FOR FOOD ADDITIVES**
CXG 36-1989

ADOPTED 1989
AMENDED 2025

CXG 36-1989

History of the guideline

This guideline is amended regularly. The 2025 amendments were adopted during the Forty-eighth Session of the Codex Alimentarius Commission.

This publication was redesigned and published in 2025.

Amendments and revisions made prior to 2025:

Amended in 2018, 2019, 2021, 2023 and 2024.

Revised in 2008.

Adopted in 1989.

1 Introduction

Background

The International Numbering System for Food Additives (INS)ⁱ is intended as a harmonized naming system for food additives as an alternative to the use of the specific name, which may be lengthy. Inclusion in the INS does not imply approval by Codex for use as food additives. The list may include those additives that have not been evaluated by the Joint FAO/WHO Expert Committee on Food Additives (JECFA) or are not included in the *General standard for food additives* (CXG 192-1995).¹

The INS does not include flavourings,^{ii, 2} which have a JECFA number as identifier, chewing gum bases, and dietetic and nutritive additives. Enzymes which function as food additives have been included in an 1100 series.

Explanatory notes on the layout of the International Numbering System

The INS in numerical order (Section 3: “List in numerical order”) is set out in four columns giving the identification number, the name of the food additive, the functional classes and the technological purposes. The identification number usually consists of three or four digits such as 100 for curcumins and 1001 for choline salts and esters. However, in some instances the number is followed by an alphabetical suffix, for example, 150a identifies Caramel I – plain caramel and 150b identifies Caramel II – sulphite caramel. The alphabetical designations are included in order to further characterize the different classes of additives (e.g. caramel produced by different processes).

Under the column listing the name of the food additive, some additives are further subdivided by numerical subscripts. For example, curcumins are subdivided into (i) curcumin and (ii) turmeric. These identifications identify subclasses (in this case of curcumins) which are covered by separate Codex specifications.

The name of the food additive is sometimes followed by an additional name in parentheses. The parenthetical name is optional, and may be used, when necessary, to indicate another commonly associated name or synonym for the additive, for example INS 235 Natamycin (Pimaricin). Not all synonyms are listed. A footnote can be used to clarify the use of parentheses. The name of an additive is sometimes, after a comma, followed by a description of the additive, for example INS 161h(i) Zeaxanthin, synthetic.

The various technological purposes of the food additives are included in the INS in a fourth column. The purposes listed are indicative rather than exhaustive. The technological purposes are grouped under more descriptive functional class titles which are intended to be meaningful to consumers. These are listed in Section 2: “Table of functional classes, definitions and technological purposes” along with simple definitions of the function performed.

A single food additive can often be used for a range of technological purposes in a food, and it remains the responsibility of the manufacturer to declare the most descriptive functional class in the list of ingredients.

In preparing the INS in numerical order, an effort has been made to group food additives with similar purposes together. However, because of the extension of the list and its open nature, most of the three-digit numbers have already been allocated. Consequently, the positioning of a food additive in the list can no longer be taken as an indication of the purpose, although this will often be the case.

ⁱ Section 3: “List in numerical order” and Section 4: “List in alphabetical order” of the International Numbering System for food additives are regularly updated.

ⁱⁱ Flavourings are covered by the *Guidelines for the use of flavourings* (CXG 66-2008).

The food additives that have been allocated an ADI by JECFA, may be found at: <https://www.fao.org/food-safety/scientific-advice/jecfa/en> and <https://apps.who.int/food-additives-contaminants-jecfa-database/>.

JECFA specifications adopted by the Codex Alimentarius Commission are listed in *List of Codex specifications for food additives* (CXA 6-2025)³ that can be found on the Codex website at: www.fao.org/fao-who-codexalimentarius/codex-texts/miscellaneous/en/

Open nature of the list

Because of its primary purpose of identification, the INS is an open list subject to the inclusion of additional additives or removal of existing ones on an ongoing basis.

