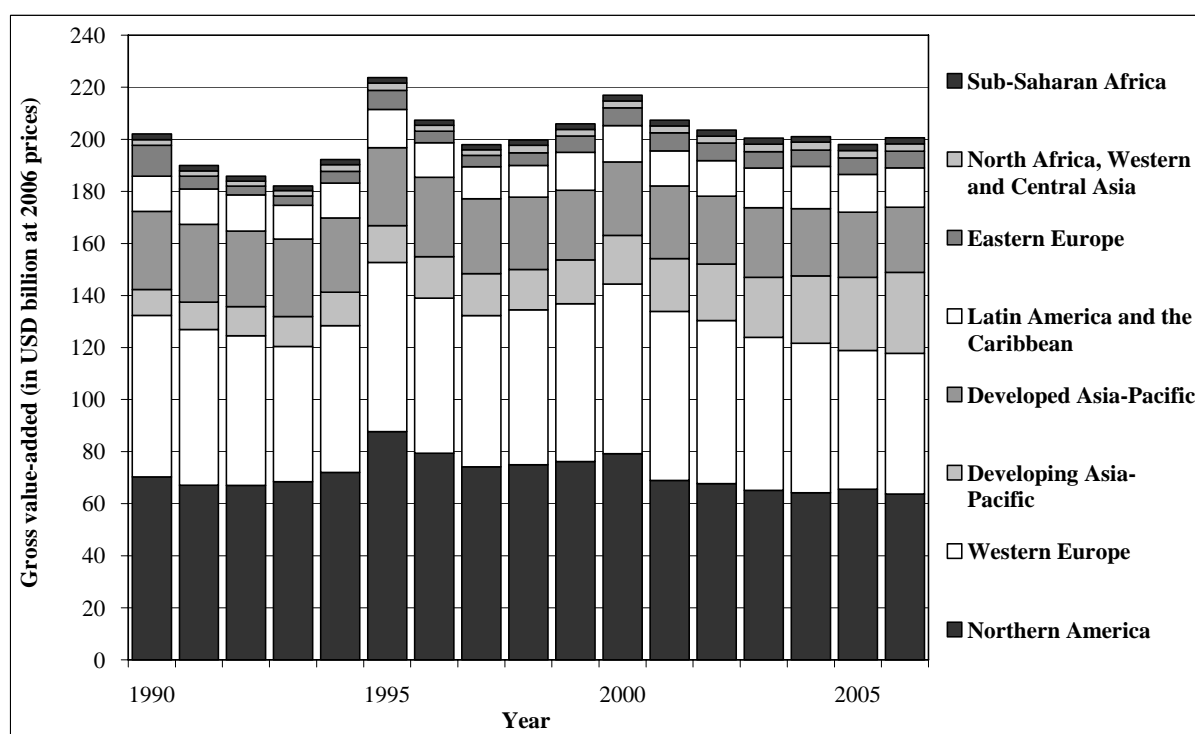

Figure 11 shows the trends in value-added in (formal) forestry activities in regions and at the global level since 1990. This shows that value-added has increased by 20 percent over the period. However, at the same time, global industrial roundwood production has declined by four percent (FAO, 2008a). This indicates that the value-added per m³ has increased (in real terms) over the period (see below for further discussion of trends in productivity).

Figure 11 Gross value-added in (formal) forestry activities by region, 1990-2006

At the regional level, value-added in (formal) forestry activities has increased or remained stable in most regions and countries except Japan.¹⁷ It is also worth noting that the distribution of value-added across regions is much more even than in the other two sub-sectors, showing how this part of the forestry sector is relatively more important in developing regions.

¹⁷ Note that the sharp fall in value-added in Western Europe between 1990 and 1991 is probably due to the very high level of roundwood production in 1990, due to storm damage. Excluding this, value-added has remained slightly increased in Western Europe over the period 1991 to 2006. Furthermore, excluding the effect of this, the global trends would indicate a larger increase than the 20 percent quoted above.

Figure 12 *Gross value-added in the wood industry by region, 1990-2006***Figure 13** *Gross value-added in the pulp and paper industry by region, 1990-2006*

Value-added in the wood industry has increased. There is clear trend upwards in this sub-sector (see Figure 12). Developed countries account for about 75 percent of the total value-added in the wood industry, although this share decreased slightly during the 1990s (largely due to the decline in Japan and growth in China). This distribution of value-added across

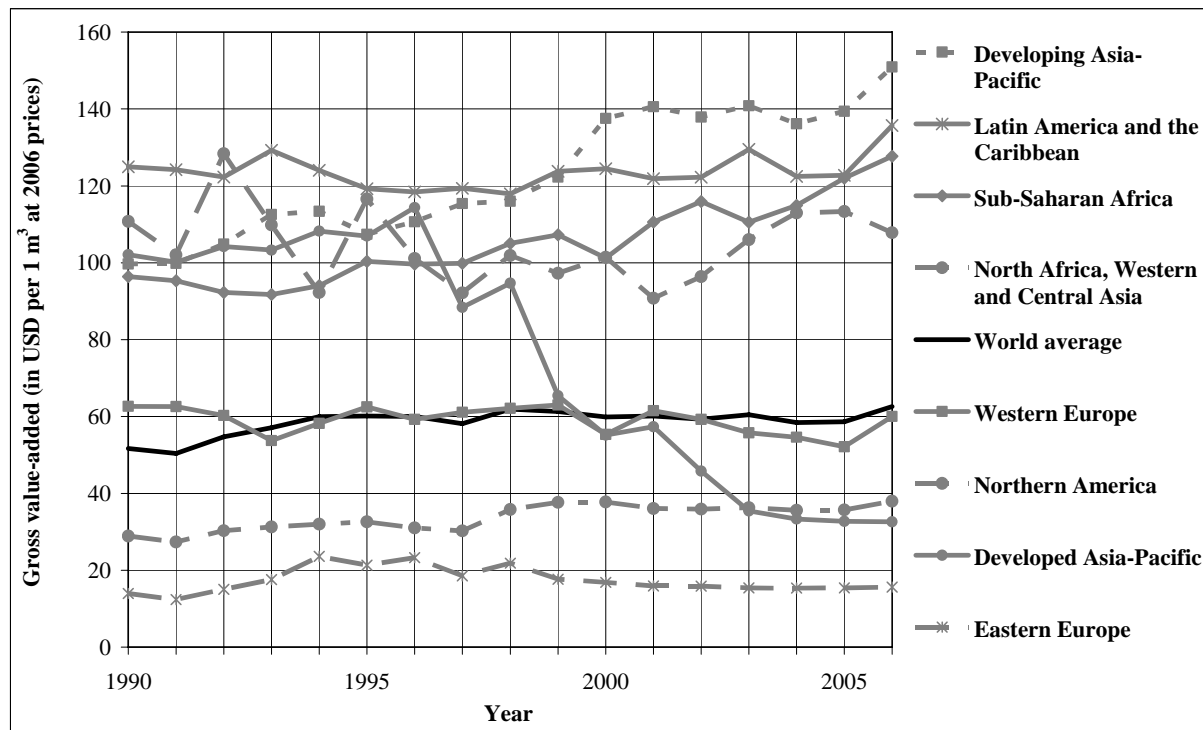

regions shows that developing countries have not yet created a wood industry that can achieve high levels of value-added. However, the Latin America the Caribbean and Developing Asia-Pacific regions have started to develop rapidly, increasing their share of global value-added in the wood industry from 11 percent in 1990 to 17 percent in 2006.

Figure 13 shows the trends in value-added in the pulp and paper industry since 1990. Overall, value-added at the global level has remained roughly the same, but has fluctuated in line with changes in pulp and paper prices. The three developed regions account for about 70 percent of value-added in this sub-sector, but their share has declined sharply during the last years (during 1990s developed countries accounted for 80 percent of value-added in pulp and paper industry at the global level). In contrast, the Latin America and the Caribbean and Developing Asia-Pacific regions have almost doubled their share of global value-added from 12 percent to 23 percent over the period 1990 to 2006.

Trends in value-added per unit of output

Another indicator of the level of development in the forestry sector is the value-added per unit of output. This has been calculated by taking the value-added figures presented earlier and dividing them by the production statistics for each sub-sector recorded in the FAOSTAT database. The following text presents the trends in these figures for each of the three main components of the forestry sector.

Figure 14 *Value-added per unit of output in (formal) forestry activities by region, 1990-2006*

Note: for Northern America, Western and Eastern Europe and the Developed Asia-Pacific regions, these figures are value-added per m³ of roundwood production. For the other regions, the figures are value-added per m³ of industrial roundwood production.

Figure 14 shows the trends in value-added per unit of output in the forestry sub-sector (ISIC Division 02) from 1990 to 2006 at the global and regional levels. These figures are all expressed in USD per m³, at 2006 prices and exchange rates (i.e. adjusted for inflation). At the global level, the value-added per m³ of production increased during the early-1990s by just under 20 percent and has remained stable since then.

The first point to note about these figures is that the value-added per m³ is higher in tropical countries than in temperate countries. This is probably due to the considerably higher prices paid for tropical roundwood compared to the roundwood produced from temperate and boreal species (which also contain a much higher proportion of lower-valued pulpwood production).

Regarding the trends in these figures, value-added per m³ has increased in Sub-Saharan Africa, Latin America and the Caribbean and Developing Asia-Pacific regions.¹⁸ In temperate and boreal countries, the value-added per m³ has increased in Northern America and Eastern Europe and remained roughly the same in North Africa, West and Central Asia. The major exceptions to these trends has been New Zealand, Australia and Western Europe (including the Nordic countries) where value-added per m³ has fallen by about five percent. For Western Europe, this is most likely the result of falling roundwood prices in this region due to increased competition (i.e. relatively cheap roundwood and processed products imports) from Eastern Europe.

Figure 15 Value-added per unit of output in the wood industry by region, 1990-2006

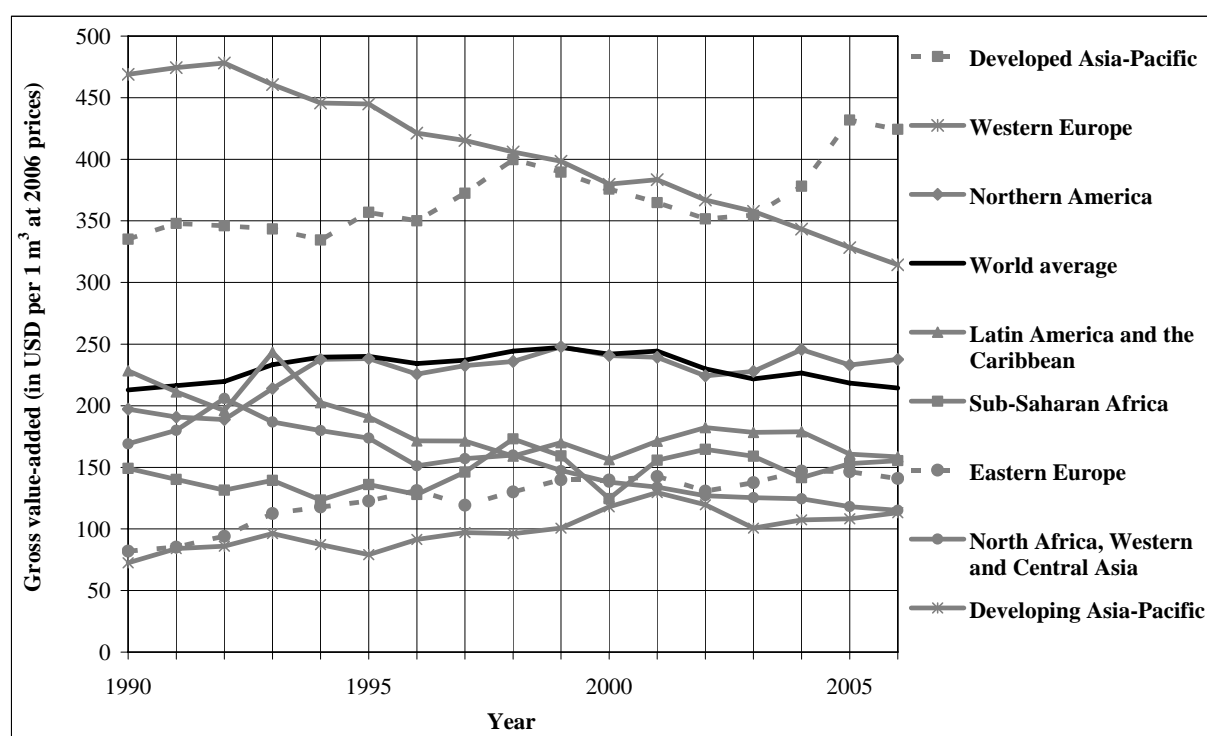

Figure 15 shows the recent trends in value-added per unit of output for the wood industry (i.e. sawnwood and wood based panel production). At the global level, there was a slight upward

¹⁸ The trends for the two Asia-Pacific regions are highly influenced by the trends for China and Japan. Excluding these countries, the trend for the Developing Asia-Pacific region would show less of an increase than shown here and the trend for the Developed Asia-Pacific region would be flat rather than the sudden decline after 1996.

trend in these figures during the 1990s, indicating that value-added per m³ has increased by just under 10 percent. However, during the later years this figure bounced back to the level of early 1990s. A significant increase is shown for the Northern America and Eastern Europe, Developing and Developed Asia-Pacific regions. Trend for Sub-Saharan Africa is flat. A falling trend is shown for the Latin America and the Caribbean, and, in particular, Western Europe and North Africa, Western and Central Asia.

In the case of the wood industry, it is also worth noting that the developed regions have a much higher value-added per m³ than developing regions. This is because most of the products manufactured by the wood industry in these countries is sold in domestic markets or traded with other developed countries, where product prices are generally high. Again, in Europe, increased trade between Western and Eastern Europe partly explains why value-added has fallen in the former region and increased in the latter (i.e. prices are converging). However, it is notable that value-added per m³ in Eastern Europe is still considerably lower than in every other developed region (e.g. by about 50 percent lower than in Western Europe). This may be due to the levels of technology currently used in much of the wood industry there (i.e. resulting in relatively high production costs compared with product prices).

There are different probable explanations for diverse trends amongst developing regions. In Latin America and the Caribbean production the product mix has changed. In this region the share of reconstituted panels (particleboard and fibreboard) and softwood plywood which are generally cheaper than other products (e.g. tropical sawnwood and plywood) has increased therefore value-added per unit of output declined. The decline in value-added per unit of output in North Africa, Western and Central Asia was mainly due to ceased production in Commonwealth of Independent States (CIS)¹⁹ during early 1990s where raw material imports from Russian Federation discontinued and domestic supply was replaced with imported products. Overall, it is likely that many developing countries due to gradual improvements in technology have reduced production costs and, more importantly, led to some increases in product prices through product improvement and expansion of exports. It is also possible that local market prices have increased in some of these countries due to their high levels of economic growth.

