**PREFACE**

At the end of the 2007/08 Agricultural Year, the Office of the Chief Government Statistician, (OCGS) in collaboration with National Bureau of Statistics (NBS) and Ministries of Agriculture and Natural Resources; Livestock and Fisheries conducted the 2007/08 Agricultural Sample Census. This is the second Sample Census of Agriculture to be carried out in Zanzibar, the first one was conducted in 2002/03 Agricultural year

It is considered that this census is one of the largest to be carried out in Africa and indeed in many other countries of the world. The census collected detailed data on crop production, crop marketing, crop storage, livestock production, fish farming, and poverty indicators. In addition to this, the census was large in its coverage as it provides data that can be disaggregated at district level and thus allow comparisons with the 2002/03 National Sample Census of Agriculture. The census covered smallholders in rural areas only and large scale farms. This report presents regional data disaggregated to district levels. It was very difficult to discuss all variables collected in a single report hence the analysis was based on the most important smallholder variables. The rest of the variables are found in the attached annex of table of results. The analysis in the report includes trend analysis using data from the previous censuses and surveys, particularly the 2002/03.

The extensive nature of the census in relation to its scope and coverage is a result of the increasing demand for more detailed information to assist in the proper planning of the agricultural sector and in the administrative decentralization of planning to district level. It is hoped that this report will provide new insights for planners, policy makers, researchers and others involved in the agricultural sector in order to improve the prevailing conditions faced by agricultural households in the country.

On behalf of the Government of Tanzania Zanzibar, I wish to express my appreciation for the financial support provided by the development partners, in particular, the Department for International Development (DFID) the European Union as well as DFID, UNDP, the Japanese Government through the Japan International Cooperation Agency (JICA) and others who contributed through the pool fund mechanism.

Finally, my appreciation goes to all those who in one-way or the other, have contributed to the success of the survey. In particular, I would also like to mention the enormous effort made by the Planning Group composed of professionals from the Agricultural and Environmental Statistics

Section of the Office of Chief Government Statistician (OCGS), Agricultural Statistics Department of the National Bureau of Statistics (NBS), Ministry of Agriculture and Natural Resources, Ministry of Livestock and Fishery Zanzibar. Other are Ministry of Food Security and Cooperatives, Ministry of Livestock Development and Fisheries, Ministry of Water and Irrigation, the Prime Minister's Office, Regional Administration and Local Government, Ministry of Industries, Trade and Marketing in Tanzania Mainland and the Food and Agriculture Organization of the United Nations and the Censuses and Surveys Technical Working Group (CSTWG).

Additionally, I would like to extend my sincere gratitude to all professional staff of the Office of the Chief Government Statistician and National Bureau of Statistics, Mainland, the sector Ministries of Agriculture and Natural Resources the Consultants as well as Regional and District Supervisors and field enumerators for their commendable work. Certainly, without their dedication, the census would not have been such a success.

Mr. Mohamed Hafith Rajab  
Chief Government Statistician  
Office of the Chief Government Statistician, Zanzibar  
Zanzibar

**EXECUTIVE SUMMARY**

Agriculture is an important economic sector of the Zanzibar economy in terms of food production, employment generation, production of raw materials for industry, and generation of foreign exchange earnings. The Agricultural Sector produces about 30.8 percent of GDP (Economic Survey, 2009) and the contribution of crops were estimated to be 20.8 percent.

In 2007, the Government of Tanzania launched the Agriculture Sample Census as an important part of the Poverty Monitoring Master plan which supports the production of statistics for advocacy of effective public policy, including poverty reduction, access to services, gender, as well as the standard production data normally collected in an agriculture census.

The 2007/08 Agriculture Sample Census was designed to meet the data needs of a wide range of users down to district level including policy makers at local, district, and national levels, rural development agencies, funding institutions, researchers, NGOs, farmers organizations, etc. This report provides detailed description of the state of the livestock sub-sector in Zanzibar for the agriculture year 2007-2008 based mainly on smallholder farms.

Permanent crops occupied an area of 78,494 ha, which is higher than 32,120 recorded in 2002/03 but in terms of proportion it has remained the same at 42%. The largest area (47,991 ha, 61%) was grown to other crops followed by banana (14,011 ha; 18%), and coconut (8058 ha; 10%) The three leading districts both in terms of percent of area planted and average planted area per household with permanent crops were Mkoani (14%, 0.69 ha); Wete (14.4%, 0.78 ha), and Central (14%, 0.91 ha).

Mkoani (3,312 ha, 21%), Chakechake (2,342 ha, 15%), and Central (2,186 ha, 14%) were the three districts with the highest percent of the total area planted with banana as well as average planted area per household planted with the crop. Central district recorded the highest percent (19 %) of the total area planted with coconuts followed by North 'B' (17%) and West and Wete districts each(16%).

Wete and Mkoani district respectively accounted for 26% and 22% of the total area planted with cloves.. Central district accounted for almost over a third (37%) of the area planted with mangoes. About 50 percent (48.5%) of the area planted with oranges was recorded in Central district. Central district accounted for 51 percent of the total area planted with sugar cane followed by Micheweni (18 %).

Overall, irrigated farming is quite limited with only 5% (2,777 ha) of the land under irrigation while 95 (49,681 ha) of the land is not. The three leading districts with the highest percent of irrigated land were West (927 ha, 33%) closely followed by Central (757 ha, 27%), and North 'B' (348 ha, 13%). West District had the largest number (3203, 36%) of households practising irrigation, followed by Central and North 'B' district with 2,249(25%) and 1,069(12%) respectively.

Cereals (33,704ha, 64%%) represented the largest area planted with crops followed by roots and tubers (11,899 ha, 23%), fruit and vegetables (3,946 ha, 8%). Specifically, the three leading crops with the largest area planted with irrigation were paddy (386 ha, 30%), tomatoes (235 ha, 38%) and egg plant (141 ha, 41%) in short rainy season.

A total of 5,482 households practised irrigation out of which 1,774 (32%) used rivers as the main source of water for irrigation followed by canal (1,291 households, 23.5%), and dam (645 households, 11.8%).