2 Table of functional classes, definitions and technological purposes

Functional classes	Definition	Technological purpose
1. Acidity regulator	A food additive, which controls the acidity or alkalinity of a food.	acidity regulator, acid, acidifier, alkali, base, buffer, buffering agent, pH adjusting agent
2. Anticaking agent	A food additive, which reduces the tendency of components of food to adhere to one another.	anticaking agent, anti-stick agent, drying agent, dusting agent
3. Antifoaming agent	A food additive, which prevents or reduces foaming.	antifoaming agent, defoaming agent
4. Antioxidant	A food additive, which prolongs the shelf-life of foods by protecting against deterioration caused by oxidation.	antioxidant, antioxidant synergist, antibrowning agent
5. Bleaching agent	A food additive (non-flour use) used to decolourize food. Bleaching agents do not include pigments.	bleaching agent
6. Bulking agent	A food additive, which contributes to the bulk of a food without contributing significantly to its available energy value.	bulking agent, filler
7. Carbonating agent	A food additive used to provide carbonation in a food.	carbonating agent
8. Carrier	A food additive used to dissolve, dilute, disperse or otherwise physically modify a food additive or nutrient without altering its function (and without exerting any technological effect itself) in order to facilitate its handling, application or use of the food additive or nutrient.	carrier, carrier solvent, nutrient carrier, diluent for other food additives, encapsulating agent

Functional classes	Definition	Technological purpose
9. Colour	A food additive, which adds or restores colour in a food.	colour, decorative pigment, surface colourant
10. Colour-retention agent	A food additive, which stabilizes, retains or intensifies the colour of a food.	colour-retention agent, colour fixative, colour stabilizer, colour adjunct
11. Emulsifier	A food additive, which forms or maintains a uniform emulsion of two or more phases in a food.	emulsifier, plasticizer, dispersing agent, surface active agent, crystallization inhibitor, density adjustment agent (flavouring oils in beverages), suspension agent, clouding agent
12. Emulsifying salt	A food additive, which, in the manufacture of processed food, rearranges proteins in order to prevent fat separation.	emulsifying salt, emulsifying salt synergist, melding salt
13. Firming agent	A food additive, which makes or keeps tissues of fruit or vegetables firm and crisp or interacts with gelling agents to produce or strengthen a gel.	firming agent
14. Flavour enhancer	A food additive, which enhances the existing taste and/or odour of a food.	flavour enhancer, flavour synergist
15. Flour treatment agent	A food additive, which is added to flour or dough to improve its baking quality or colour.	flour treatment agent, flour bleaching agent, flour improver, dough conditioner, dough strengthening agent
16. Foaming agent	A food additive, which makes it possible to form or maintain a uniform dispersion of a gaseous phase in a liquid or solid food.	foaming agent, whipping agent, aerating agent
17. Gelling agent	A food additive, which gives a food texture through formation of a gel.	gelling agent
18. Glazing agent	A food additive, which when applied to the external surface of a food, imparts a shiny appearance or provides a protective coating.	glazing agent, sealing agent, coating agent, surface-finishing agent, polishing agent, film-forming agent
19. Humectant	A food additive, which prevents food from drying out by counteracting the effect of a dry atmosphere.	humectant, moisture-retention agent, wetting agent
20. Packaging gas	A food additive gas, which is introduced into a container before, during or after filling with food with the intention to protect the food, for example, from oxidation or spoilage.	packaging gas
21. Preservative	A food additive, which prolongs the shelf-life of a food by protecting against deterioration caused by microorganisms.	preservative, antimicrobial preservative, antimycotic agent, bacteriophage control agent, fungistatic agent, antimould and antirope agent, antimicrobial synergist
22. Propellant	A food additive gas, which expels a food from a container.	propellant

Functional classes	Definition	Technological purpose
23. Raising agent	A food additive or a combination of food additives, which liberate(s) gas and thereby increase(s) the volume of a dough or batter.	raising agent
24. Sequestrant	A food additive, which controls the availability of a cation.	sequestrant
25. Stabilizer	A food additive, which makes it possible to maintain a uniform dispersion of two or more components.	stabilizer, foam stabilizer, colloidal stabilizer, emulsion stabilizer, stabilizer synergist, binder
26. Sweetener	A food additive (other than a mono- or disaccharide sugar), which imparts a sweet taste to a food.	sweetener, intense sweetener, bulk sweetener
27. Thickener	A food additive, which increases the viscosity of a food.	thickener, bodying agent, binder, texturizing agent, thickener synergist

Codex Alimentarius

A collection of international food standards developed to protect consumer health and ensure fair practices in the food trade. Codex standards are adopted by the Codex Alimentarius Commission, an intergovernmental body with 189 Members, established by FAO and WHO. The standards are recognized by the World Trade Organization as the benchmark for the safety of internationally traded food.