In the pulp and paper industry, a strong and significant downward trend in value-added per tonne has occurred over the period from 1990 (see Figure 16). Furthermore, this trend appears at the global level and in all regions with the Developing Asia-Pacific being an exception. Over the period 1990 to 2006, value-added declined by 30 percent or about USD 150 per tonne (in real prices), which is very similar to the decline in average world trade price (average price of imports and exports) for pulp and paper over the same period (a decline of about 20 percent or USD 160 per tonne in real prices).

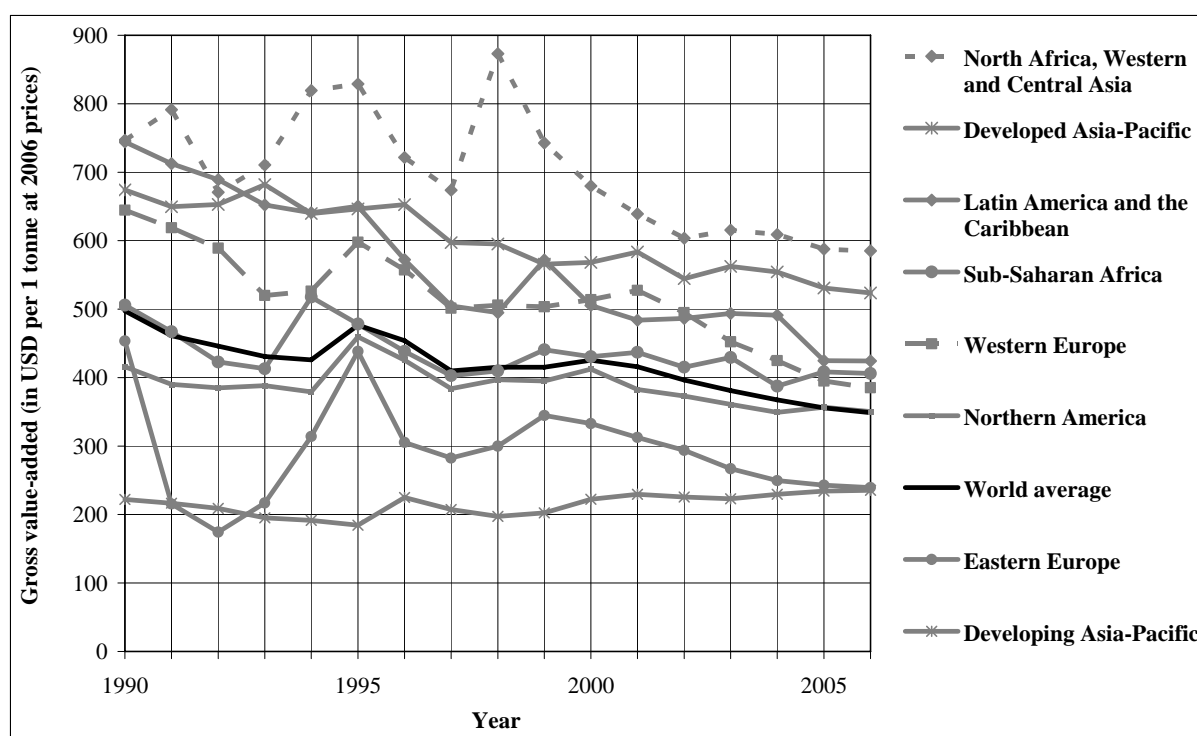

At the regional level, the order of regions (in terms of value-added per tonne) is very different to the other two sub-sectors. In North Africa, Western and Central Asia value-added per tonne is highest because of high proportion of paper and further processed paper products in production (main raw materials are recovered paper, imported pulp and primary paper products). Value-added per tonne is also very high in the Developed Asia-Pacific region due to the high level of value-added in Japan (where most paper is sold in the domestic market for high prices and the very high level of technology used in the sector has led to relatively low

¹⁹ Armenia; Azerbaijan; Georgia; Kazakhstan; Kyrgyzstan; Tajikistan; Turkmenistan; and Uzbekistan.

production costs). Value-added in the Latin America and the Caribbean region is also high, due to the significant level of industry development in some countries in this region (e.g. Brazil, Mexico and Chile). The figures for Northern America are somewhat lower than might be expected, but this reflects the high proportion of pulp production (which generally results in lower value-added per tonne) in these figures. The figures for Sub-Saharan Africa are also relatively high compared with other regions, but they are dominated by the figures for South Africa where the pulp and paper industry is comparable (in terms of markets and technology) to many developed countries.

Pulp and paper industry in Northern America and Western Europe are facing the biggest difficulties – value-added per tonne of pulp and paper has contracted by 20 percent in these regions over the period from 2000. Recent numerous announcements by the leading multinational companies about restructuring, mergers and acquisitions, divestments and closure of plants and confirm. Interesting changes are also noticeable on the bottom lines of the graph over the last years– in Eastern Europe value-added per tonne is declining (due to the lack of investments in new technologies) while value-added per tonne in Developing Asia-Pacific is consistently increasing and already reached the level of Eastern Europe (mainly because of the rapid growth in China).

Figure 16 *Value-added per unit of output in the pulp and paper industry by region, 1990-2006*

The other interesting feature of Figure 16 is that the gap in value-added per tonne in different the regions is shrinking and moving towards the global average. This convergence is another indication of the globalisation of the pulp and paper industry, where products are often marketed at the global level, high levels of technology are used throughout much of the World and multinational corporations account for a major share of global production.

Trends in value-added per employee

In addition to the amount of output per employee, another measure of labour productivity is the value-added per employee (also called *apparent productivity*). This has been calculated by taking the gross value-added for each sub-sector and dividing this by the employment numbers presented earlier.

The value-added per employee is one factor that underlies the level of salaries and wages in an industry. Therefore, it is another general indicator of the contribution of the forestry sector to society (i.e. in as much as it reflects the general level of benefits and conditions of employment in the sector). However, it should be noted that a high level of value-added per employee also usually reflects a high level of capital and technology utilisation in an industry. In such cases, a significant proportion of this value-added is required to cover the costs of capital, so the share of value-added paid to labour may be relatively low.

At a very broad level, the value-added per employee in the forestry sector as a whole roughly increased by 30 percent from 1990, and stood at around USD 34,000 per employee in 2006 (at 2006 prices and exchange rates). However, the figures vary widely between regions and between the three sub-sectors of the forestry sector.

Value-added per employee is highest in Northern America (USD 101,000), Developed Asia-Pacific (USD 82,000) and Western Europe (USD 70,000) and lowest in Eastern Europe (USD 11,000) and Developing Asia-Pacific (USD 15,000). Over the period 1990 to 2006, value-added per employee has increased in absolutely all regions: by 10 percent to 20 percent in the Latin America and the Caribbean, North Africa, Western and Central Asia, Developed Asia-Pacific, Northern America, and Western Europe. Other regions experienced more rapid growth (although from the low base) – Eastern Europe and Sub-Saharan Africa by 30 percent to 40 percent, while apparent productivity in the Developing Asia-Pacific more than doubled from 1990.

It is also important to note that in all regions except the Latin America and the Caribbean, total employment in the forestry sector has declined. This suggests that capital has replaced labour in the forestry sector in most of these countries (e.g. due to greater mechanisation of forest operations and the adoption of new processing technologies). In contrast, only in the Latin America and the Caribbean where value-added per employee has increased also, both employment and value-added have tended to increase together. This suggests that such countries have been successful at increasing labour productivity by improving human capital (e.g. through better training and working practices).

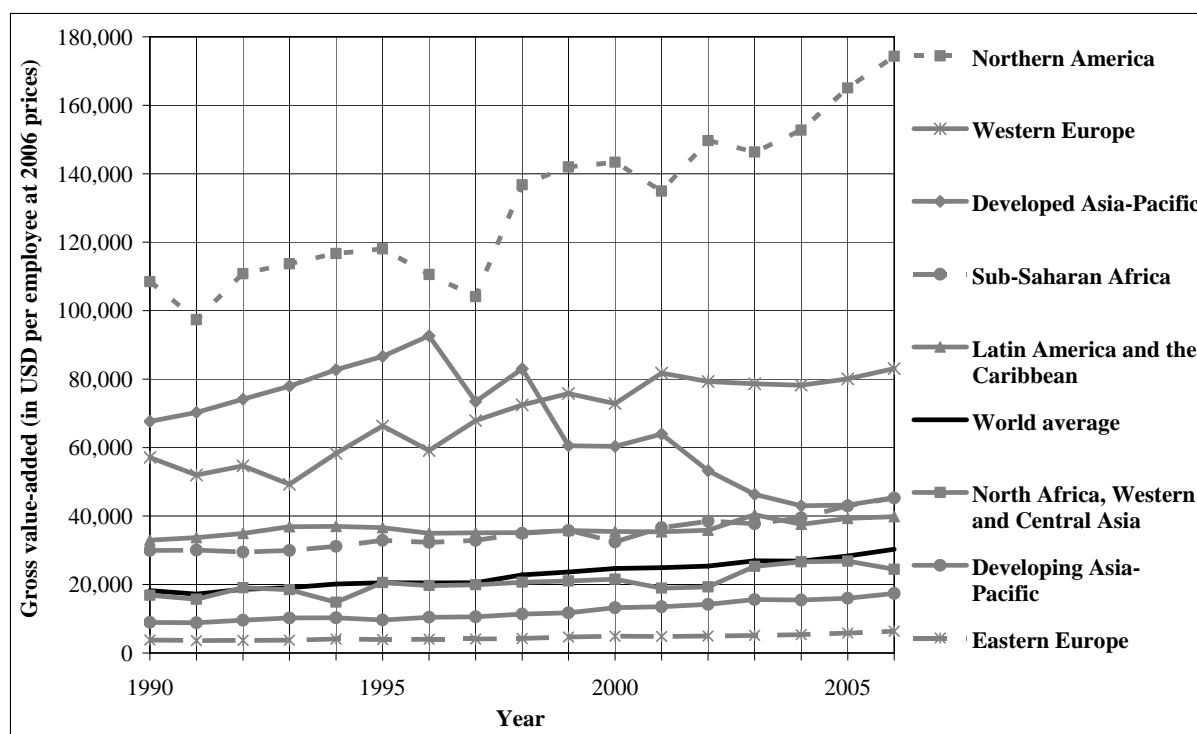

For each of the three sub-sectors of the forestry sector, the global average level of value-added per employee in 2006 was as follows:

- Formal forestry activities: USD 30,000 (real increase of 66 percent since 1990)
- Wood industry: USD 27,000 (real increase of 30 percent since 1990)
- Pulp and paper industry: USD 46,000 (same as in 1990 but down by 10 percent since 2000)

In addition to the above, average value-added per employee in the furniture industry in 2006 was at about USD 26,000 (decrease by 3 percent and 15 percent over the periods from 1990 to 2006 and from 2000 to 2006, respectively).

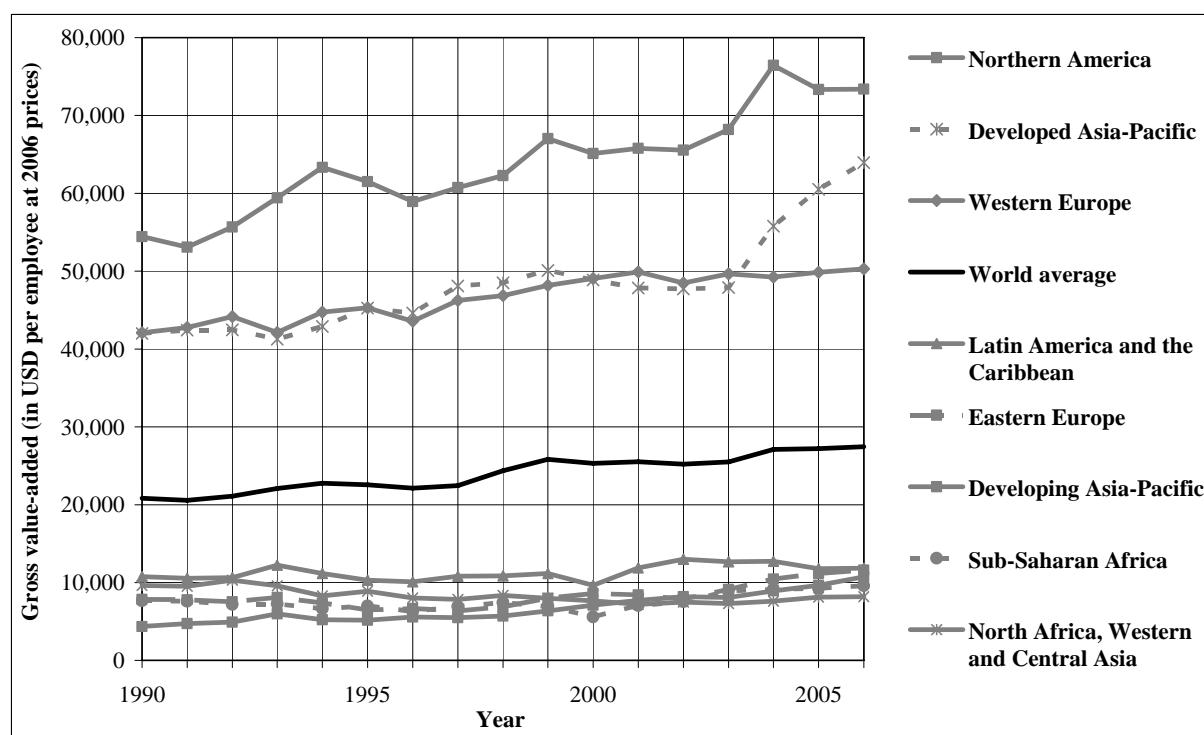

These differences are reflected in the wage levels in the three sub-sectors, where jobs in forestry are generally not well-paid, while jobs in the two forest processing sub-sectors are generally comparable to wage levels in similar manufacturing industries. A more detailed description of recent trends at the level of the individual sub-sectors is given in the text below.

Figure 17 *Value-added per employee in (formal) forestry activities by region, 1990-2006*

In the (formal) forestry sub-sector at the global level, value-added per employee has been continuously growing by over the period from 1990 to 2006 (see Figure 17). There are two main reasons for explaining this almost 70 percent in value-added per employee over the period (logging volume was at the same level in 1990 and 2006). Firstly, labour productivity (output in m^3 per employee) has increased by 40 percent, and, secondly, the value-added has grown by 20 percent over this period (probably as a result of higher roundwood prices).

At the regional level, value-added per employee has significantly increased all regions except Developed Asia-Pacific. Figures for the latter region are highly influenced by Japan where forestry was on a large decline in terms of logging volumes, employment and value added since mid-1990s. Value-added per employee in forestry in other two countries in the region, Australia and New Zealand, has grown similarly as in other developed regions. The differences between regions in the level of value-added per employee largely reflect the much higher levels of output (in m^3) per employee in developed countries (due to mechanisation of operations) rather than the levels of value-added per m^3 .

