REVISION OF THE CLASSIFICATION OF FOOD AND FEED:

CLASS C: PRIMARY ANIMAL FEED COMMODITIES

(AT STEP 4)

**(Prepared by the Electronic Working Group chaired by the United States of America
and co-chaired by the Netherlands)**

Codex members and Observers wishing to submit comments at Step 3 on the revised feed groups under Type 11 (Appendices I and II) should do so as instructed in CL 2019/01-PR.

Circular letters are available on the Codex webpage/Circular Letters:

<http://www.fao.org/fao-who-codexalimentarius/resources/circular-letters/en>

This document should be read in conjunction with relevant working documents and circular letters under Agenda Items 7(b) and 7(c).

BACKGROUND

1. Background on the discussion of the revision of the *Classification of Food and Feed* (CXM 4-1989) can be found in the reports of the 36th – 50th sessions of the Codex Committee on Pesticide Residues (CCPR) including relevant sessions of the Codex Alimentarius Commission (CAC) held from 2004 to 2018.¹
2. The practice adopted by CCPR in the revision of the Classification is to retain the revision of the commodity groups (e.g. fruit commodity groups, vegetable commodity groups, etc.) waiting for the final compilation of the related commodity groups and the corresponding tables on examples of representative commodities for inclusion in the *Classification of Food and Feed* and the *Principles and Guidance on the Selection of Representative Commodities for the Extrapolation of Maximum Residue Limits for Pesticides to Commodity Groups* (CXG 84-2012) respectively.²
3. CCPR50 (2018) agreed to: (i) align the structure of Class C based on the water content of feeds (high water content versus low water content) so as to facilitate crop grouping and extrapolation of maximum residue limits (MRLs) and (ii) group all feed commodities under Class C and consequently transfer processed feed commodities from Class D (Processed Food Commodities of Plant Origin) to Class C (Primary Animal Feed Commodities). CCPR50 agreed that the structure based on water content would allow the allocation of different types of feeds e.g. forage, silage, etc. under the relevant groups and sub-groups. CCPR50 therefore agreed with the structure for Class C and that commodities to be included in the groups and subgroups under Type 11 would be further discussed in the Electronic Working Group (EWG) on the revision of the Classification for consideration at CCPR51.³
4. The EWG (i) continued the work on the revision of Class C based on the structure⁴ agreed by CCPR50; (ii) considered the addition of new commodities to Class C; and (iii) considered the addition of subgroups to the groups of feed that would include processed commodities in order to group all feed commodities under Class C which may involve the relocation of commodities from Class D to Class C in accordance with the Terms of Reference (TOR) given to it by CCPR50.⁵

¹ Reports of CCPR and CAC meetings are available at:

³ REP18/PR, paras. 122-124

⁴ REP18/PR, Appendix X

⁵ REP18/PR, para. 129 (points i - iii)

5. In allocating new commodities to the different groups and subgroups in Class C, including the transferring of processed commodities from Class D to Class C, the EWG has included a commodity only in one group or subgroup to avoid confusion of having two different CXLs for the same commodity in accordance with the approach⁶ taken to the revision of the Classification by CCPR.
6. The EWG considered Class C which includes one Type and three Groups as follows:

- Class C
 - Type 11
 - Group 50, Legume feed products
 - Group 51, Cereal grains and grasses (including pseudo-cereals) feed products
 - Group 52, Miscellaneous feed products

In addition to the revised structure, new animal feed commodities developed within the EWG are highlighted in Appendix I with new commodity codes.

7. CCPR agreed that forage commodities, although not typically traded internationally, would be maintained in the Classification since they are used to calculate livestock dietary burdens with the use of the estimated supervised trials median residue (STMR) and highest residue (HR) values. In addition, commodities previously identified as "fodder" have been revised to include more specific terms for animal feeds, such as "hay", "straw" and "silage".

CONCLUSIONS

8. The revised Class C includes a revised structure as agreed by CCPR50. The revised Type 11 includes an additional subgroup for processed products (such as meal, hulls, dried pulps, molasses), and a number of additional commodities for groups 50, 51 and 52. Addition of new commodities or relocation of commodities from Class D to Class C follows the approach agreed by CCPR50 on the revision of the Classification. Specific discussion on the transferring of commodities from Class D to Class C are described in Agenda Item 7(c). All proposed changes are in shaded font (see Appendix I).
9. Canada proposed separating out grasses from cereal grains because of the difficulty in identifying appropriate representative commodities. Grasses that are included in Group 51 include Italian ryegrass, ryegrass, and pangula with a cross reference to subgroup of hay of grasses for bermudagrass, fescue, bluegrass, brome grass and darnel. Grasses may also be appropriately separated into warm season and cool season grasses (see Appendix II for potential warm season and cool season grasses).

RECOMMENDATIONS

10. CCPR is invited to consider the revised Class C (Appendix I) taking into account the conclusions and recommendations in relation to the revision of Class D and the proposals for the transfer of processed commodities from Class D to Class C in the relevant working documents under Agenda Items 7(b) and 7(c) as well as comments submitted by Codex members and observers in reply to the corresponding circular letters.
11. In addition, CCPR is invited to consider comments on the separation of grasses from cereals grains (paragraph 9 and Appendix II) and how this proposal could be accommodated in the revised Class C.

