

**QATAR:**

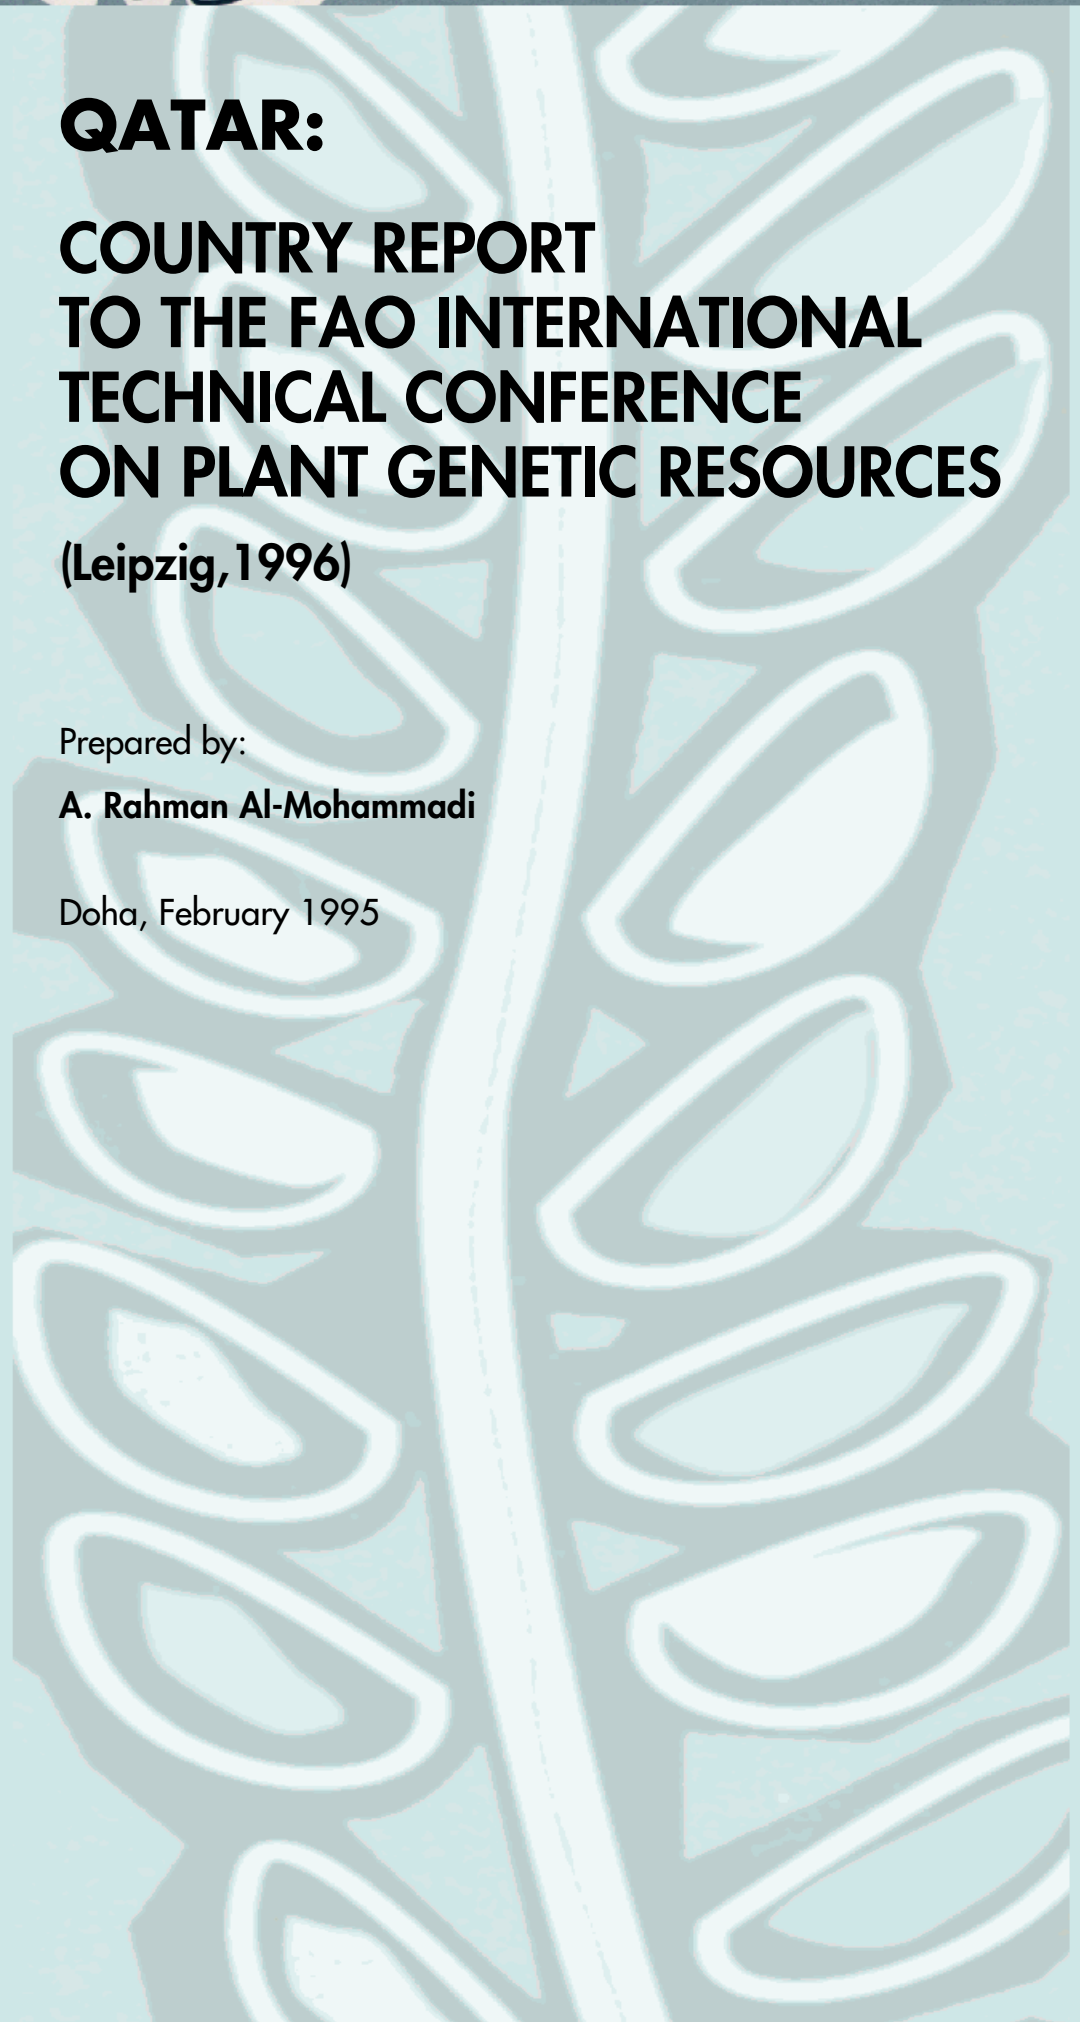

**COUNTRY REPORT  
TO THE FAO INTERNATIONAL  
TECHNICAL CONFERENCE  
ON PLANT GENETIC RESOURCES**

**(Leipzig, 1996)**

Prepared by:

**A. Rahman Al-Mohammadi**

Doha, February 1995

## Note by FAO

This Country Report has been prepared by the national authorities in the context of the preparatory process for the FAO International Technical Conference on Plant Genetic Resources, Leipzig, Germany, 17-23 June 1996.

The Report is being made available by FAO as requested by the International Technical Conference. However, the report is solely the responsibility of the national authorities. The information in this report has not been verified by FAO, and the opinions expressed do not necessarily represent the views or policy of FAO.

The designations employed and the presentation of the material and maps in this document do not imply the expression of any opinion whatsoever on the part of the Food and Agriculture Organization of the United Nations concerning the legal status of any country, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

## Introduction to the State of Qatar and Its Agricultural Sector

**Size:** It covers an area of about 11,400 square kilometers.

**Location:** Latitude: 24°27' and 26°10' North. Longitude: 50°45' and 51°40' East.

**Physiographic features:** Most of Qatar's surface is flat, hills and sand dunes are present on both South East and West of Qatar.

**Climatic features:** It is a typical arid desert climate with long hot and dry summer, winter is mild with some rain.

**Population:** It was estimated to be around 532,719 in the year of 1992.

**Farming system and crop:** Date palm, alfalfa and some vegetables are grown successfully in Qatar, but it never covers the full requirement of the local market, therefore, the imported products from other countries are the only way to cover the shortage.

**Forest:** Not available, but some native plants and shrubs are spread over the desert.

The total number of registered farm was 1,089 in the year of 1992 with a total area of 25,580 hectares of which only 15,350 ha is suitable for cropping.