Figure 18 *Value-added per employee in the wood industry by region, 1990-2006*

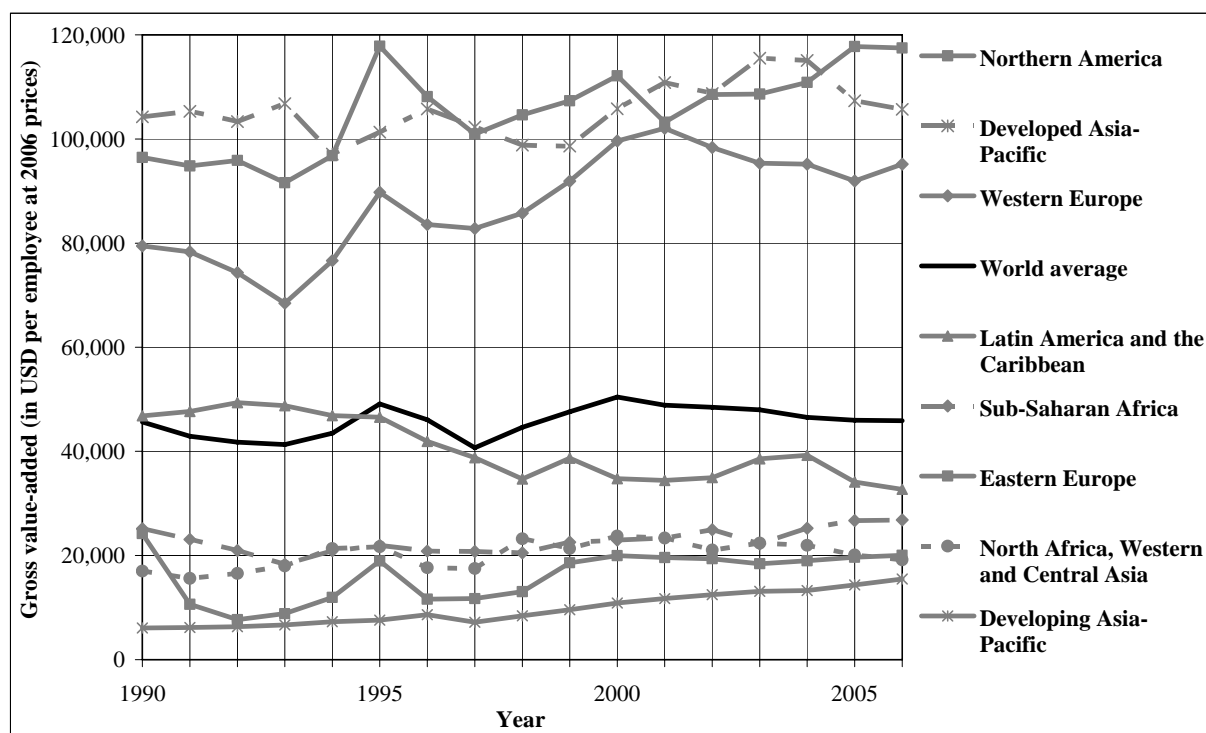

In the wood industry, trend in value-added per employee has been flatter than in forestry, although a steeper upward trend appears from late 1990s, particularly for developed regions. The three developed regions have a very high level of value-added per employee due to both a high level of output (in m³) per employee and relatively high levels of value-added per unit of output (in USD per m³).

In the pulp and paper industry, the value-added per employee has fluctuated significantly during the 1990s; however from 2000 apparent productivity was declining steadily at the global level (see Figure 19). There have been two opposing trends in this industry sub-sector. First, the average level of value-added per unit of output has gradually declined over the period, due to falling pulp and paper prices. Secondly, the productivity per employee (in tonnes) has increased over the period.

The latter trend is probably partly due to the former trend. Declining prices and value-added per tonne has encouraged companies to expand the scale of production (e.g. by building large new mills in Asia and Latin America and cutting existing capacities in Northern America and Western Europe over the last years), to gain economies of scale, cut production costs and increase productivity per employee (in tonnes). Thus, the industry has generally been able to remain competitive in an environment of falling prices.

At the regional level, the trends are generally similar to the global trend, although value-added per employee in Northern America has risen substantially over the period due to the declining employment in the sector and increased production per employee (in tonnes) as a result of this. Value-added per employee in Developing Asia-Pacific is consistently growing (mainly due to the expansion of China's pulp and paper industry). As with the wood industry, value-added per employee is highest in the developed regions, due to both the relatively high productivity per employee (in tonnes) and the high level of value-added per unit of output.

Figure 19 *Value-added per employee in the pulp and paper industry by region, 1990-2006*

Trends in the forestry sector's contribution to GDP

In spite of the slight increase of value-added in the forestry sector, the contribution of the sector to GDP has declined from just over 1.4 percent in 1990 to just over 1.0 percent in 2006 (see Figure 20). In addition to this, the furniture industry contributed a further 0.3 percent to the global GDP in 2006.

This decline has occurred because the global economy has expanded (i.e. global GDP has increased by almost 60 percent over the period 1990 to 2006) while value-added in the forestry sector has increased by 10 percent only. At the regional level, absolutely all regions display the same downward trend.

Among the regions, the forestry sector's importance is highest in Sub-Saharan Africa where it accounts for about two percent of GDP. However the contribution of the forestry sector to GDP in the region was declining during the last years.

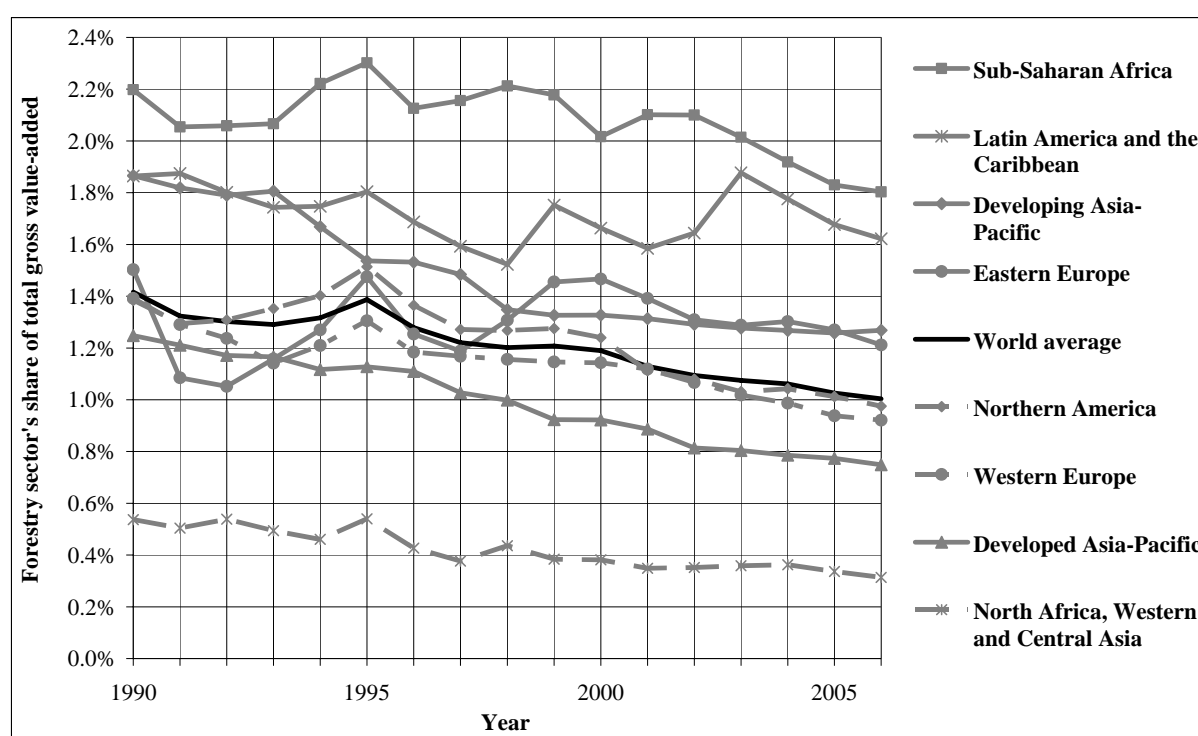

At the individual country level, 17 countries (out of a total of 51 countries and territories in the Sub-Saharan Africa) report that the forestry sector accounts for three percent (or more) of GDP in 2006. In addition to this, subsistence production in Africa is of particular significance to many people in rural areas. If national accounts statistics included activities in the informal or non-monetary sector, it is likely that the forestry sector's share of GDP would probably be at least twice what is reported in official statistics.

In Latin America and the Caribbean, the forestry sector's contribution to GDP was fluctuating in different years and, over the whole period; it has decreased from about 1.9 percent in 1990 to almost 1.6 percent in 2006.

High economic importance of the sector in this region is largely due to significant developments in Brazil, Chile and Mexico, which together account for about 80 percent of the total value-added in the forestry sector in this region. Value-added in the forestry sector grew by about 30 percent in these three countries over the period 1990 to 2006, indicating that the forestry sector has been an important source of economic growth in these countries.

At the country level, it is also worth noting that the forestry sector is particularly important in Guyana, Paraguay, Brazil, Bolivia, and Chile, where it accounts for more than 2.5 percent of GDP.

Figure 20 *Forestry sector's contribution to GDP by region, 1990-2006*

Note: total gross value-added is approximately equal to GDP.

The other two regions where the forestry sector is important are Developing Asia-Pacific region and Eastern Europe (including the Russian Federation). The contribution of the forestry sector to GDP has gone down in these two regions (due to higher rates of growth in value-added in other sectors), but the economic contribution of the sector in these regions remains higher than the global average.

The forestry sector's contribution to GDP in the Developing Asia-Pacific region declined from 1.9 percent to 1.3 percent during the period 1990 to 2006. Value-added in the forestry sector has doubled since 1990 but, at the same time, the economies of these countries have tripled (in the region as a whole). Thus, the forestry sector has been left behind as these countries have achieved phenomenal rates of economic growth.

In the Developing Asia-Pacific region, the forestry sector is most important in some of the smaller countries (e.g. Solomon Islands and Bhutan, where it accounts for than 17 percent and seven percent of the economy, respectively). Of the larger countries, the forestry sector is also important in: Papua New Guinea, Nepal; Malaysia; Cambodia; and Indonesia, where it accounted for 2.5 percent (or more) of GDP in 2006. As in Africa and Latin America and the Caribbean, subsistence production in the forestry sector is significant in this region.

China, Thailand and Viet Nam are the only large countries where the forestry sector was growing faster than whole economy over the period from 2000 (mainly due to the recent expansion of forest processing industries in these countries). The share of these three countries in the value added of forestry sector in Developing Asia-Pacific region increased from about 30 percent in 1990 to about 55 percent in 2006. Moreover, forestry sector value-added in China has doubled after 2000, and this country by the size of the forestry sector now ranks second in the World behind the United States of America (in terms of value-added in the forestry sector). Just few years ago (in 2002), the size of China's forestry sector was behind the United States of America, Japan, Canada, Brazil and Germany. The contribution of the forestry sector to GDP sustained at around 1.3 percent in Developing Asia-Pacific region just because of the rapid expansion in China over the period from 2000.

In Easter Europe (including the Russian Federation), forestry sector played a crucial role in recovery of economies during the transition period (1990s). After the steep recession in these economies in the early-1990s, the forestry sector has become one of the leading sectors and it has recovered faster than many other sectors in most of these countries. For example, the contribution of the forestry sector to GDP fell from 1.5 percent in 1990 to 1.1 percent in 1992, but has since increased to 1.5 percent in 2000. In later years the growth of other sectors of economy took over the forestry sector and the contribution of the forestry sector in Eastern Europe gradually decreased to 1.2 percent in 2006.

Some of the reasons for the growth in forestry sector value-added in these countries include: abundant forest resources; cheap labour; high rates of foreign direct investment; and large-scale privatisation programmes in many of these countries. These conditions have created a good economic environment for the rapid development of forestry and forest industries.

At the level of individual countries, the forestry sector now accounts for more than 1.5 percent of GDP in 10 of the 20 countries in this region. Furthermore, the forestry sector is particularly important in Estonia and Latvia, where it accounts for almost four percent of GDP.

In four regions – Northern America, Western Europe, Developed Asia-Pacific region and North Africa, Western and Central Asia - the economic importance of the forestry sector is generally lower than in other parts of the World. However, there is considerable variation between countries in these regions.

In Northern America, the forestry sector accounts for about 1.0 percent of GDP, down from 1.4 percent in 1990. This regional total figure is highly influenced by the downward trend in United States of America where the forestry sector's contribution to GDP has gradually decreased, from 1.3 percent in 1990 to 0.8 percent in 2006. In Canada, the forestry sector accounts for about three percent of GDP and the contribution remained relatively stable.

In Western Europe, the contribution of the forestry sector to GDP declined from 1.4 percent to 0.9 percent over the period 1990 to 2006. However, in Finland, the forestry sector's

contribution to GDP is the highest of all developed countries (at six percent in 2006). It is also significant in Sweden (four percent of GDP) and Austria and Portugal (two percent of GDP in both countries). In other West European countries, the forestry sector accounts for around one percent (or less) of GDP.

In the Developed Asia-Pacific region, the forestry-sector's contribution to GDP has declined from 1.2 percent in 1990 to 0.7 percent in 2006. The downward trend in the economic importance of the sector largely reflects developments in Japan and, to a lesser extent, Australia. In contrast, the forestry sector remains important in New Zealand, where it accounts for about two percent of GDP.

The economic importance of the forestry sector in North Africa, Western and Central Asia has also declined and the contribution of the sector to GDP in this region is the lowest in the World (0.3 percent). In most of the countries in this region, the forestry sector makes a negligible contribution to GDP, although the sector accounts for about one percent of GDP in Tunisia, Lebanon, Morocco, Cyprus and Turkey.

Potential underestimation

The problems of underestimation of the value-added in the forestry sector are very similar to the problems discussed above with respect to forestry sector employment statistics. In reports and official statements at FAO meetings, national forest administrations frequently state that their national income accounts do not capture all of the benefits of forestry and that the real economic contribution of the forestry sector is far above the levels given in published national income statistics.

As with the employment statistics, the most common sources of underestimation are likely to be the value-added from woodfuel production activities and the gathering and processing of non-wood forest products. These activities are not likely to be fully captured and included in published national income accounts in many countries.

In recent years, a number of developing countries attempted to quantify the value of informal or non-monetary activities in their national income accounts. Several countries (e.g. Ethiopia, Niger, and Mozambique) have recently revised whole series for forestry value-added and published them in official statistics (UN, 2008c). A brief review of some of these statistics showed that the results so far have been mixed (for more discussion on this see FAO, 2004a).