Generally, the importance of source of water for irrigation varied greatly between districts. Thus rivers, for example, were important source of water for irrigation in West, Micheweni, and Mkoani districts. Wells and canals were equally important sources of water in North 'B' district. Canals were important source of irrigation water in South district while dams were the main source of water for Central district.

Also, the importance of dams and to some extent wells was only limited to some districts. Hand bucket was the most common method used to obtain water for irrigation as it accounted for 53% of all households using different methods of obtaining water for irrigation followed by gravity (1,165 households, 24%), and motor pump (934 households, 19%). However, except for West district where gravity was the main method used for obtaining irrigation water, hand bucket remained the most important source of obtaining irrigation water in the other remaining districts.

Access to inputs among farming households was rather limited with only 44 percent (18,397) of the total households that growing crops in short rainy season. The propotion of households that used different inputs in long rainy season were 23,127 representing only 26 percent of the crop growing household in this season. Oganic fertilizer use accounted 41 percent of the total households using different inputs in short rainy season, this followed by use of improved seeds 6,500 households (35%), use of inorganic fertliser 2,899 (16%), the use of fungicides accounted only 508 (3%)

households. . In long rainy season the highest percent of households had access to organic and inorganic fertilizers each accounted 29 percent, followed by those who had access to improved seeds (27%). In contrast, the highest percent of households had no access to improved seeds and this presents 84 and 93 percents of the total households that growing crops for for short and long rainy seasons respectively..

Cereals accounted for the largest are planted with inorganic fertilizer (1,589 ha, 54%), followed by root and tubers (682ha,23%) of which the larger proportion was used for sweet potatoes production, fruits and vegetables (571 ha, 20%), pulses (57 ha, 2%), On the other hand, cash crops and oil nuts were produced without use of inorganic fertilizer.

The total number of households that reported selling crops was 45,013 (48% in Short rainy and 52% in Long rainy seasons). In total the largest number of households reported selling crops was recorded in Central District (8,907 households) followed by North 'A' (7,781 households) and West District (6,468 households). The most important problem faced by households in marketing their crops was low open market price (42,743 households, 35%) followed by crop market being far (4,728 households, 4%), and high transport cost (4,055 households, 3%). On the other hand, marketing problems reported by the lowest proportion of households were cooperative problems (51 households, 0.04%), farmer association problems (133 households, 0.11%), and trade union problems (321 households, 0.26%).

Sale of food crops was the main source of household finances as it was reported by 31 percent (41,491%). The other sources in order of importance were fishing (19,744 households, 15%), wages and salaries (16,720 households, 13%), business income (16,913 households, 13%), and other casual cash earnings (13,082 households, 10%).

About 23,200 (53%) from the total household received extention service reported government as the main source of extension advice followed by neighbour (31%), radio/television/newspaper (27%) large scale farmer (17%), NGO/Development project (11%), and cooperative (6%) The three most adopted technologies by households were spacing (28,927 households, %) presenting 66percent from the total households that received crop extension, this followed by organic fertilizer use (27,718 households, and improved seeds (25,400 households

## **1.0 BACKGROUND INFORMATION**

Agriculture is an important economic sector of the Zanzibar's economy as it provides the main source of food and employment. Moreover, it serves as an important source of raw material for industries and foreign exchange. The agricultural sector prod, produces about 30.7 percent of Gross Domestic Product (GDP) (Economic Survey, 2008). Farmers produce a wide variety of food and cash crops as well as fruits, vegetables and spices.

This report covers the crop sector. The result of this census serves as baseline for future agriculture censuses and surveys. This report is organized in four main sections namely; Introduction, Results, Conclusion and Appendices. The definitions relating to all aspects of this report can be found in the questionnaire

## **2.0 INTRODUCTION**

This part of the report provides an overview of the National Sample Census of Agriculture (NSCA), carried out in the rural areas of Zanzibar during the 2007/08 agricultural year. It details the background and the rationale for carrying out the NSCA in 2007/08 agricultural year.

### **2.1 Rationale for Conducting the National Sample Census of Agriculture**

The Government of Tanzania has embarked on various plans geared to eradicate poverty by the year 2025 and Zanzibar year 2020. In order to facilitate intervention and monitoring activities of the Poverty Monitoring Master Plan, the government has planned a series of censuses and surveys to assist in policy formulation, planning and to track changes in the wellbeing of the population of Tanzania Mainland and Zanzibar. In this Master Plan, A series of Agriculture Surveys have been planned, the first one was undertaken in 2002/03 agriculture year, the second is planned for the year 2007/08.

Demands for reliable and timely agriculture data have become significantly increasing for monitoring outcomes and progress of the poverty monitoring tools like the Agricultural Sector Development Programme (ASDP) and performance of respective MDAs (ASLMs). Following the decentralization of the Government's administration and planning functions, there has been a pressing need for agriculture and rural development data disaggregated at regional and district level. The provision of district level estimates will provide essential baseline information on the state of agriculture that support decision making by the Local Government Authorities and in the

design of District Agricultural Development and Investment Projects (DADIPs). The increase in investment is an essential element in the national strategy for growth and reduction of poverty.

## **2.2 Census Objectives**

The 2007/08 Agriculture Sample Census was designed to meet the data needs of a wide range of users down to district level including policy makers at local, regional and national levels, rural development agencies, funding institutions, researchers, NGOs, farmer organisations, etc. The dataset is both more numerous in its sample and detailed in its scope to meet the user demand.

The census was carried out in order to:

- Identify structural changes if any, in the size of farm household holdings, crop and livestock production, farm input and implement use. It also seeks to determine if there are any improvements in rural infrastructure and the level of agriculture household living conditions;
- Provide benchmark data on productivity, production and agricultural practices in relation to policies and interventions promoted by the Ministry of Agriculture and Natural Resources and others stakeholders
- Obtain data that will be used to address specific issues such as: food security, rural poverty, gender, agro-processing, marketing, service delivery, etc.

## **2.3 Census Coverage**

The census was conducted for both large and small scale farms. This report covers small scale farms in details such as total crop growing households, total planted area during short and long rainy seasons. The overall sample for small holders in 2007/08 Agriculture Sample Census had a total of 317EAs. The data were collected from a sample of 4,755 rural agriculture households.