CLASS C PRIMARY FEED COMMODITIES

For the purpose of the Codex Alimentarius the term "primary feed commodity" means the product in or nearly in its natural state intended for sale to:

(a) the stock farmer as feed which is used without further processing for livestock animals or after silaging or similar farm processes.

(b) to the animal feed industry as a raw material for preparing compounded feeds.

Legume feeds

Class C

Type 11 Primary feed commodities of plant origin Group 050 Group Letter Code AL

Group 050. Legume animal feeds include various species of leguminous plants used for animal forage, grazing, hay or silage, with or without seed and processed products. Several species are grown exclusively for animal feeding purposes, whereas some others are grown primarily as food crops. The "waste" parts of the latter crops are often used as animal feed, either in the fresh form or as hay.

The entire commodity may be consumed by livestock animals.

Portion of the commodity to which the MRL applies (and which is analysed): Whole commodity as presented for wholesale or retail distribution.

In view of the wide range of moisture contents in most animal feeds, except straws, moving in commerce, the MRLs should preferably be set and expressed on a "dry-weight" basis.

A "dry-weight" basis implies that the commodity is analysed for pesticide residues as received, that the moisture content is determined, preferably by a standard method for use on the relevant commodity, and the residue content is then calculated as if it were wholly contained in the dry matter.

The residues are expressed on a dry-weight basis if not otherwise stated. To avoid confusion caused by the not always consistent commodity description, the "dry-weight" basis, will be indicated, if relevant, with the designation "dry-weight" after the residue figure e.g.

pea vines (green) ;	x mg/kg dry weight
pea hay ;	x mg/kg dry weight

Group 051 Cereal grains and grasses (including pseudocereals) feed products

Class C

Type 11 Primary feed commodities of plant origin

Group 051 Group Letter Code AS (straws and hay) AF (forage)

The forage, hay and straw of cereal grains and processed products are derived from various plants of the grass family (*Gramineae*).

Cereal grains are grown to a limited extent as a forage crop. The immature crop is fed to livestock animals as succulent forage or as silage.

The cereal grain crops are mainly grown for human food or raw material for preparing food products. The "waste" parts remaining after harvest of the grain kernels (stems, stalks, leaves and empty ears) are extensively used and distributed for animal feeding purposes, in the form of hay or straw.

Several other species of the grass family are exclusively grown as forages crops. These crops are either used for grazing or are prepared for wholesale or retail distribution in the form of grass silage (in general one or more cuttings from immature plants), as artificially dried grass or as hay.

The entire commodity may be consumed by livestock animals.

Portion of the commodity to which the MRL applies (and which is analysed): Whole commodity, as presented for wholesale or retail distribution.

In view of the range of moisture contents in the animal feeds of this group, moving in commerce, the MRLs should preferably be set and expressed on a "dry-weight" basis.

A "dry-weight" basis implies that the commodity is analysed for pesticide residues as received, that the moisture content is determined, preferably by a standard method for use on the relevant commodity, and that the residue content is then calculated as if it were wholly contained in the dry matter.

The residues on the dry commodities of this group, e.g. straws and hays, are expressed on the commodity as such.

Forage: Crops grown exclusively for animal feed. These crops are either used for grazing or are prepared as silage or as hay.

Hay: Coarse feed for livestock animals, especially cattle, horses and sheep, such as straw, hay, maize, stalks (stover) etc. e.g. Maize forage: whole green plant, prior to maturity (including the immature or nearly mature cobs).

Maize hay: stover or whole stalks (with ears removed) remaining after the harvest of the mature and sun-dried cobs.

In case the Committee agrees to create Subgroup 051D, Grasses, the following text will be included:

Code No. **Commodity**

AS XXXX **Subgroup of Grasses**

Grasses that are currently included in Group 051B include Ryegrass, Italian and Pangula. There is a cross reference to subgroup of hay of grasses for bermudagrass, fescue, bluegrass, brome grass and darnel. Grasses may also be appropriately separated into warm season and cool season grasses. See Appendix II for potential grass commodities separated into cool and warm season grasses.

Group 052 Miscellaneous Feed Products

Class C

Type 11 Primary feed commodities of Plant origin**Group 052 Group Letter Codes AM (hay and processed products) AV (forage)**

Group 052. Miscellaneous forage, hay crops and processed products, are derived from various kinds of plants except leguminous and grassy plants (family *Gramineae*). However, for convenience, the hay and forage of grasses for sugar production are included in this group. Some of the crops listed in this group are primarily grown for human food or as raw material for preparing food (e.g. sugar beet) and the "waste" material of such crops is used as animal feed.

The entire commodity may be consumed by livestock animals, either in a succulent form, as silage or in the form of hay.

Portion of the commodity to which the MRL applies (and which is analysed): Whole commodity as presented for wholesale or retail distribution. In view of the wide range of moisture contents in the animal feeds of this group moving in commerce the MRLs should, if relevant, preferably be set and expressed on a "dry-weight" basis, see explanation in Group 050 Legume animal feeds.

Group 052 Miscellaneous Feed Products

This group is divided into 3 subgroups:

	Code
Subgroup 052A: Products with high water content (forage, beet tops)	AV