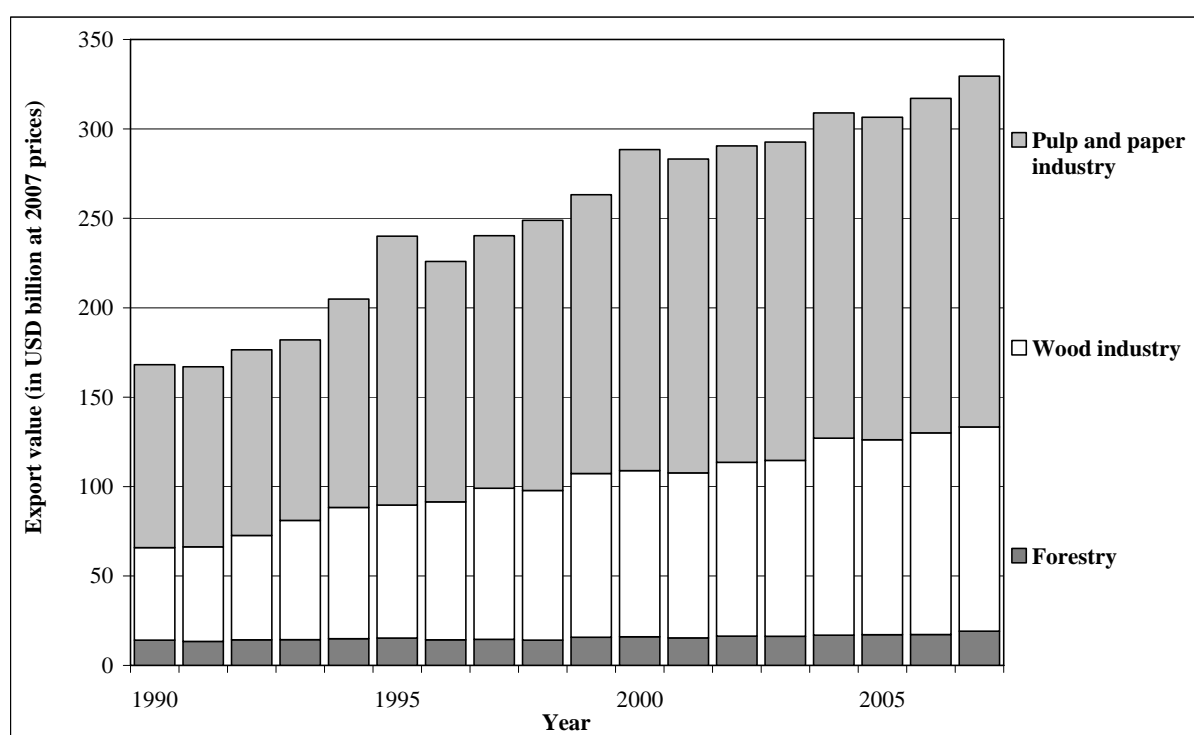

Due to the variability in the estimates of value-added in informal activities (and the lack of estimates in most cases), estimates of the value-added in informal forestry sector activities (where available) were deliberately excluded from the figures presented above. This was done in order to improve comparability between countries and over time. The little evidence that does exist confirms that the value-added in informal activities is probably substantial in many developing countries and that including these figures would significantly increase the recorded contribution of the forestry sector to GDP. However, a more detailed and in-depth study would be required to elaborate on this issue and produce credible estimates of the value-added from these activities.

Forest products trade

The importance of international trade in forest products has been measured as the proportion of forest products in total merchandise trade (by value).²⁰ In terms of exports, this measure indicates the contribution of the domestic forestry sector to trade balances. In terms of imports, the share of forest products in imports is less of an indicator of the importance of the domestic forestry sector, but it does indicate where the sector could play an important role in terms of import substitution.

There are a number of benefits of international trade. At a basic economic level, it allows producers and consumers to buy and sell products at the best available price. From a development perspective, it can also be a driving force for economic development, particularly where the domestic market is small or prices are low due to low incomes. Increased exports or import substitution can also increase or protect foreign currency reserves, which is a concern in some developing countries. In view of these benefits, the level of international trade in forest products is another indicator of the contribution of the sector to national economies.

Figure 21 Exports of forest products by sub-sector, 1990-2007

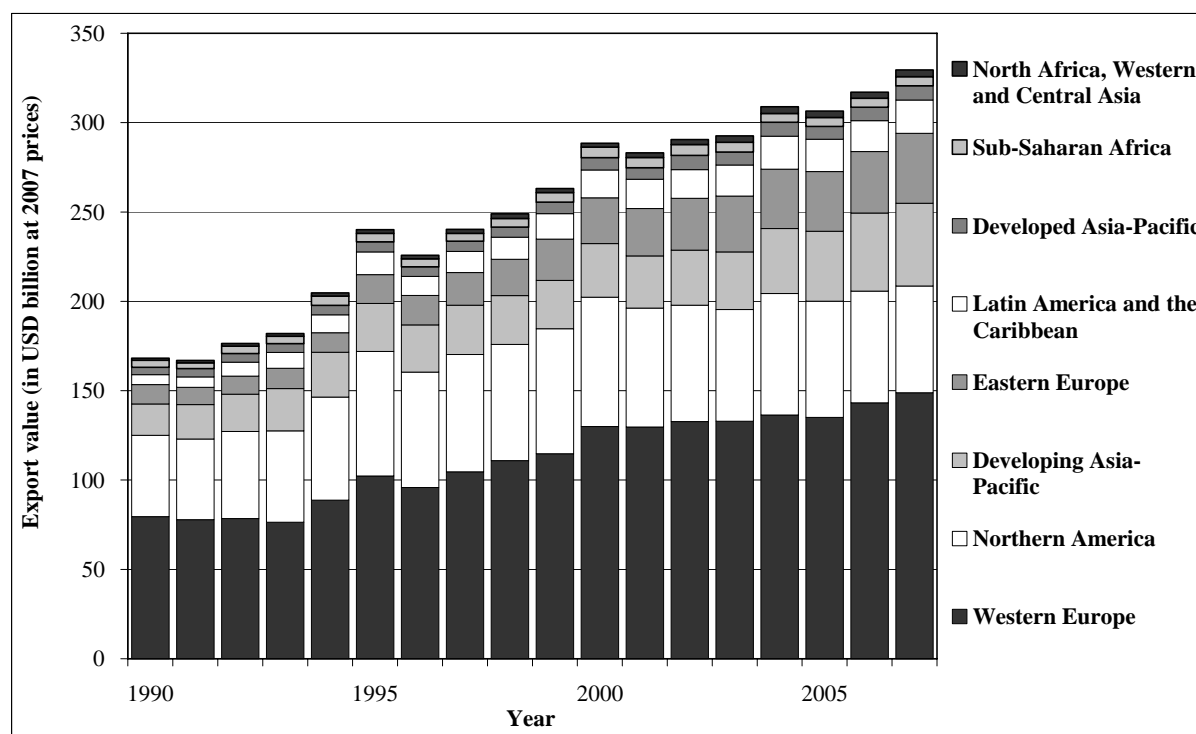

Note: products from the forestry sub-sector (ISIC Division 02) comprise roundwood and non-wood forest products; products from the wood industry comprise sawnwood, wood-based panels, wood chips and residues, charcoal and further processed wood products excluding furniture; products from the pulp and paper industry comprise pulp, paper, recovered paper and further processed paper products excluding printed articles.

Globalisation during the 1990s has led to an explosion in international trade in goods and services and the forestry sector has followed this broader global trend. For example, the real value of forest products exports nearly doubled over the last 17 years to reach a level of

²⁰ These figures have all been adjusted to USD at the price levels and exchange rates prevailing in the year 2007.

USD 330 billion in 2007 (see Figure 21). In addition to this, wooden furniture exports more than tripled over the same period and reached USD 54 billion at the global level in 2007. Furthermore, international trade in forest products has generally expanded at similar rates in both developed and developing countries (see Figure 22).

Figure 22 *Exports of forest products by region, 1990-2007*

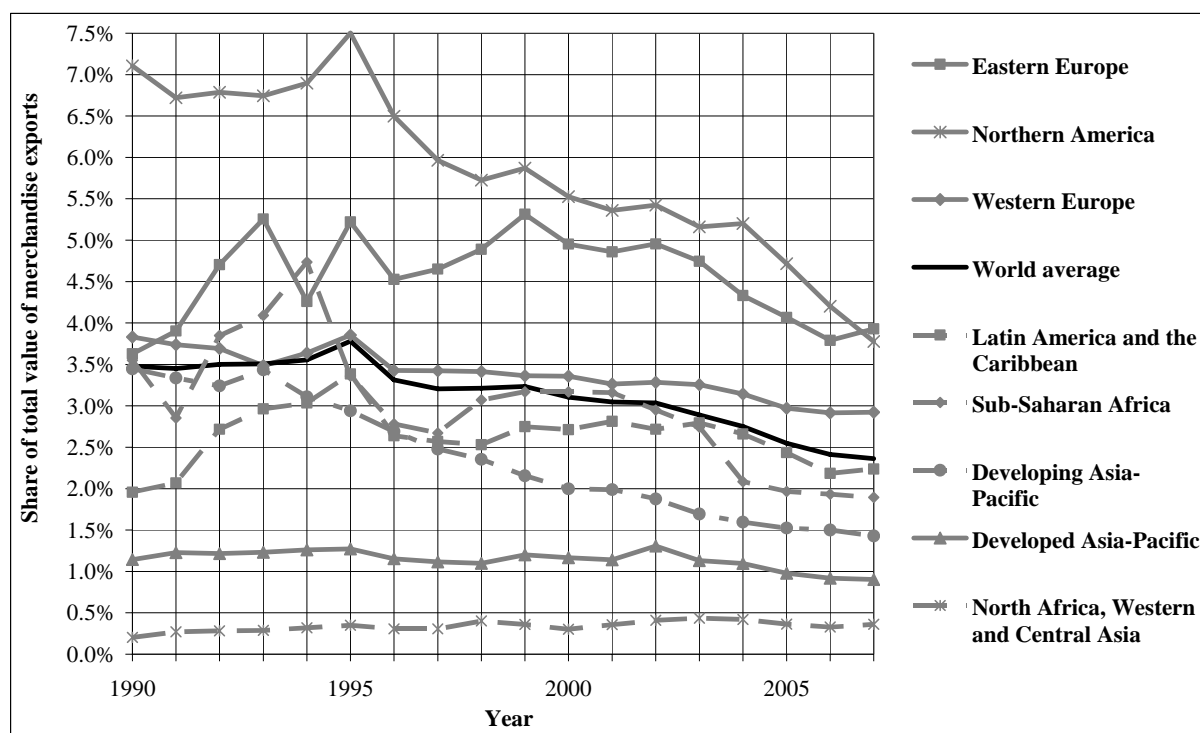

Trends in the share of forest products in total merchandise exports

At the regional level, exports of forest products are dominated by the three developed regions. For example, in 2007, Western Europe and Northern America together accounted for about 65 percent of global forest products exports, followed by the Developing Asia-Pacific region (with a 15 percent share) and Eastern Europe (with 10 percent share). Furthermore, most international trade in forest products is either trade between countries within each of these regions or between these four regions.

As already noted, the value of international trade in forest products increased nearly doubled over the period 1990 to 2007. However, in spite of this rapid growth in international trade, the growth in forest products trade has been less than the growth of other merchandise trade. Therefore, the share of forest products in total merchandise exports declined from 3.5 percent in 1990 to 2.4 percent in 2006 (see Figure 23).

This downward trend also appears in all regions except Latin America and the Caribbean. In Eastern Europe, the recovery in the forestry sector has generally been more rapid than in many other parts of the economy during 1990s, however in later years growth in forest product exports was behind other sectors of economy (same trend as in value-added). At the country level, the share of forest products in total merchandise exports has also declined in all of the major trading nations with the exception of a few countries where exports of forest products are particularly significant (e.g. Brazil and New Zealand).

Figure 23 *Share of forest products in total merchandise exports by region, 1990-2007*

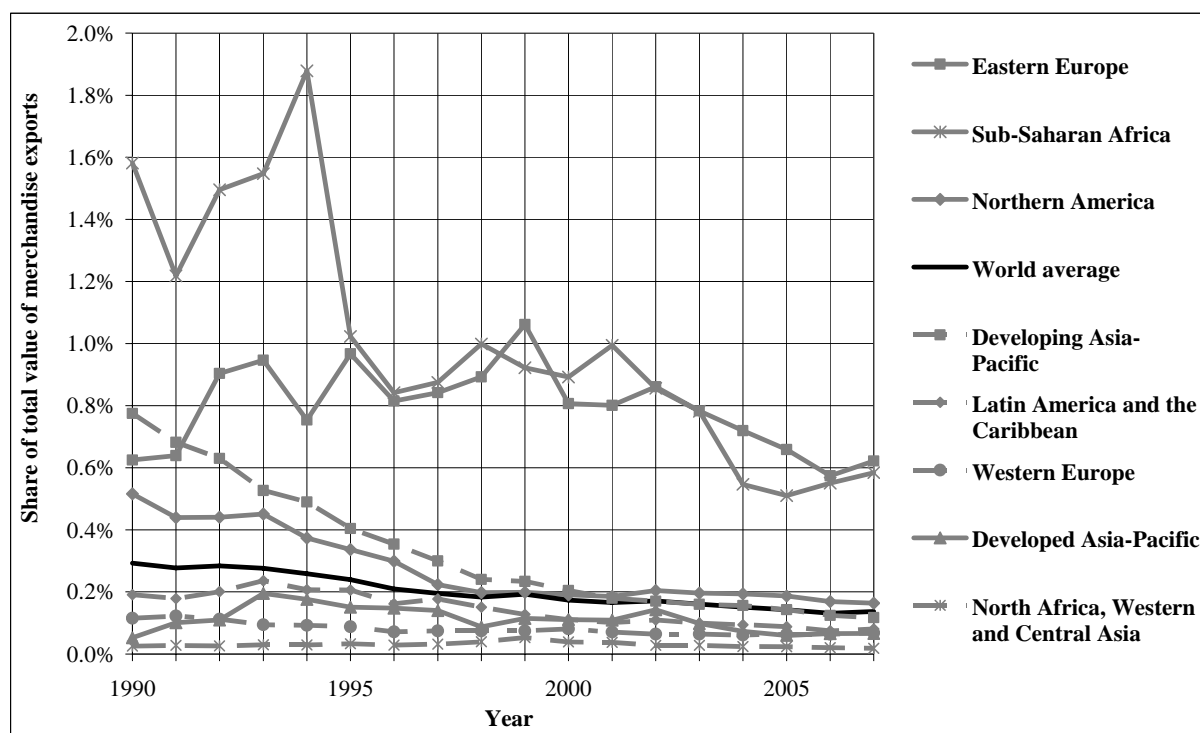

Another interesting feature of the trends in forest products exports is that the value of exports fluctuates quite a lot from year to year (by up to 20 percent). This is largely due to the volatility in international prices for pulp and paper products (which account for about 60 percent to 65 percent of the total value of global forest products trade). The value of exports from the other two forestry sub-sectors was generally more stable, but still changed by as much as ten percent (in real terms) from year to year.