Data were also collected from 38 Large Scale Farms on a complete enumeration basis.

### **2.3.1 Census scope**

The census covered agriculture households in detail as well as many other aspects of rural development. It was conducted using three different questionnaires:

- Small scale farm questionnaire
- Community level questionnaire
- Large scale farm questionnaire

The small scale farm questionnaire was the main census instrument and it included questions related to crop and livestock production and practices; population demographics; access to services, community resources and infrastructure; and issues on poverty and gender.. The main topics covered were:

- Household demographics and activities of the household members
- Land access/ownership/tenure and use
- Crop and livestock production and productivity
- Access to inputs and farming implements
- Access and use of credit
- Access to infrastructure (roads, district and regional headquarters, markets, advisory services, schools, hospitals).
- Crop marketing, storage and agro processing
- Fish farming and beekeeping.
- Investment activities ( irrigation structures, water harvesting, erosion control, fencing)
- Off farm income and non agriculture related activities
- Households living conditions (housing, sanitary facilities )
- Poverty Indicators

The community level questionnaire was designed to collect village level data such as access and use of common resources, and seasonal farm gate price. The Large Scale Farm questionnaire was administered to large farms either privately or corporately managed.

### **2.3.2 Main Activities Undertaken**

The main focus at all stage of census execution was on data quality and this is emphasized all the time. The main activities undertaken include:

- Census organization
- Tabulation plan preparation
- Sample design
- Design of census questionnaires and other instruments
- Pilot-test
- Training of trainers, supervisors and enumerators
- Information Education and Communication (IEC) campaign

- 
- Data Collection
  - Field supervision and consistency checks
  - Data processing:
    - Scanning
    - Structure formatting application
    - Batch validation application
    - Manual data entry application
    - Tabulation preparation using SPSS and Excel
  - Table formatting and charts using Excel, map generation using Arc GIS and Excel
  - Report preparation using Word and Excel

## **2.4 Census Methodology**

### **2.4.1 Census Organisation**

The Census was conducted by the Office of the Chief Government Statistician (OCGS) in collaboration with the National Bureau of Statistics (NBS), Ministries of Agriculture and Natural Resources, Fisheries and Livestock.

There was a Planning Group formed by the Director General of NBS and Chief Government Statistician consisted of staff from the Department of Economic Statistics of OCGS, Department of Agriculture Statistics of NBS, , Department of Agriculture of the Ministry of Agriculture and Natural Resources, and Ministry of Livestock and Fisheries. Other members came from the Department of Policy and Planning of the Ministry of Agriculture, Food Security and Cooperatives, Department of Policy and Planning of Ministry of Livestock and Fisheries in Tanzania Mainland.. The Planning Group was responsible for all Census operations.

Implementation of census activities at the regional level was overseen by the Regional Statistical Managers of OCGS and the Regional Agriculture Development Officer (RADO) from Ministry of Agriculture and Natural Resources.. At the District level the Census activities were managed by District Agricultural Officer (DADOs). Local Government Officers were fully In addition, there was a national mobile team to supervise census operations.

The Census and Surveys Technical Working Group (CSTWG) under MKUKUTA provided support in sourcing financing, approving budget allocations and monitoring the progress of the Census

A Technical Committee for the census was established with members from key stakeholder organisation and its function was to approve the proposed instruments and procedures developed by the Planning Group. It also approved the tabulations and analytical reports prepared from the Census data.

### 2.4.2 Tabulation Plan Preparation

The tabulation plan was developed considering the tabulations from previous census and surveys to allow trend analysis and comparisons as well as the needs of end users.

**Table 2.1 Census Sample Size**

<b>Description</b>	<b>Number</b>
Households	4,755
Villages/EAs	317
Districts	9
Regions	5

### 2.4.3 Sample Design

The Mainland sample consisted of 317 rural enumeration areas spread over nine districts. These EAs were drawn from the National Master Sample (NMS) developed to serve as a national framework for the conduct of household based surveys in the country. The National Master Sample was developed from the 2002 Population and Housing Census. The total agricultural households 4,755 were covered. Nationwide, all regions and districts were sampled except for Urban district.

A two stage sample was used, the numbers of villages/Enumeration Areas (EAs) were selected for the first stage with a probability proportional to the number of villages/EAs in each district. In the second stage, 15 households were selected from a list of agriculture households in each Village/EA using systematic random sampling. Table 2.1 gives the sample size of households, villages/EAs and districts.

### 2.4.4 Questionnaire Design and Other Census Instruments

The questionnaires were designed following user meetings to ensure that the questions asked were in line with users data needs. Several features were incorporated into the design of the questionnaires to increase the accuracy of the data:

- Where feasible all variables were extensively coded to reduce post enumeration coding error

- The definitions for each section were printed on the opposite page so that the enumerator could easily refer to the instructions whilst interviewing the respondent
- The responses to all questions were placed in boxes printed on the questionnaire, with one box per character.
- This feature made it possible to use scanning and Intelligent Character Recognition (ICR) technologies for data capture.
- Skip patterns were used to reduce unnecessary and incorrect coding of sections which do not apply to the respondent Each section was clearly numbered, which facilitated the use of skip patterns and provided a reference for data type coding for the programming of CSpro and SPSS.

Three other instruments were used:

- Village Listing Forms were used for listing households in the village/EA and from this list a systematic random sampling of 15 agricultural households were selected.
- A Training Manual which was used by the trainers for the cascade/pyramid training of supervisors and enumerators

Enumerator Instruction Manual which was used as reference material.

#### **2.4.5 Field Pilot-testing**

The Questionnaire was pilot-tested in four different locations both in Unguja and Pemba. The villages of Matemwe and Machui for Unguja and Kangagani and Chanjamjawiri in Pemba. The villages were selected due to the geographical nature so that they can represent the other parts of Zanzibar, the areas were coral and plantain. In addition, several data collection methodologies had to be finalized, namely, livestock numbers, mixed cropping, and finalizing skip patterns and documenting consistency checks.