Area of the farms varies from less than one hectare to over a hundred of hectares, and most of the productive farms are rented from the Qatari owners to foreigners.

Seeds and most of other planting inputs are imported from all over the world. Local companies are acting as agent for the international firms.

Forage production, "mainly alfalfa" is increasing due to the better marketing and higher prices.

### Indigenous Plant Genetic Resources

Even there is no forests in Qatar, some native plant materials are of traditional importance and they are adapted to the local conditions (see attached list.).

## National Conservation Activities

Some areas in the country "both onshore and offshore" are announced as a natural protected area in which the natural life is maintained, for example Khor Al Udaid in South East of Qatar.

Yet, there is no other activities to store genetic materials for the wild varieties. Some studies were carried out in the past on the classification of natural flora in Qatar, e.g.:

- Ecology & Flora of Qatar, K.H. Batanouny, Center of Scientific & Applied Research, University of Qatar.
- Wild Plants of Qatar, Arab Organization for Agricultural Development, Ministry of Municipal Affairs and Agriculture.

Annual reports are also published covering the cultivated field crops experiments and multiplication. Generation Process are also conducted to increase the area covered with some type of plants e.g. mangroves.

## Plant Breeding Programmes

It concentrates on adapting of imported germplasm to increase production, mainly conducted and funding the government. The produced seeds are made available to all farmers.

## Lines of authority dealing with genetic resources and/or related activities

Ministry of Municipal Affairs and  
Agriculture\Department of Agricultural  
and Water Research  
P.O. Box 1967, Doha, Qatar