Figure 24 shows the trends in the share of products from the forestry sub-sector (i.e. roundwood and non-wood forest products) in total merchandise exports. In general, exports of roundwood and non-wood forest products account for a very small share of forest products exports (about six percent of total forest products exports) and exports from this sub-sector now account for less than 0.2 percent of total merchandise exports at the global level.

At the regional level, exports from this sub-sector remain quite significant in Sub-Saharan Africa and Eastern Europe. In most other regions, the value of exports has not increased (or increased very slightly) in real terms, resulting in a steep decline in the contribution of this sub-sector to total merchandise exports. These trends reflect the general reluctance of most countries to export roundwood, in the belief that domestic processing can generate income and employment in the national economy.

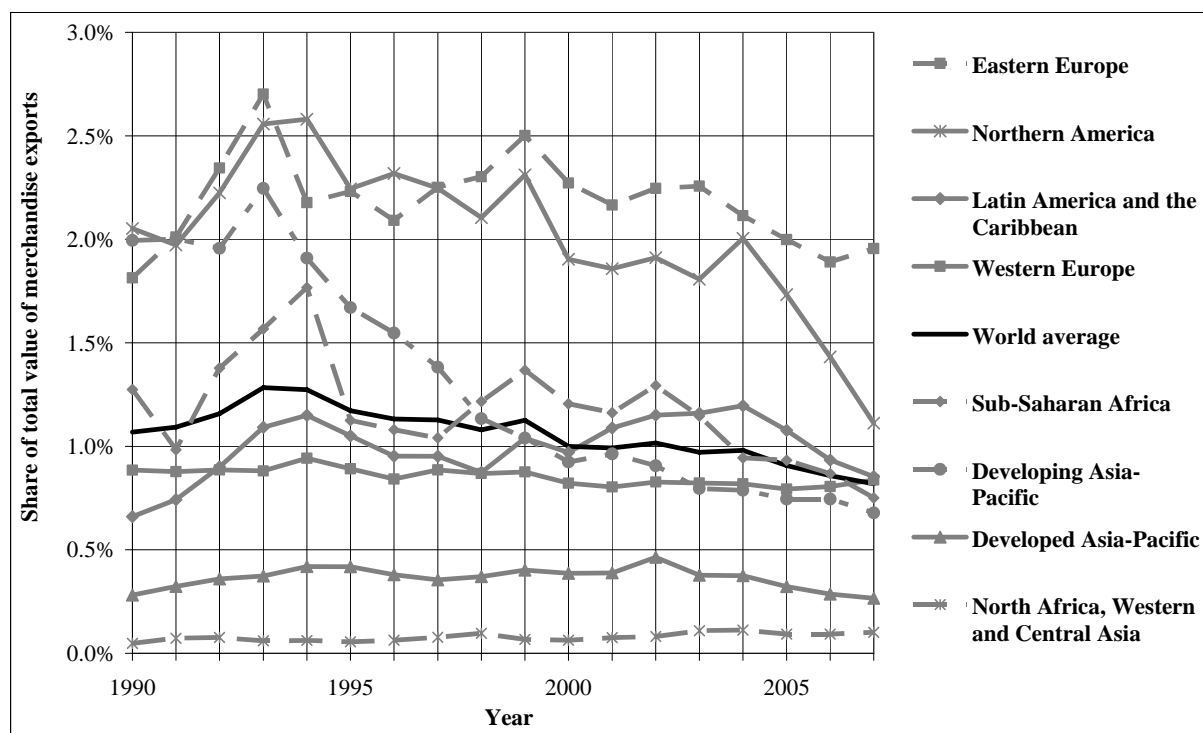

Exports of products from the wood industry (i.e. charcoal, sawnwood, wood based panels, wood chips and residues, and further processed wood products) account for nearly 35 percent of total forest products exports. Their contribution to global merchandise exports has declined slightly from just below 1.1 percent in 1990 to just over 0.8 percent in 2007 (see Figure 25).

Figure 24 *Share of products from the forestry sub-sector in total merchandise exports by region, 1990-2007*

Note: products from the forestry sub-sector (ISIC Division 02) comprise roundwood and non-wood forest products.

Figure 25 *Share of wood industry products in total merchandise exports by region, 1990-2007*

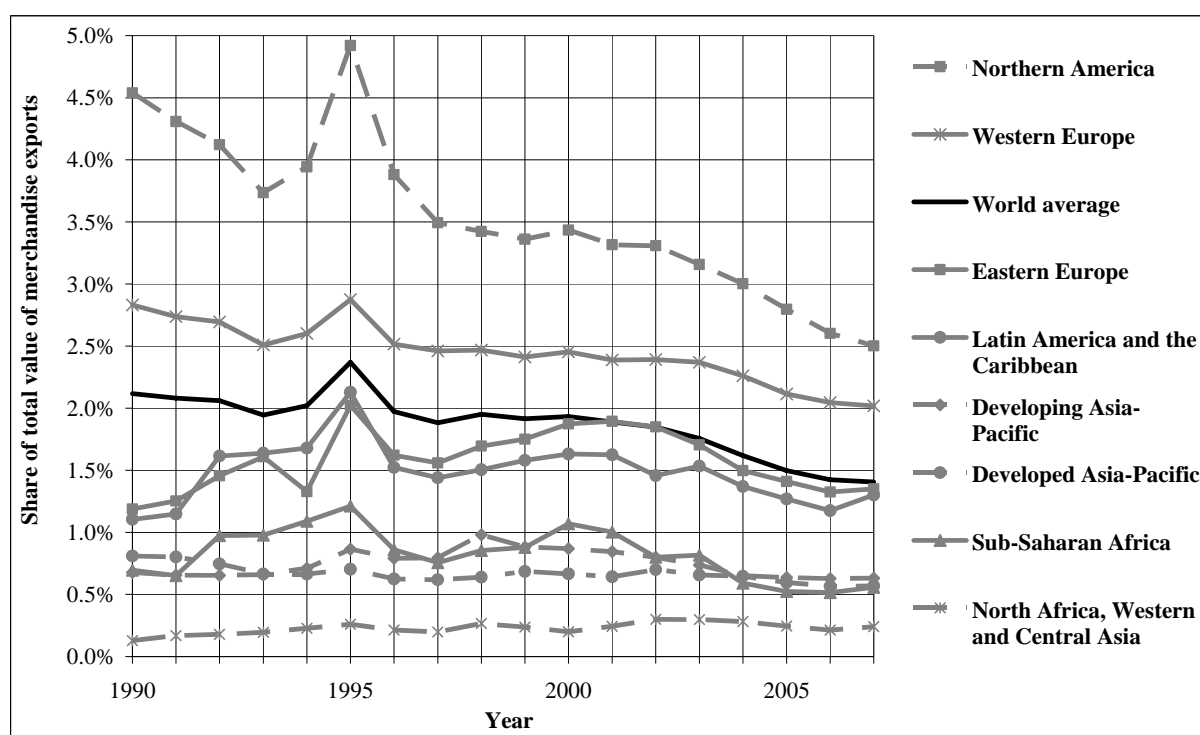

Note: products from the wood industry comprise sawnwood, wood-based panels, wood chips and residues, charcoal and further processed wood products excluding furniture.

At the regional level, this sub-sector's contribution to exports has declined or remained about the same in almost all regions. An exception is Northern America where exports went down steeply in the recent years due to housing market crash in the United States of America (Canada's exports nearly halved over the period 2004 to 2007 in real terms).

Exports of wood industry products remain relatively more important in Northern America and Eastern Europe due to high level of intra-trade between Canada and the United States of America and between Eastern Europe and Western Europe, respectively. In these two regions wood industry products currently account for 2.0 percent to 2.5 percent of total merchandise exports. In other regions, the importance of this sub-sector to exports is similar to or below the global average.

Figure 26 *Share of pulp and paper industry products in total merchandise exports by region, 1990-2007*

Note: products from the pulp and paper industry comprise pulp, paper, recovered paper and further processed paper products excluding printed articles.

Exports of products from the pulp and paper industry account for the largest share of total forest product exports and currently account for about 1.4 percent of total merchandise exports at the global level (compared with about 2.1 percent in 1990). Exports from the pulp and paper industry are relatively important in Northern America and Western Europe, but have declined in importance since 1990 (particularly in Northern America). In the other regions, the importance of exports from this sub-sector has remained about the same. They account for just below 1.5 percent of total merchandise exports from Latin America and the Caribbean and Eastern Europe. With the exception of North Africa, Western and Central Asia (where they are insignificant), pulp and paper products account for about 0.5 percent of total merchandise exports from the other regions.

Trends in the share of forest products in total merchandise imports

At the global level, the trends in the share of forest products in total merchandise imports are roughly the same as those presented earlier for exports. However, comparing between the regions, Western Europe is the main consumer of imported forest products (40 percent of global forest products imports), followed by the two Asia-Pacific regions (20 percent) and Northern America (15 percent). In addition, since the mid-1990s, the value of imports into the Developing Asia-Pacific region overtook the value of imports into the Developed Asia-Pacific region, due to the decline in imports into Japan and the rapid growth of forest product imports into China.

Figure 27 *Share of forest products in total merchandise imports by region, 1990-2007*

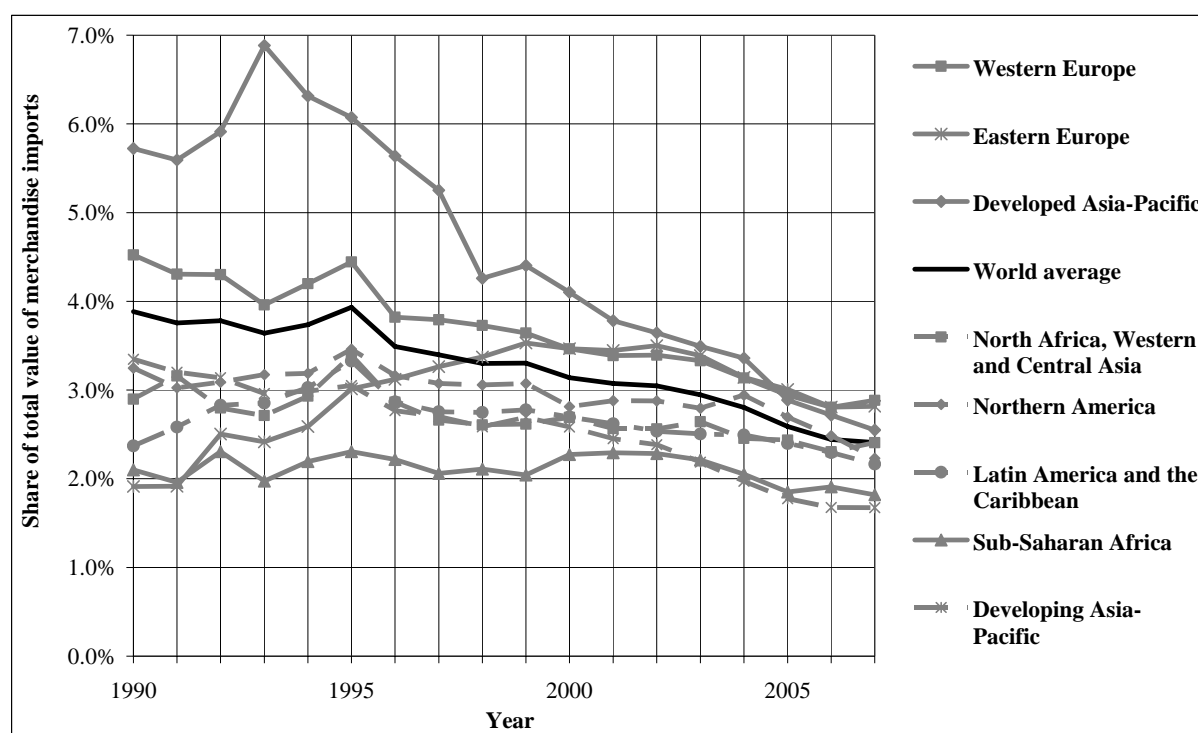

Figure 27 shows the trends in the share of forest products in total merchandise imports by region during the 1990s. Globally, the share fell from about 3.9 percent in 1990 to 2.4 percent in 2007. At the regional level, imports of forest products into the Developed Asia-Pacific region are relatively more important than elsewhere, although this importance has fallen dramatically in the past decade from six percent to three percent (due to a sharp fall in the value of imports into Japan). In most other regions, the share of forest products imports in total merchandise imports is close to the global average or slightly below it. In most of these regions, this share has also declined or remained about the same since 1990.

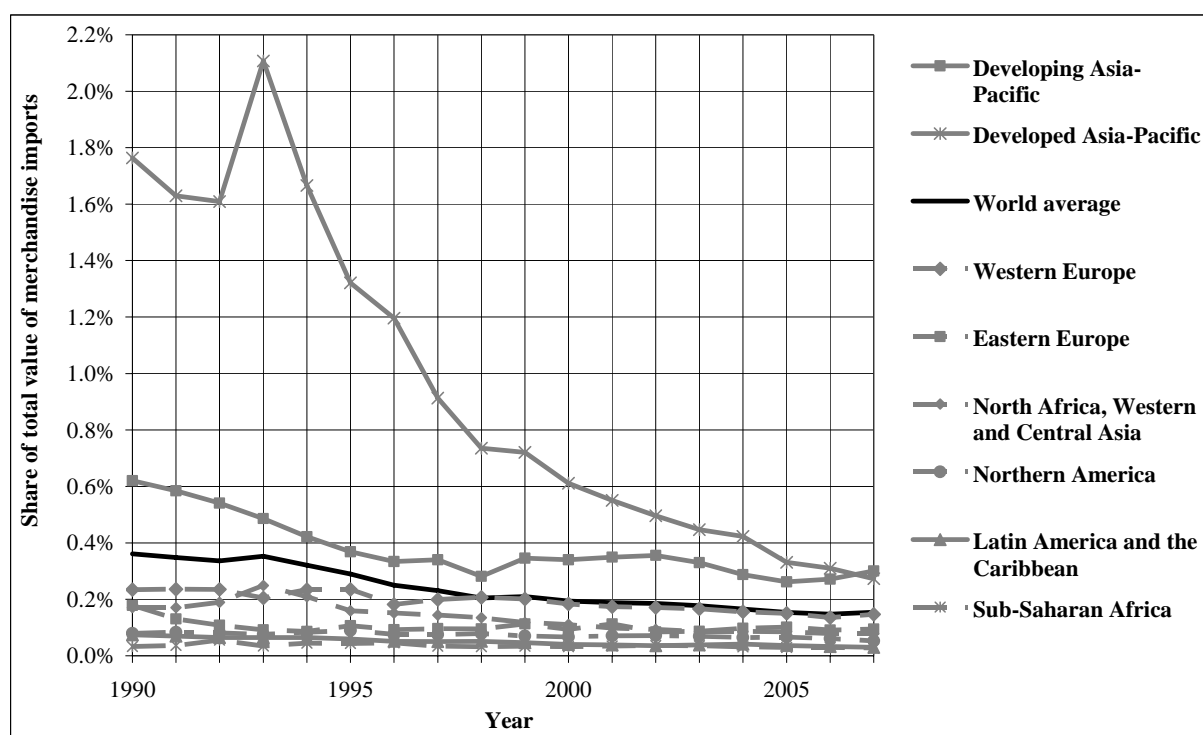

Comparing the value of imports with the value of exports, there were several changes in net trade at the regional level over the period 1990 to 2007. North Africa, Western and Central Asia and both Asia-Pacific regions remained the leading net importers. Western Europe and Latin America and the Caribbean became net exporters after 2000. Eastern Europe sustained trade surplus in forest products while in Sub-Saharan Africa²¹ net exports have shrunk

²¹ In Sub-Saharan Africa, value of forest products exports remained stagnant over the period 1990 to 2007 while the imports (mainly paper products) more than doubled over the same period.

considerably. In Northern America, the value of forest products imports has been growing much faster than exports and by 2007 exports exceeded imports by 10 percent only (as compared to 80 percent and 40 percent in 1990 and 2000, respectively).