#### **2.4.6 Training of Trainers, Supervisors and Enumerators**

During training, cascade/pyramid training techniques were employed to maintain statistical standards. The top level of training was provided to 13 national and regional supervisors who attended the National training of trainers' course in Morogoro organized by NBS. The idea was to have a uniformity of training on the modality of filling in questionnaire between Mainland and Zanzibar.

The trainers were members of the Planning Group from the Office of the Chief Government Statistician (OCGS), Ministry of Agriculture and Natural Resources and Ministry of Fisheries and Livestock, National Bureau of Statistics (NBS) and other sectoral Ministries in Mainland... The training concentrated on questionnaires, listing forms, field level Census methodology, and definitions. Emphasis was placed on consistency checking in the field. Tests were given to the supervisors and enumerators and the best 50 percent of the trainees were selected for the enumeration of the smallholder questionnaire and the community level questionnaire.

#### **2.4.7 Information, Education and Communication (IEC) Campaign**

Radios, televisions, newspapers, leaflets, t-shirts and caps were used to create awareness among the public on the Agriculture Sample Census. This helped in sensitizing the public on field level activities in order to increase the response rate. The t-shirts and caps were given to the field staff and village leaders. The village leaders assisted in locating the selected households.

#### **2.4.8 Data Collection**

Data collection activities for the 2007/08 Agriculture Sample Census started on 1<sup>st</sup> June, August 2009 and lasted for three weeks. The interview method was used to collect data during the census. Data collection was monitored by a hierarchical system of supervisors which included the Mobile Response Team, Regional and District Supervisors. The Mobile Response Team, which was headed by the Project coordinator provided overall direction to the field operations and responded to queries arising outside the scope of the training exercise. Decisions made on definitions and procedures were then communicated back to all enumerators via the Regional and District Supervisors.

District supervision and enumeration were performed by staff from the Ministry of Agriculture and Natural Resources and Ministry of Livestock and Fisheries. Supervision was provided by senior officers of the same Ministries and the Office of the Chief Government Statistician.

During the household listing exercise,. a total of 177 enumerators participated during the listing exercise and enumeration of small holder questionnaire.. Additional five percent of enumerators were kept as reserve in case of drop outs during the enumeration exercise.

#### **2.4.9 Field Supervision and Consistency Checks**

Enumerators were trained to probe the respondents until they were satisfied with the response given before they recorded them in the questionnaire. The first check of the questionnaire was carried out by enumerators in the field during enumeration, followed by district, Regional and National Supervisors. Supervisory visits at all levels of supervision focused on checking on the completeness of the questionnaires and consistency. Inconsistencies encountered were corrected, and where necessary a call back to the respondent was made by the enumerator to obtain the correct information. Further quality control checks were made by supervisors in the district.

#### **2.4.10 Data processing and analysis**

Data processing involved the following processes:

- Data entry
- Data structure formatting
- Batch validation
- Tabulation

#### **2.4.11 Data entry**

Scanning and ICR data capture technology was used. This did not only increase the speed of data entry but it also increased the accuracy of the data due to the reduction of keystroke errors. Interactive validation routines were incorporated into the ICR software to trap errors during the verification process.

Prior to scanning, all questionnaires underwent a manual cleaning exercise by checking that the questionnaire had a full set of pages, correct identification and good handwriting. A score was given to each questionnaire based on the legibility and the completeness of enumeration. This score

was used to assess the quality of enumeration and supervision. CSPro was used for data entry of questionnaires that were rejected by ICR extraction application.

CSPro was used for data entry of all Large Scale Farm and community based questionnaires due to the relatively small number of questionnaires. It was also used to enter smallholder questionnaires that were rejected by the ICR extraction application as well as those found unsuitable for scanning during the manual editing exercise.

#### **2.4.12 Batch validation**

A batch validation program was developed in CSPro in order to identify inconsistencies within a questionnaire. This is in addition to the interactive validation during the ICR extraction process. The procedures varied from simple range checking within each variable to more complexes checking between variables. In totality it took 6 months to screen, edit and validate the data from the smallholder questionnaire. After the long process of data cleaning, the tabulations were prepared based on a pre-designed tabulation plan.

#### **2.4.13 Tabulations**

Statistical Package for Social Sciences (SPSS) was used to produce the Census tabulations and Microsoft Excel was used to organize the tables and compute additional indicators. Excel was also used to produce charts while GIS was used for the maps.

#### **2.4.14 Analysis and Report Preparation**

The report writing was outsourced to Sokoine University of Agriculture. The analysis in the reports focuses on regional comparisons, time series and national production estimates. Microsoft Excel was used to produce charts; GIS and Excel were used to generate maps, whereas Microsoft Word was used to compile and write the report.

#### **2.4.15 Data Quality Control**

A great deal of emphasis was placed on data quality throughout the whole exercise from planning, questionnaire design, training, supervision, data entry, validation and cleaning/editing. As a result of this it is believed that the census is highly accurate and representative of what was experienced at field level during the Census year. With very few exceptions, the variables in the questionnaire are

within the norms for Zanzibar and they follow expected time series trends when compared to historical data.

## **2.5 Funding Arrangements**

The Agricultural Sample Census was supported mainly by the Department for International Development (DFID) and Japan International Cooperation Agency (JICA) who financed most of the operational activities. Other funds for operational activities came from the Government of Tanzania. In addition, technical assistance was provided by the Food and Agriculture Organisation (FAO).

### 3. CROP RESULTS

The results presented in this report is a summary on land use patterns, households engaged in crop production, the types of crops grown and the farming systems and crop husbandry practices in general. Crop production is conducted in both during the short and long rainy seasons. However, the long rainy season is the dominant crop production season during which 100,980 households (83% of the total households) were engaged in crop production compared to 41,520 households (34%) during the short rainy season. Generally, even though the area under cultivation had decreased, the number of households engaged in crop production during the 2007/08 season were higher (130,353) compared with 96,522 households recorded in 2002/03 period (Table 3.1).