At the country level, changes in net trade are even more noticeable. For example, net imports have grown considerably in the United States of America, India, Mexico and many countries in Western Europe and North Africa, Western and Central Asia. A trend of rapid growth in net exports is visible in Germany, Nordic countries, Austria, Brazil, Chile, New Zealand and Poland. China, after a strong growth in imports during the 1990s, managed to reduce negative trade balance in forest products by half through increased exports in recent years.

Figure 28 *Share of products from the forestry sub-sector in total merchandise imports by region, 1990-2007*

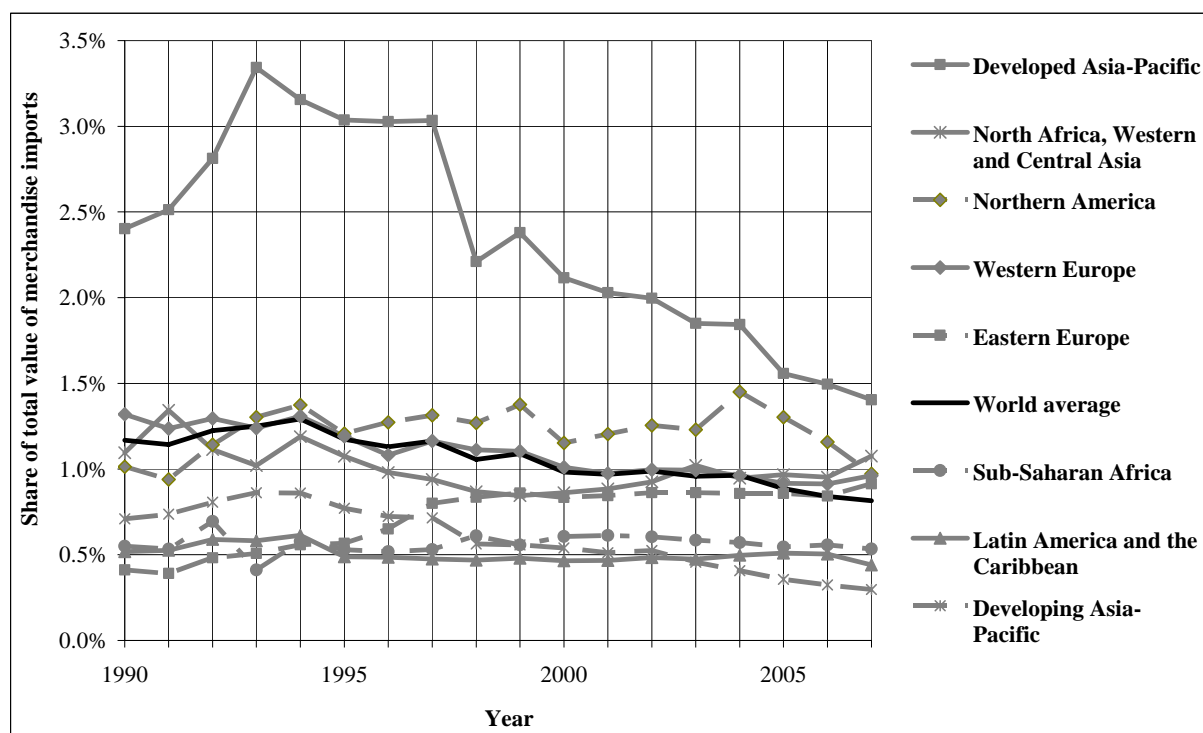

Note: products from the forestry sub-sector (ISIC Division 02) comprise roundwood and non-wood forest products.

At the level of individual sub-sectors, the share of products from the forestry sub-sector in total merchandise imports has declined over the period (see Figure 28). It is significant in the two Asia-Pacific regions, but not elsewhere. In the two Asia-Pacific regions, the most significant developments have been the dramatic fall in the importance of imports into Japan and the Republic of Korea over the whole of the period 1990 to 2007 compared with the growing importance of imports into China from the mid-1990s.

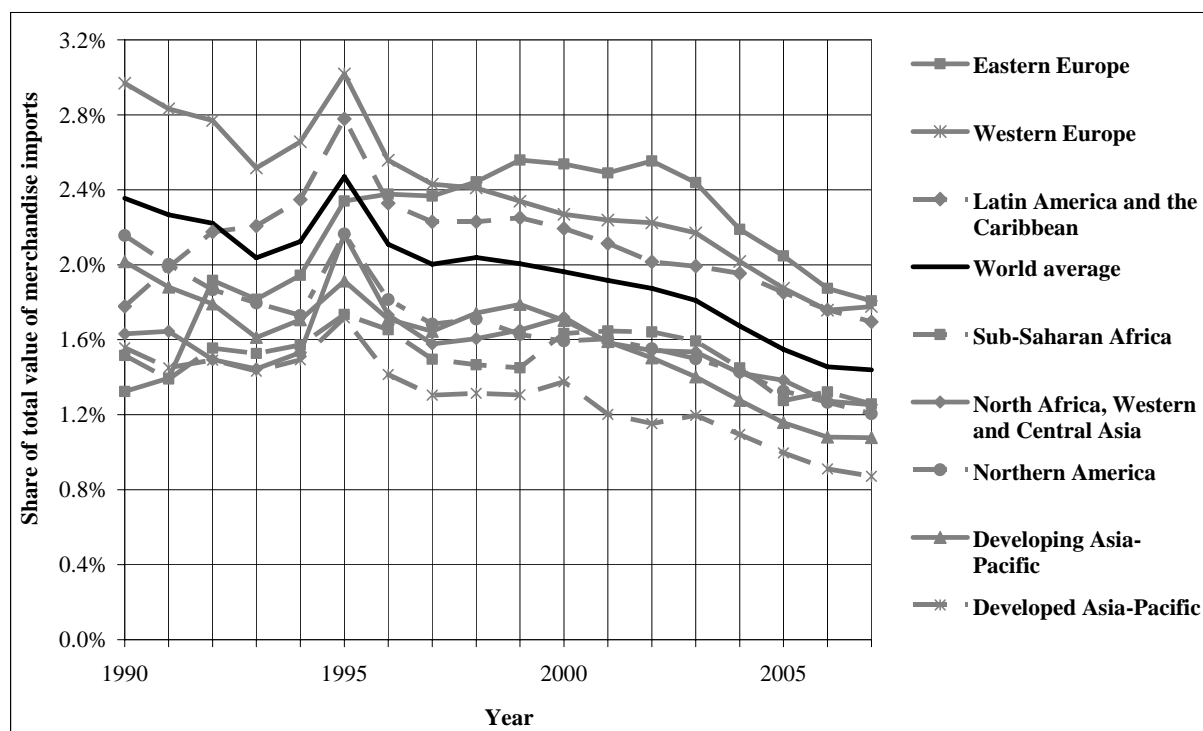

Figure 29 shows the recent trends in the share of wood industry products in total merchandise imports, which has declined from about 1.2 percent in 1990 to 0.8 percent in 2007. At the regional level, the importance of wood industry products is far higher in the Developed Asia-Pacific region than elsewhere. This is due to the high level of imports into Japan, which has remained stable. There is a flat or downward trend in the importance of imports of wood industry products in every region except Eastern Europe.

Figure 29 *Share of wood industry products in total merchandise imports by region, 1990-2007*

Note: products from the wood industry comprise sawnwood, wood-based panels, wood chips and residues, charcoal and further processed wood products excluding furniture.

Figure 30 *Share of pulp and paper industry products in total merchandise imports by region, 1990-2007*

Note: products from the pulp and paper industry comprise pulp, paper, recovered paper and further processed paper products excluding printed articles.

Figure 30 presents the same information, but for the pulp and paper industry. This shows a decline in the importance of imports in every region. The share of pulp and paper industry products in total merchandise imports decline from 2.4 percent to 1.4 percent over the period from 1990 to 2007. Globalisation in the pulp and paper industry led to an increased competition and falling real prices which negatively affected this sub-sector in terms of profitability, value-added and export earnings.

Potential underestimation

In general, the availability and quality of trade data is much better than for employment and value-added. There is only one main issue concerning the analysis of the forestry sector's contribution to total merchandise trade at the global level.

FAOSTAT (FAO, 2008a) and COMTRADE (UN, 2008d) databases do not contain data for the new European countries before they were created in the early-1990s. Trade between these locations in the former-USSR, Czechoslovakia and Yugoslavia was probably significant in many cases. For example, prior to independence, most of the former-USSR countries were highly dependent on the Russian Federation to supply forest products (see more discussion in FAO, 2004a). In addition to this, the quality of the statistics that are available for some of these countries is quite limited in the databases, particularly in the first half of the past decade. Based on an assessment of some of these issues, it is quite obvious that the trends in forest products trade in these new countries would show a much steeper fall in the early-1990s if the value of trade between these locations (before independence) was known.

SUMMARY AND CONCLUSIONS

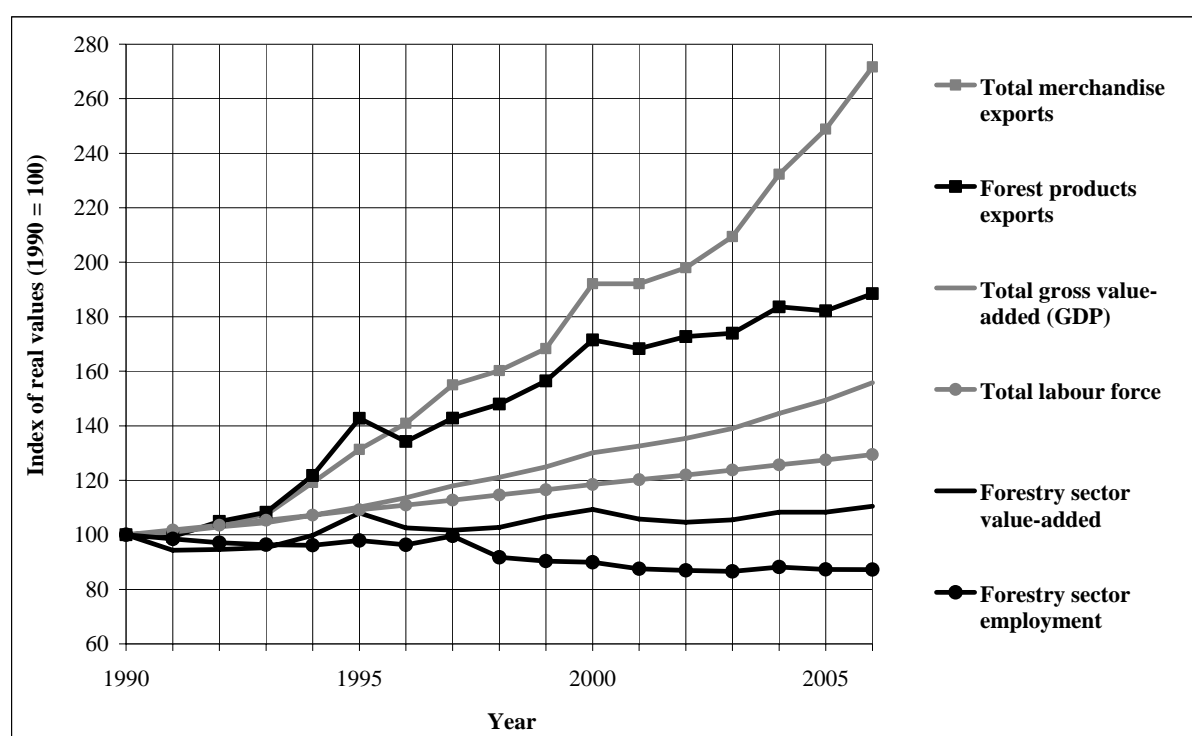

Table 6 presents a summary of all of the information given earlier about the size and trends of the global forestry sector. At the global level in 2006, the (formal) forestry sector employed 13.7 million people, generated USD 468 billion in value-added and exported products with a total value of USD 291 billion. At the global level over the period, employment decreased by about 13 percent, value-added increased by 10 percent (in real terms) and the real value of forest products exports increased by almost 100 percent. Overall, forestry sector was behind the growth in employment, value-added and trade in other sectors (see Figure 31).

Table 6 *Summary of the trends and current status of the total forestry sector employment, value-added and exports by region*

Region	Regional distribution of global forestry sector employment, value-added and exports in 2006						Annual change rate in absolute values (in percent)

Figure 31 *Employment, value-added and export trends at the global level for the total forestry sector and whole economy, 1990-2006*

At the regional level, the above table shows some interesting and important differences between regions.

First, in Sub-Saharan Africa, the table shows that there have been some improvements in the sector, with increased employment, value-added and exports from the sector over the 1990s. However, after 2000 employment and exports declined and only value-added continued to grow in this region. One country - South Africa - accounts for a large proportion of these improvements.

Generally, the forestry sector in Africa does not perform well compared with other regions. For example, Sub-Saharan Africa accounts for about 16 percent of the global forest area, but only two to three percent of global value-added and exports. Furthermore, the level of value-added and exports per employee is well below the global average. The structure of the forestry sector in Africa (i.e. the predominance of forestry activities compared to forest processing activities) suggests that Africa still suffers from a significant lack of industrialisation and general development, due to a variety of political, economic and structural problems. Addressing these problems is likely to remain a concern for policymakers in this region for many years to come.

At the other end of the scale, the three developed regions (Northern America, Western Europe and the Developed Asia-Pacific region) account for about 25 percent of global employment and the majority (about 65 percent) of global value-added and forest products exports. As would be expected, for almost all measures of productivity (e.g. production, value-added or exports per m³/tonne, per hectare of forest or per employee), the forestry sector in these three regions performs at a level that is well above the global average.