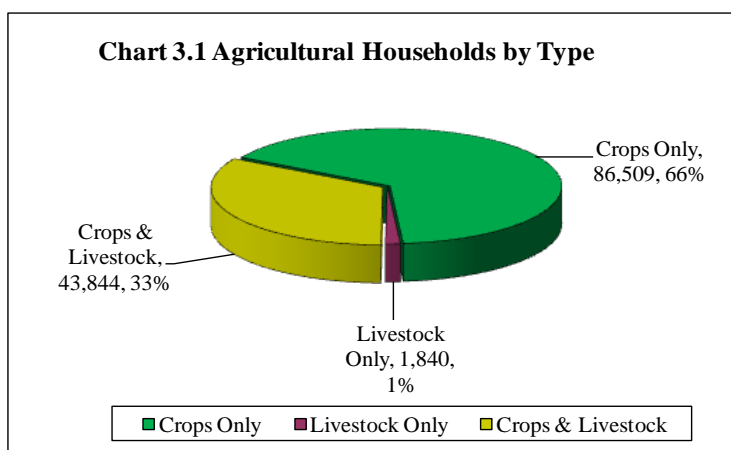

**Table 3.1: Number and Percentage of Crop Growing Households in Long and Short Rainy Season by District 2007/08**

District	Short Rainy Season			Long Rainy Season			Total Crop Growing Households	Total Planted Area (Hectare)
	Number of Household	Percentage	Planted Area (hectare)	Number of Household	Percentage	Area (hectare) Planted		
North 'A'	8,411	45	3,209	12,979	69	5,872	18,775	9,081.1
North 'B'	5,853	51	2,515	7,380	64	3,448	11,300	5,963.1
Central	7,417	54	6,262	13,670	100	6,505	13,588	12,767.1
South	4,192	64	2,388	6,580	100	1,137	6,547	3,525.5
West	5,840	31	1,734	7,944	43	2,825	1,7527	4,558.3
Wete	2,076	14	733	13,991	91	6,087	15,298	6,819.3
Mcheweni	4,818	27	1,327	13,549	77	5,263	17,374	6,589.8
Chakechake	1,039	8	336	11,169	81	5,152	13,804	5,488.1
Mkoani	1,874	12	624	13,709	85	5,506	16,146	6,129.2
<b>Total</b>	<b>41,520</b>	<b>34</b>	<b>19,127</b>	<b>100,980</b>	<b>83</b>	<b>41,795</b>	<b>130,353</b>	<b>60,921.5</b>

The total area planted during the short rainy season was 19,127 ha of which the Central district had the largest planted area (6,262 ha, 32.7%) and Chakechake district had the smallest (336 ha, 1.8%). In this season, other remaining districts, except Wete, and Mkoani, had intermediate planted areas in between the two extremes whereby North "A" had 3,209 ha (16.8%), North "B" had 2,515 ha (13.1%), South had 2,388 ha (12.5%), West had 1,734 ha (9.1%) and Micheweni had 1,327 ha (6.9%). There was a sharp increase in the number of households engaged in crop production during the long rainy season (Table 3.1) whereby Central, Wete, Micheweni and Mkoani districts each had slightly more than 13,000 households engaged in crop production with Central district having the largest planted area (6,505 ha, 15.6%) and South district having the smallest planted area (1,137 ha, 2.7%). Over the two seasons, a total of 142,500 households were engaged in crop production with most of the households in Central and South districts (Table 3.1). A total of 60,921.5 ha were planted with crops with Central district having the largest planted area (12,767 ha, 15.9%).

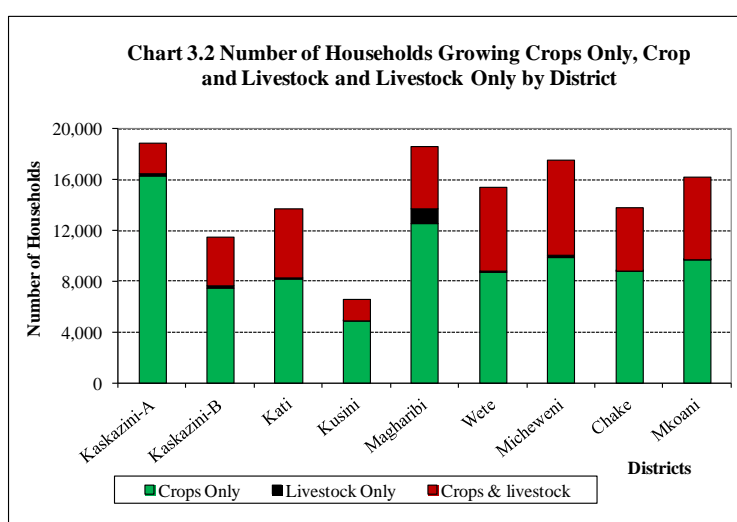

### 3.1 Type of Agricultural Households

Crop production was the dominant agricultural activity in Zanzibar engaging 86,509 households (66%) compared to 43,844 households (33%) that were engaged in mixed crops and livestock and 1,840 households (1%) that were engaged in livestock only. Unlike in the Mainland, none of the households in Zanzibar derived their livelihood from pastoralism (Chart 3.1, Map 3.1). Among the districts, south, North ‘A’ and West districts had the highest concentration of crop growing households per square kilometer while Central district had the lowest concentration (Map 3.2)

#### Crops Only

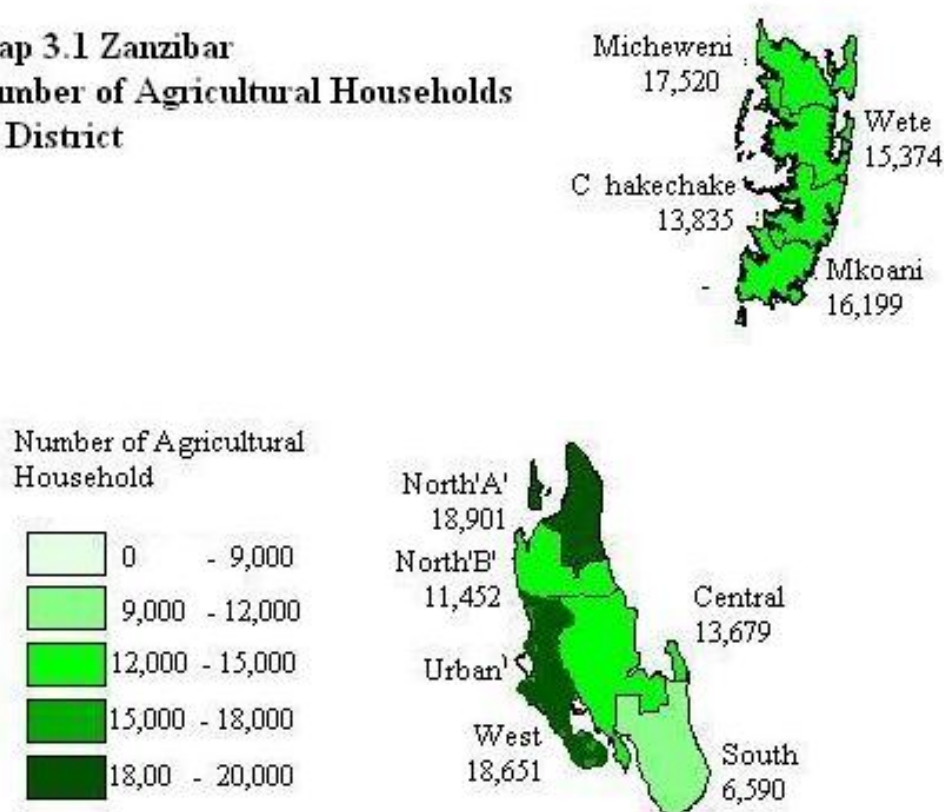

Crop farming was dominant with 86,509 households (65.4%) compared to 1,840 households (1.4%) which were engaged in livestock keeping alone (Chart 3.2, Maps 3.3 and 3.4). Amongst the districts, North-A had the largest number of households (16,318, 18.9%) engaged in crop production only followed by West district with 12,591 households (14.6%), Micheweni (9,899, 11.4%), Mkoani (9,675, 11.2%), Chakechake (10.2%), Wete (8,712, 10.1%), Central (8,177, 9.5%), North –B (7,457, 8.6%) and South district at the bottom with 4,890 households (5.7%).

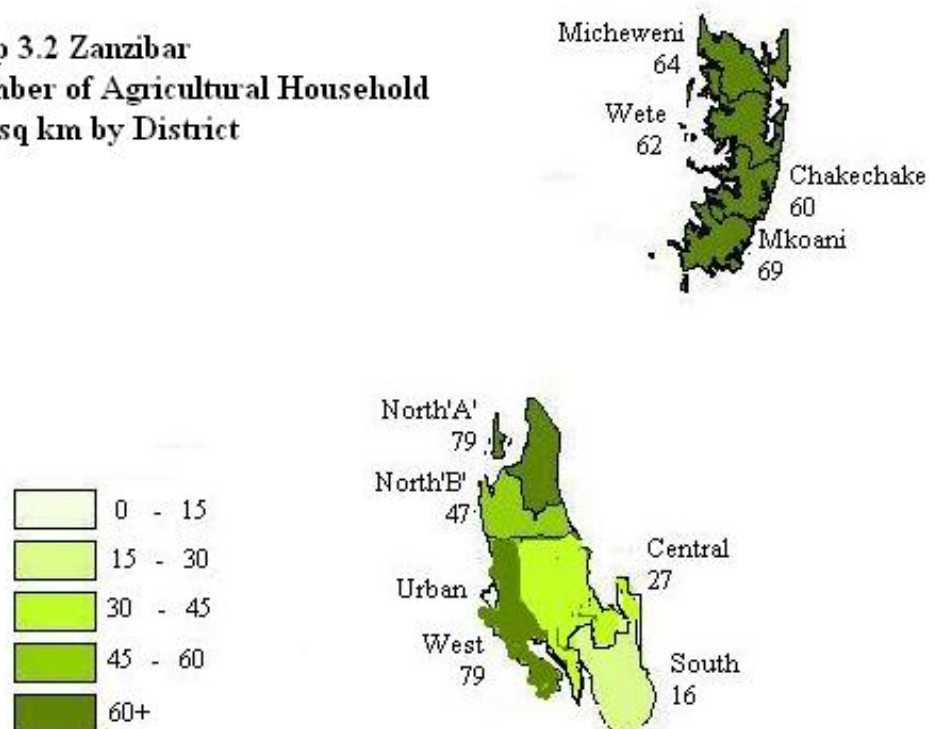

#### Crops and Livestock

West district stands out to have the largest number of households engaged in livestock keeping (1,130, 61.4%) while all other districts had fewer than 200 households (Chart 3.2). However, mixed crop production and livestock keeping was common in all the districts and Micheweni district had the highest number (7,475 households, 17%) and the lowest in South district (1,657 households, 3.8%).

**percentage Of Available Land**  
**by District**

### 3.2 Land Use

This section attempts to indicate to what extent land is available to households for agricultural activities particularly with regard to the use of the land for planting crops. A distinction is made between the land area planted which refers to the physical area of land planted with crops in any one particular year. In cases where the same piece of land is used for planting more than one crop, the area is summed up.