However, it is interesting to note that, in terms of the trends in these figures, only exports have grown in all three regions (and they fell after 2000 in Northern America). Employment is declining continuously, largely due to the substitution of capital for labour. The disturbing trend is that value-added is shrinking in Northern America, Japan and most countries in Western Europe. This is due to increasing competition in neighbouring regions, which may cause some structural changes and changes in trade flows in the future. Policymakers and the forest industry in these countries would be well advised to reassess their competitive strengths and advantages in view of the historical changes in these figures and the likely changes in the future.

Eastern Europe presents a very interesting situation that has arisen due to the profound social, political and economic changes that have taken place in this region during the 1990s. Forestry sector employment has fallen, but is still relatively high given the overall size of the forestry sector in this region. Exports are significant and have increased dramatically over the 15 years. The main problem in this region is that the level of value-added in the sector is comparatively low and has fallen significantly over the past decade (although it has started to rise again in recent years).

A comparison of the figures for employment, value-added and trade suggest that there is substantial potential for development of the forestry sector in this region. However, there is also a significant need for investment in new technology, improved marketing and an upgrading of human resources. Currently, the relatively high level of employment suggests that further reductions in employment might be justified. However, given the substantial forest resources in this region (about one-quarter of the global forest area) an alternative

scenario for the future could be that new investment in the sector would increase labour productivity, leading to further expansion in value-added and exports without significant job losses. The challenge for policymakers and the forest industry in this region will be to assess whether to follow the development model of the developed regions (i.e. substituting capital for labour) or to pursue expansion of the sector on all fronts.

Latin America and the Caribbean and the Developing Asia-Pacific region are the two regions where the forestry sector has expanded on all fronts. Particularly this growth was characteristic for Latin America and the Caribbean during the 1990s, while in later years more rapid growth has shifted to the Developing Asia-Pacific region (mainly China). In these two regions, forestry sector employment (except employment in China during 1990s), value-added and trade have all expanded significantly over the last 15 years. This expansion has been driven by many factors, including: an abundance of cheap skilled labour; relatively abundant forest resources; a high rate of economic growth; specific policies to encourage development and investment in the sector; and more general improvements in the investment climate.

Many of these countries have made the transition from having a forestry sector that is largely focused on the production of roundwood and simple processed products to one where a diversified range of products are produced and marketed at a global scale. The measures of productivity in these countries are constantly improving are certainly higher than the average for all developing countries. The challenge for these countries will be to maintain this momentum while, at the same time, reducing the pressure on their forest resources. Already, many countries have started to do this with significant forest plantation programmes to guarantee future wood supplies.

Lastly, the figures show that the forestry sector in North Africa, Western and Central Asia accounts for only a small fraction of global employment, value-added and exports. Negligible forest resources limit the development of the whole sector and most of demand is met through imports. It seems likely that the development of secondary processing and paper industry may partly reduce the growing dependence on imports of forest products in this region.

Table 7 *Summary of the trends and current status of the contribution of the forestry sector to employment, GDP and total merchandise exports by region*

Region	Contribution of the forestry sector (in percent)								
	Share of labour force			Share of GDP			Share of merchandise exports		
	1990	2000	2006	1990	2000	2006	1990	2000	2007
Sub-Saharan Africa	0.2	0.2	0.1	2.2	2.0	1.8	3.6	3.2	1.9
North Africa, Western and Central Asia	0.3	0.2	0.2	0.5	0.4	0.3	0.2	0.3	0.4
Developed Asia-Pacific	1.0	0.7	0.6	1.2	0.9	0.7	1.1	1.2	0.9
Developing Asia-Pacific	0.4	0.3	0.3	1.9	1.3	1.3	3.4	2.0	1.4
Western Europe	1.3	1.0	0.9	1.4	1.1	0.9	3.8	3.4	2.9
Eastern Europe	1.9	1.3	1.2	1.5	1.5	1.2	3.6	5.0	3.9
Northern America	1.1	1.0	0.8	1.4	1.2	1.0	7.1	5.5	3.8
Latin America and the Caribbean	0.8	0.8	0.7	1.9	1.7	1.6	2.0	2.7	2.2
<i>All tropical countries</i>	<i>0.3</i>	<i>0.3</i>	<i>0.2</i>	<i>2.0</i>	<i>1.7</i>	<i>1.5</i>	<i>3.4</i>	<i>2.5</i>	<i>1.9</i>
<i>All temperate countries</i>	<i>0.9</i>	<i>0.6</i>	<i>0.6</i>	<i>1.4</i>	<i>1.1</i>	<i>0.9</i>	<i>3.5</i>	<i>3.2</i>	<i>2.4</i>
World total	0.6	0.5	0.4	1.4	1.2	1.0	3.5	3.1	2.4

Table 7 presents a summary of the information about the contribution of the sector to national economies or the economic importance of the sector. This shows that, at the global level in 2006, the sector employed about 0.4 percent of the labour force, contributed about 1.0 percent

to GDP and accounted for about 2.4 percent of global merchandise trade in 2007. However, these measures have all declined in recent years, due to more rapid growth in other parts of the economy. Furthermore, this decline in the sector appears for all of the measures in nearly all regions.

Comparing between the regions, the contribution of the sector to employment is relatively more important in the three developed regions and Eastern Europe. This is partly because of the employment generated in the forest processing sector, which is generally less developed in developing countries. The importance of forestry sector employment has remained about the same in the all developing regions. This indicates that the expansion of the sector in these regions has created new jobs at a rate that has kept up with the growth in the labour force in these countries. In the developed regions and Eastern Europe, the importance of employment in the sector has declined due to a reduction in the numbers employed in the sector.

In terms of the contribution to GDP, the forestry sector remains relatively important in all developing regions and Eastern Europe. However, the importance of the sector has declined over the last 15 years. In particular, there has been a significant fall in the contribution of the forestry sector to GDP in the Developing Asia-Pacific region during the 1990s. This is due to the very high rates of growth in other parts of the economy in this region. The same trend is characteristic for all developed regions.

The last point above reflects a more general observation from this analysis. In general, value-added in the forestry sector has not increased rapidly except in a few countries where development of the sector has been a specific national development priority. Very few countries have focused on the development of the forestry sector, preferring instead to promote the development of other sectors. Thus, it is generally the case that the forestry sector has been left behind, particularly in rapidly growing economies. Furthermore, this suggests that the forestry sector is not a major driving force for economic growth and development except in specific circumstances.

Comparing between the three measures, the forestry sector makes the greatest contribution to merchandise exports. However, although exports of forest products have increased substantially, the contribution to merchandise exports has fallen. The regions where the forestry sector is a relatively important component of trade are Europe and Northern America. Forest products share in exports continuously grew only in North Africa, Western and Central Asia. Furthermore, the importance of forest products exports has increased in Eastern Europe and the Latin America and the Caribbean but forest sector's contribution to export earnings declined in these two regions in recent years. All other regions saw a steady decline in the importance of forest products exports.

These differences reflect the fact that most trade in forest products is between the three developed regions and Eastern Europe or between individual countries within each of these regions. In spite of growth in export quantities of several commodities, the importance of forest products exports from developing regions remains generally low at the global level (14 percent of value in 2007 as compared to 10 percent during the 1990s). This reflects their greater comparative advantage in exporting other types of goods. It may also reflect some concern in developed countries, in recent years, about the environmental impact of forest harvesting in developing countries. In the few cases where developing countries have been successful at increasing the importance of forest product exports, it has usually been in areas

where the environmental impacts of production are less controversial (e.g. exports of pulp and paper products from Brazil, Chile and South Africa).

The above comments are, of course, very generalised and there are many differences between countries in each of the regions analysed above. For example, the detailed tables presented in Annex 2 show how important the forestry sector is in many relatively small countries and in a small number of large countries. It is hoped that the detailed figures and references presented in Annex can be used as a starting point for more in-depth analyses of forestry sector developments at the level of individual countries. In addition to this, further work on the contribution of informal forestry sector activities would give a much better and more balanced picture of the importance of the sector at the global, regional and country level.

A final point worth noting is the importance of improving the availability and reliability of statistics in this area. Many countries do not produce statistics about employment or value-added in the forestry sector (even where it may be significant) and those that do should be more careful about the presentation of statistics (or they will lose credibility). Reliable information is essential for the development of the sector and for monitoring sustainable forest management and FAO remains ready and willing to assist countries in this important area.

ANNEX 2 GLOBAL TABLES

Country nomenclature and regional groups used in the tables

The country names used in these tables follow standard UN practice regarding nomenclature and alphabetical listing of countries. The regional groups represent FAO's standardized regional breakdown of the world according to geographical criteria.

For statistical purposes, the data for China do not include those for the Hong Kong Special Administrative Region (Hong Kong SAR), Macao Special Administrative Region (Macao SAR) and Taiwan province of China.

The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Food and Agriculture Organization of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Totals

Numbers may not tally because of rounding and non-availability of detailed data by the countries of former Czechoslovakia, Yugoslavia, USSR, etc.

Abbreviations

0 = either a true zero or an insignificant value (less than half a unit)

– = not available

Figures presented in *italics* are FAO estimates

Notes – types of estimates:

E1 (In countries with some data, missing data has been estimated from roundwood production data, by taking employment per cubic metre of roundwood production in the years where data is available and using the production data in the missing years to estimate the likely level of employment.) Countries and territories with such estimates (see numbers in italics):

Albania, Algeria, Argentina, Armenia, Austria, Azerbaijan, Bangladesh, Barbados, Belarus, Belgium, Bhutan, Bolivia, Bosnia and Herzegovina, Brazil, Brunei Darussalam, Bulgaria, Burkina Faso, Cambodia, Cameroon, Cape Verde, Central African Republic, Chad, Chile, Colombia, Congo, Costa Rica, Côte d'Ivoire, Croatia, Cuba, Cyprus, Czech Republic, Democratic Republic of the Congo, Denmark, Dominican Republic, Fiji, Finland, France, French Guiana, French Polynesia, Gabon, Georgia, Germany, Ghana, Greece, Grenada, Guam, Guatemala, Guinea-Bissau, Honduras, Hungary, Iceland, India, Indonesia, Iran (Islamic Republic of), Ireland, Israel, Italy, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Kyrgyzstan, Lesotho, Liberia, Liechtenstein, Malawi, Malaysia, Martinique, Mauritius, Mexico, Montenegro, Morocco, Mozambique, Myanmar, Namibia, Nepal, Netherlands, New Caledonia, New Zealand, Nicaragua, Niger, Nigeria, Norway, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Poland, Portugal, Republic of Korea, Republic of Moldova, Réunion, Romania, Russian Federation, Saint Pierre and Miquelon, Samoa, Saudi Arabia, Senegal, Serbia, Singapore, Slovakia, Solomon Islands, South Africa, Spain, Sri Lanka, Suriname, Swaziland, Sweden, Switzerland, Syrian Arab Republic, Tajikistan, Thailand, The former Yugoslav Republic of Macedonia, Togo, Trinidad and Tobago, Tunisia, Turkey, Turkmenistan, Uganda, Ukraine, United Kingdom of Great Britain and Northern Ireland, United Republic of Tanzania, United States of America, Uruguay, Uzbekistan, Vanuatu, Venezuela, Viet Nam, Zambia, Zimbabwe.

E2 (In countries with no data, employment has been estimated in the same way as E1, but using the average employment per cubic metre roundwood from neighbouring countries). Countries and territories with such estimates (see numbers in italics):

Angola, Bahamas, Belize, Benin, Botswana, Burundi, Democratic People's Republic of Korea, Ecuador, Egypt, El Salvador, Equatorial Guinea, Eritrea, Ethiopia, Gambia, Guinea, Guyana, Haiti, Lao People's Democratic Republic, Libyan Arab Jamahiriya, Luxembourg, Madagascar, Mali, Mauritania, Mongolia, Pakistan, Rwanda, Sierra Leone, Somalia, Sudan, Tonga.

Notes – types of estimates:

E1 (In countries with some data, missing data has been estimated from sawnwood and wood-based panel production data, by taking employment per cubic metre of sawnwood and wood-based panel production in the years where data is available and using the production data in the missing years to estimate the likely level of employment.). Countries and territories with such estimates (see numbers in italics):

Albania, Algeria, Andorra, Angola, Argentina, Armenia, Aruba, Bahamas, Bahrain, Bangladesh, Barbados, Belize, Bermuda, Bhutan, Bolivia, Bosnia and Herzegovina, Brazil, Brunei Darussalam, Burkina Faso, Burundi, Cambodia, Cameroon, Cape Verde, Central African Republic, Chile, Colombia, Congo, Costa Rica, Côte d'Ivoire, Cuba, Czech Republic, Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, Fiji, French Guiana, French Polynesia, Gabon, Gambia, Georgia, Ghana, Greece, Grenada, Guatemala, Haiti, Honduras, Hong Kong SAR of China, Hungary, India, Indonesia, Iran (Islamic Republic of), Iraq, Jamaica, Jordan, Kazakhstan, Kenya, Kuwait, Lao People's Democratic Republic, Lebanon, Lesotho, Liechtenstein, Lithuania, Macao SAR of China, Madagascar, Malawi, Malaysia, Malta, Mauritania, Mexico, Monaco, Montenegro, Morocco, Mozambique, Myanmar, Namibia, Nepal, New Caledonia, Nicaragua, Nigeria, Occupied Palestinian Territory, Oman, Pakistan, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Puerto Rico, Qatar, Republic of Korea, Réunion, Russian Federation, Rwanda, San Marino, Saudi Arabia, Senegal, Serbia, Sierra Leone, Singapore, Slovakia, South Africa, Sri Lanka, Sudan, Suriname, Swaziland, Syrian Arab Republic, Tajikistan, Thailand, Tonga, Trinidad and Tobago, Tunisia, Turkey, Turkmenistan, Uganda, Ukraine, United Arab Emirates, United Republic of Tanzania, United States Virgin Islands, Uruguay, Vanuatu, Venezuela, Viet Nam, Yemen, Zambia, Zimbabwe.

E2 (In countries with no data, employment has been estimated in the same way as E1, but using the average employment per cubic metre sawnwood and wood-based panel from neighbouring countries). Countries and territories with such estimates (see numbers in italics):

Benin, Chad, Democratic People's Republic of Korea, Democratic Republic of the Congo, Equatorial Guinea, Eritrea, Guinea, Guinea-Bissau, Guyana, Liberia, Libyan Arab Jamahiriya, Mali, Niger, Samoa, Solomon Islands, Somalia, Togo, Uzbekistan.