#### 3.2.1 Area of Land Utilized for Growing Crops

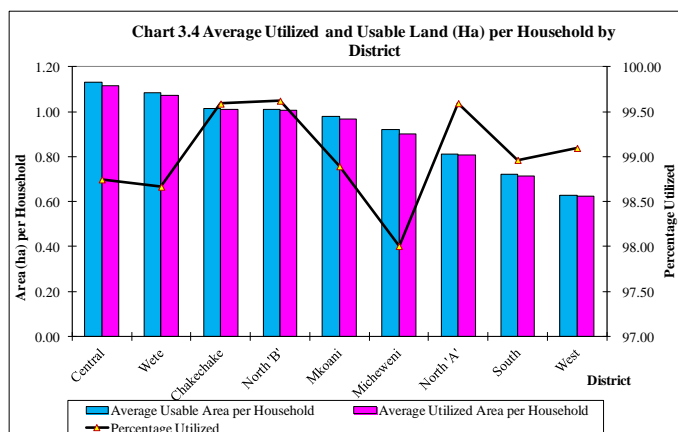

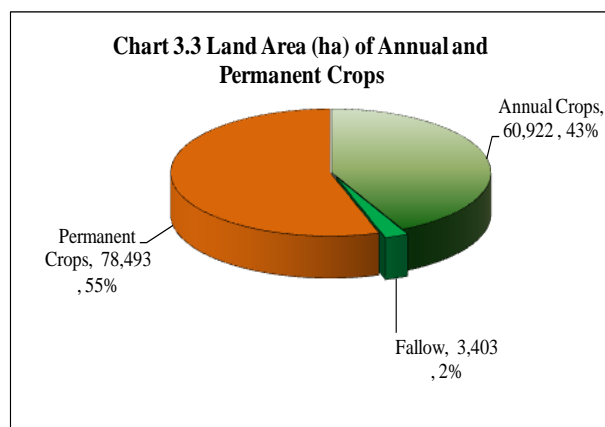

The total area of land available for the production of annual and perennial crops was 120,325 ha. In all the districts, the proportion of planted area is larger during the long rains than during the short rainy season. In both seasons, the Central district had the highest land utilization being 33% of the 6,262 planted area during the short rainy season and 16% of the 6,505 ha of the area planted during long rainy season (Table 3.2, Map 3.6 – percentages indicated on the map to be reconciled). On the other hand, West, Wete, Micheweni, Chakechake and Mkoani districts each had less than 10% land utilization, Chakechake being the lowest at 6.1%, during the short rainy season and South district at 3% during the long rainy season.

Generally, land utilization was relatively higher during the long rainy season than during the short rainy season except in North “B”, South and West districts. Land available for crop production is variable across the districts. Land area for crop production was largest in Central district (1.74 ha/household) and smallest in West district at 0.72 ha/household and only three districts (North “B”, Central and Wete) which were above the overall average of 1.15 ha. Land for crop production per household in the other districts were as follows: North “B” (1.19 ha), Wete (1.18 ha), South (1.04), Mkoani (1.03 ha), Chakechake (1.02 ha), Micheweni (0.92 ha) and North “A” (0.88 ha).

**Table 3.2: Total Area Used for Annual and Permanent Crops and Average Area per Household by District**

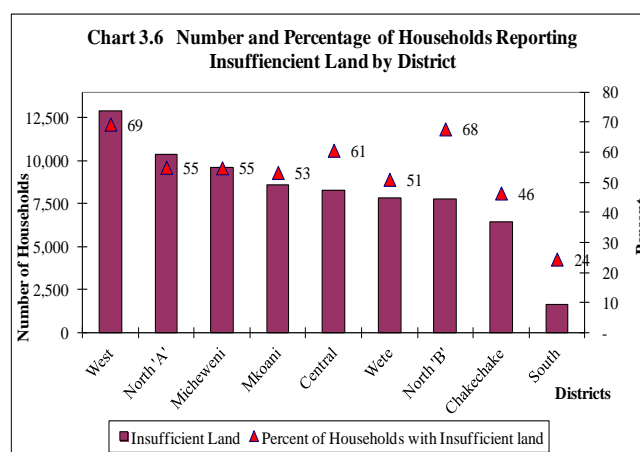

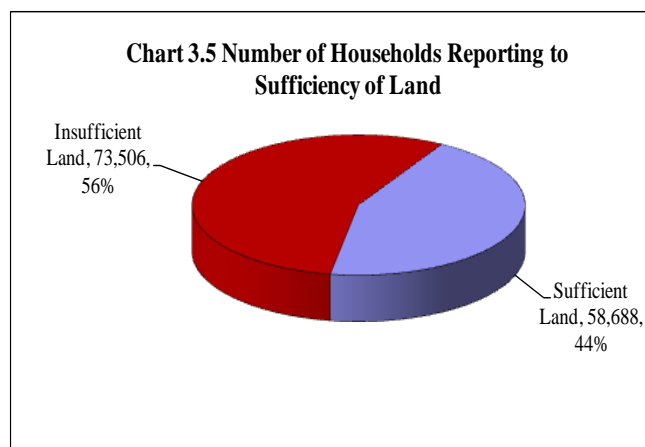

District	Planted area (ha)						Total		
	Planted area (hectare) in Short rainy season	Percentage	Planted Area (hectare) in Long rainy season	Percentage	Permanent crops	Percentage	Total Used Annual and Permanent	Area for growing Households	Average Area (hectare) per household
North ‘A’	3,209	17	5,872	14	7,492	10	16,573	18,775	0.88
North ‘B’	2,515	13	3,448	8	7,610	10	13,574	11,300	1.19
Central	6,262	33	6,505	16	11,033	14	23,800	13,588	1.74
South	2,388	12	1,137	3	3,299	4	6,825	6,547	1.04
West	1,734	9	2,825	7	8,919	11	13,477	17,521	0.72
Wete	733	4	6,087	15	11,311	14	18,130	15,298	1.18
Micheweni	1,327	7	5,263	13	9,559	12	16,149	17,374	0.92
Chakechake	336	2	5,152	12	8,667	11	14,155	13,804	1.02
Mkoani	624	3	5,506	13	10,604	14	16,733	16,146	1.03
<b>Total</b>	<b>19,127</b>	<b>100</b>	<b>41,795</b>	<b>100</b>	<b>78,493</b>	<b>100</b>	<b>139,415</b>	<b>130,353</b>	<b>1.15</b>

Compared to agriculture census (2002/03), the total area planted with annual crops has declined from 78,274 ha to 60,922 ha while the area under permanent crops has increased to 78,493 ha as compared to 32,120 ha in 2002/03 (Charts 3.3 and 3.4). Generally, however, a larger proportion of the land was planted with permanent crops (78,493 ha, 60%) as compared to annual crops (52,457, 40%) and most of the land available was utilized for crop production and land kept under fallow being 3,402 ha (2%).