Notes – types of estimates:

E1 (In countries with some data, missing data has been estimated from pulp and paper & paperboard production data, by taking employment per ton of pulp and paper & paperboard production in the years where data is available and using the production data in the missing years to estimate the likely level of employment.). Countries and territories with such estimates (see numbers in italics):

Albania, Algeria, Angola, Argentina, Armenia, Bahamas, Bahrain, Bangladesh, Barbados, Belgium, Belize, Bolivia, Brazil, Burkina Faso, Burundi, Cambodia, Cameroon, Central African Republic, Chile, Colombia, Congo, Côte d'Ivoire, Cuba, Czech Republic, Dominican Republic, Ecuador, Egypt, Eritrea, Ethiopia, Fiji, France, French Polynesia, Gabon, Georgia, Germany, Ghana, Grenada, Guatemala, Haiti, Honduras, Hungary, Iceland, India, Indonesia, Iran (Islamic Republic of), Iraq, Italy, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Kuwait, Lao People's Democratic Republic, Lebanon, Libyan Arab Jamahiriya, Liechtenstein, Lithuania, Luxembourg, Macao SAR of China, Madagascar, Malawi, Malaysia, Mauritania, Mongolia, Montenegro, Morocco, Mozambique, Myanmar, Namibia, Nepal, Netherlands Antilles, New Caledonia, Nigeria, Occupied Palestinian Territory, Oman, Pakistan, Panama, Paraguay, Peru, Philippines, Puerto Rico, Qatar, Republic of Korea, Réunion, Russian Federation, Saint Vincent and the Grenadines, Saudi Arabia, Senegal, Serbia, Sierra Leone, Singapore, Slovakia, South Africa, Sri Lanka, Sudan, Suriname, Swaziland, Syrian Arab Republic, Tajikistan, Thailand, Tonga, Trinidad and Tobago, Tunisia, Uganda, United Republic of Tanzania, United States Virgin Islands, Uruguay, Venezuela, Viet Nam, Yemen, Zambia, Zimbabwe.

E2 (In countries with no data, employment has been estimated in the same way as E1, but using the average employment per tonne of pulp and paper & paperboard from neighbouring countries). Countries and territories with such estimates (see numbers in italics):

Bosnia and Herzegovina, Democratic People's Republic of Korea, United Arab Emirates, Uzbekistan.

Notes – types of estimates:

V1 (In countries with gross output data and some value-added data, missing data has been estimated from gross output data in missing years (if available), based on the ratio of value-added to gross output in the years where data are available.) Countries and territories with such estimates (see numbers in italics):

China, Croatia, Japan, Kyrgyzstan, Ukraine, United States of America.

V2 (In countries with some value-added data, but no gross output data for the missing years, average value-added per cubic metre of roundwood production has been used to estimate the missing figures). Countries and territories with such estimates (see numbers in italics):

Argentina, Armenia, Australia, Austria, Azerbaijan, Bahamas, Bangladesh, Belgium, Benin, Bolivia, Bosnia and Herzegovina, Botswana, Brazil, British Virgin Islands, Brunei Darussalam, Bulgaria, Burkina Faso, Burundi, Cambodia, Cameroon, Central African Republic, Chile, Colombia, Comoros, Congo, Costa Rica, Côte d'Ivoire, Cyprus, Czech Republic, Djibouti, Dominica, Dominican Republic, Equatorial Guinea, Estonia, Ethiopia, Fiji, France, Gabon, Georgia, Greece, Guatemala, Guinea, Guinea-Bissau, Honduras, Hungary, Iran (Islamic Republic of), Ireland, Italy, Jamaica, Kazakhstan, Kenya, Kiribati, Lao People's Democratic Republic, Latvia, Lesotho, Liberia, Lithuania, Luxembourg, Madagascar, Malawi, Malta, Martinique, Mauritania, Mongolia, Morocco, Mozambique, Myanmar, Nepal, Netherlands, New Zealand, Nicaragua, Niger, Pakistan, Papua New Guinea, Paraguay, Poland, Republic of Korea, Réunion, Romania, Russian Federation, Saint Vincent and the Grenadines, Serbia, Seychelles, Slovakia, Slovenia, South Africa, Spain, Sri Lanka, Sudan, Swaziland, Sweden, Tajikistan, The former Yugoslav Republic of Macedonia, Thailand, Timor-Leste, Togo, Tonga, Trinidad and Tobago, Turkmenistan, Uganda, United Kingdom of Great Britain and Northern Ireland, United Republic of Tanzania, Uruguay, Uzbekistan, Vanuatu, Venezuela, Viet Nam, Zambia, Zimbabwe.

V3 (In countries with no data, value-added has been estimated in the same way as V2, but using the average value-added per cubic metre of roundwood production from neighbouring countries). Countries and territories with such estimates (see numbers in italics):

Afghanistan, Albania, Algeria, Angola, Barbados, Chad, Cuba, Democratic People's Republic of Korea, Democratic Republic of the Congo, Egypt, Eritrea, French Guiana, Guadeloupe, Haiti, Lebanon, Libyan Arab Jamahiriya, Liechtenstein, Mauritius, Montenegro, New Caledonia, Panama, Peru, Republic of Moldova, Samoa, Somalia, Suriname, Syrian Arab Republic, Tunisia.

Notes – types of estimates:

V1 (In countries with gross output data and some value-added data, missing data has been estimated from gross output data in missing years (if available), based on the ratio of value-added to gross output in the years where data are available.) Countries and territories with such estimates (see numbers in italics): Albania, Armenia, Azerbaijan, Belarus, Croatia, Georgia, Kazakhstan, Latvia, Lithuania, Republic of Moldova, Russian Federation, Syrian Arab Republic, Tajikistan, Tonga, Turkmenistan, Viet Nam.

V2 (In countries with some value-added data, but no gross output data for the missing years, average value-added per cubic metre of sawnwood and wood-based panel production has been used to estimate the missing figures) Countries and territories with such estimates (see numbers in italics): Afghanistan, Algeria, Argentina, Bahrain, Bangladesh, Barbados, Belize, Benin, Botswana, Brazil, Burundi, Cambodia, Cameroon, Cape Verde, Central African Republic, Chile, Colombia, Costa Rica, Côte d'Ivoire, Cuba, Ecuador, Egypt, El Salvador, Eritrea, Estonia, Ethiopia, Fiji, Gabon, Germany, Ghana, Guatemala, Guyana, Honduras, Hong Kong SAR of China, India, Iran (Islamic Republic of), Iraq, Israel, Jamaica, Japan, Jordan, Kenya, Kuwait, Kyrgyzstan, Lao People's Democratic Republic, Lebanon, Macao SAR of China, Madagascar, Malawi, Malaysia, Mauritania, Mauritius, Mongolia, Montenegro, Morocco, Mozambique, Myanmar, Namibia, Nepal, New Zealand, Nicaragua, Niger, Nigeria, Occupied Palestinian Territory, Oman, Pakistan, Panama, Paraguay, Peru, Philippines, Portugal, Puerto Rico, Qatar, Réunion, Romania, Rwanda, Senegal, Serbia, Sierra Leone, Slovakia, South Africa, Sri Lanka, Sudan, Swaziland, Switzerland, The former Yugoslav Republic Macedonia, Thailand, Trinidad and Tobago, Tunisia, Turkey, Uganda, Ukraine, United Republic of Tanzania, Uruguay, Venezuela, Yemen, Zambia, Zimbabwe.

V3 (In countries with no data, value-added has been estimated in the same way as V2, but using the average value-added per cubic metre of sawnwood and wood-based panel production from neighbouring countries). Countries and territories with such estimates (see numbers in italics): Angola, Bahamas, Bhutan, Bosnia and Herzegovina, Brunei Darussalam, Burkina Faso, Chad, Congo, Democratic People's Republic of Korea, Democratic Republic of the Congo, Equatorial Guinea, French Guiana, Gambia, Guadeloupe, Guinea, Guinea-Bissau, Haiti, Liberia, Libyan Arab Jamahiriya, Mali, Martinique, New Caledonia, Papua New Guinea, Samoa, Solomon Islands, Somalia, Suriname, Togo, Uzbekistan, Vanuatu.

Notes – types of estimates:

V1 (In countries with gross output data and some value-added data, missing data has been estimated from gross output data in missing years (if available), based on the ratio of value-added to gross output in the years where data are available.) Countries and territories with such estimates (see numbers in italics): Albania, Armenia, Azerbaijan, Belarus, Czech Republic, Georgia, Kazakhstan, Latvia, Lithuania, Mongolia, Republic of Moldova, Russian Federation, Slovakia, Tajikistan, The former Yugoslav Republic of Macedonia, Tonga, Ukraine, Viet Nam, Yemen.

V2 (In countries with some value-added data, but no gross output data for the missing years, average value-added per ton of pulp and paper & paperboard production has been used to estimate the missing figures) Countries and territories with such estimates (see numbers in italics): Algeria, Argentina, Bahamas, Bahrain, Bangladesh, Barbados, Belgium, Belize, Benin, Bolivia, Bosnia and Herzegovina, Botswana, Brazil, Bulgaria, Burundi, Cambodia, Cameroon, Central African Republic, Chile, Colombia, Costa Rica, Côte d'Ivoire, Croatia, Cuba, Cyprus, Egypt, El Salvador, Eritrea, Estonia, Ethiopia, Fiji, Gabon, Germany, Ghana, Greece, Guatemala, Honduras, Hong Kong SAR of China, Hungary, India, Indonesia, Iran (Islamic Republic of), Iraq, Ireland, Israel, Italy, Jamaica, Japan, Jordan, Kenya, Kuwait, Kyrgyzstan, Lao People's Democratic Republic, Lebanon, Luxembourg, Macao SAR of China, Madagascar, Malawi, Malaysia, Malta, Mauritius, Morocco, Mozambique, Myanmar, Namibia, Nepal, New Zealand, Nicaragua, Niger, Nigeria, Occupied Palestinian Territory, Oman, Pakistan, Panama, Paraguay, Philippines, Poland, Puerto Rico, Qatar, Republic of Korea, Réunion, Romania, Saint Lucia, Senegal, Serbia, Sierra Leone, Slovenia, South Africa, Spain, Sri Lanka, Sudan, Swaziland, Switzerland, Syrian Arab Republic, Thailand, Trinidad and Tobago, Tunisia, Turkey, Uganda, United Republic of Tanzania, Uruguay, Venezuela, Zambia, Zimbabwe.

V3 (In countries with no data, value-added has been estimated in the same way as V2, but using the average value-added per tonne of pulp and paper & paperboard production from neighbouring countries). Countries and territories with such estimates (see numbers in italics): Angola, Democratic People's Rep. of Korea, Libyan Arab Jamahiriya, Saudi Arabia, United Arab Emirates, Uzbekistan.

Note: products from the forestry sub-sector (ISIC Division 02) comprise the following products (HS2002 code in brackets):

1) Roundwood

Wood fuel (440110)

Industrial roundwood (44.03.20/40/90)

2) Non-wood forest products

Mosses and lichens for bouquets, ornamental purposes (06.04.10)

Truffles, fresh or chilled (07.09.52)

Mushrooms other than Agaricus, fresh or chilled (07.09.59)

Mushrooms (excl. 07.13.31/33) and truffles, dried (07.12.39)

Brazil nuts, fresh or dried (08.01.20)

Chestnuts, fresh or dried (08.02.40)

Liquorice roots (12.11.10)

Ginseng roots (12.11.20)

Plants and parts, pharmacy, perfume, insecticide use n.e.s. (12.11.90)

Locust beans, locust seeds (12.12.10)

Lac (13.01.10)

Gum arabic (13.01.20)

Natural gum, resin, gum resin, balsam, not gum arabic (13.01.90)

Bamboos used primarily for plaiting (14.01.10)

Rattan used primarily for plaiting (14.01.20)

Maple sugar and maple syrup (17.02.20)

Truffles, prepared or preserved, not in vinegar (20.03.20)

Palm hearts, otherwise prepared or preserved (20.08.91)

Quebracho tanning extract (32.01.10)

Wattle tanning extract (32.01.20)

Balata, gutta-percha, guayule, chicle and similar gums (40.01.30)

Natural cork, raw or simply prepared (45.01.10)

Abaca fibre, raw (Musa textilis) (53.05.21)

Note: wood industry products comprise the following products (HS2002 code in brackets):

1) Primary processed wood products:

- Wood charcoal (44.02)
- Wood chips and particles, wood residues (44.01.20/30)
- Sawnwood (44.07)
- Wood-based panels (44.08/10/11/12)

2) Further processed wood products:

- Further processed sawnwood (44.09)
- Wooden wrapping and packing equipment (44.15/16)
- Wood products for domestic/decorative use (44.14/19/20)
- Builder's joinery and carpentry of wood (44.18)
- Other manufactured wood products (44.17/21)
- Prefabricated buildings (94.06)

Note: pulp and paper industry products comprise the following products (HS2002 code in brackets):

1) Pulp and recovered paper:

Woodpulp (47.01/02/03/04/05)

Other fibre pulp (47.06)

Recovered paper (47.07)

2) Paper and paperboard and further processed paper products (48)

Note: products from the forestry sub-sector (ISIC Division 02) comprise the following products (HS2002 code in brackets):

1) Roundwood

Wood fuel (440110)

Industrial roundwood (44.03.20/40/90)

2) Non-wood forest products

Mosses and lichens for bouquets, ornamental purposes (06.04.10)

Truffles, fresh or chilled (07.09.52)

Mushrooms other than Agaricus, fresh or chilled (07.09.59)

Mushrooms (excl. 07.13.31/33) and truffles, dried (07.12.39)

Brazil nuts, fresh or dried (08.01.20)

Chestnuts, fresh or dried (08.02.40)

Liquorice roots (12.11.10)

Ginseng roots (12.11.20)

Plants and parts, pharmacy, perfume, insecticide use n.e.s. (12.11.90)

Locust beans, locust seeds (12.12.10)

Lac (13.01.10)

Gum arabic (13.01.20)

Natural gum, resin, gum resin, balsam, not gum arabic (13.01.90)

Bamboos used primarily for plaiting (14.01.10)

Rattan used primarily for plaiting (14.01.20)

Maple sugar and maple syrup (17.02.20)

Truffles, prepared or preserved, not in vinegar (20.03.20)

Palm hearts, otherwise prepared or preserved (20.08.91)

Quebracho tanning extract (32.01.10)

Wattle tanning extract (32.01.20)

Balata, gutta-percha, guayule, chicle and similar gums (40.01.30)

Natural cork, raw or simply prepared (45.01.10)

Abaca fibre, raw (Musa textilis) (53.05.21)

Note: wood industry products comprise the following products (HS2002 code in brackets):

1) Primary processed wood products:

- Wood charcoal (44.02)
- Wood chips and particles, wood residues (44.01.20/30)
- Sawnwood (44.07)
- Wood-based panels (44.08/10/11/12)

2) Further processed wood products:

- Further processed sawnwood (44.09)
- Wooden wrapping and packing equipment (44.15/16)
- Wood products for domestic/decorative use (44.14/19/20)
- Builder's joinery and carpentry of wood (44.18)
- Other manufactured wood products (44.17/21)
- Prefabricated buildings (94.06)

Note: pulp and paper industry products comprise the following products (HS2002 code in brackets):

1) Pulp and recovered paper:

Woodpulp (47.01/02/03/04/05)

Other fibre pulp (47.06)

Recovered paper (47.07)

2) Paper and paperboard and further processed paper products (48)