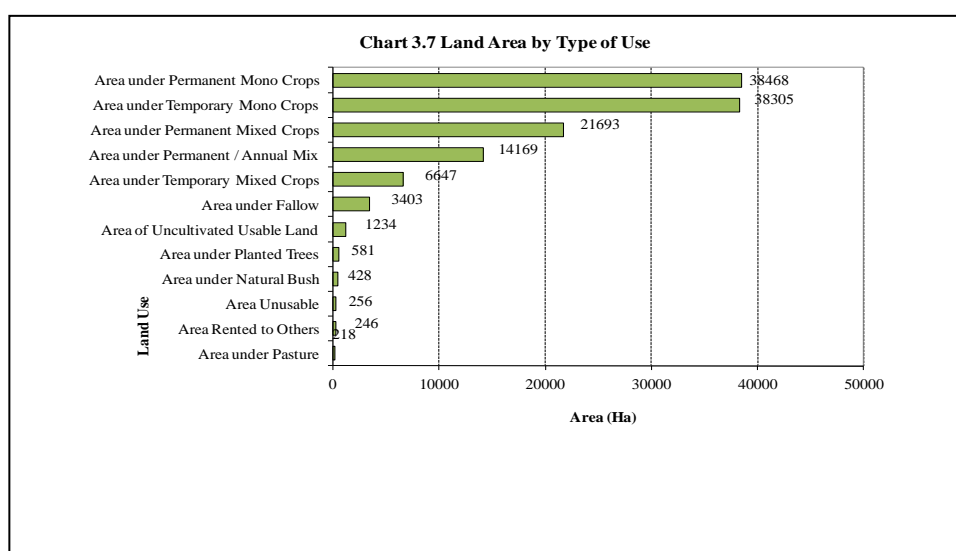

### 3.2.2 Land Use Sufficiency

Land is under pressure for a greater part of the population as 56% of the households (73,506) reported land insufficiency as compared to 58,688 households (44%) which reported having sufficient land (Charts 3.5 and 3.6). The high proportions of households reporting land insufficiency is consistent with the low average land available (1.5 ha) per household. Pressure on land was further depicted by the fact that the usable land (121,556 ha) was utilized almost entirely (121,325 ha, 98.99%), with a range of between 99% (Micheweni district) and 99.59% (North "A").

### 3.2.3 Land Use Patterns

The land use patterns as presented indicate a general increase in the land available for crop production from 111,278 ha (2002/03 Agricultural Census) to the current 132,193 ha. The land available is divided between 38,305 ha (29%) for the production of temporary (annual) crops grown in monoculture and 38,468 ha (29.1%) for permanent (perennial) crops in monoculture (Chart 3.7) and other relatively less dominant land uses: permanent mixed crops (21,693 ha, 16.4%), mixed permanent and annual crops (14,169 ha, 10.7%), mixed temporary crops (6,647 ha, 5%) and fallow (3,403 ha, 2.7%).

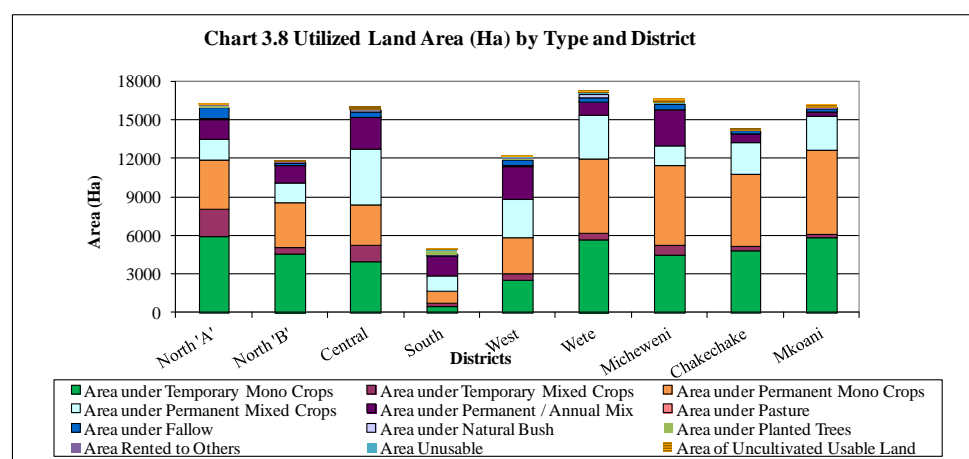

Much smaller areas were under planted trees, pasture, natural

bush, unusable and/or rented to others which together amounts to 2,962 ha (7%). This implies that temporal and permanent mono crop production were the two most common land use types.

The land area planted with temporary (annual) mono crops (38,305 ha) was comparable with that planted with perennial monocrops (38,468 ha). However, the 38,305 ha under annual monocrops represent a significant decline from the 65,008 ha recorded during the 2002/03 agricultural census.

Amongst the districts, North "A" had the largest area under annual mono crops (5,977 ha, 15.6%) and South district had the smallest (468 ha, 1.2 ha). All other districts were in between the two extremes (Chart 3.8, Table 3.3).

Temporary mixed crops were planted on a relatively smaller area (6,647 ha) of which North “A” district had the single largest component (2,117 ha, 31.8%) followed by Central district (1,269 ha, 19.1%) and Micheweni (794 ha, 11.9%). All other districts had smaller areas which collectively accounted for 37.2% of the land.

**Table 3.3: Land Use Pattern**

District	Area under Temporary mono crops	Area under temporary /mixed crops	Area under permanent mono crops	Area under permanent mixed crops	Area under permanent/ annual mix	Area under pasture	Area under fallow	Area under planted trees
North ‘A’	5,977	2,117	3,788	1,679	1,515	77	876	89
North ‘B’	4,536	525	3,537	1,554	1,298	5	172	46
Central	4,004	1,269	3,113	4,341	2,509	15	412	4
South	468	249	973	1,189	1,493	12	121	323
West	2,524	544	2,822	2,928	2,598	44	472	32
Wete	5,715	497	5,762	3,446	971	29	380	44
Micheweni	4,472	794	6,222	1,4888	2,815	0	446	24
Chakechake	4,794	365	5,666	2,485	614	25	229	19
Mkoani	5,815	297	6,584	2,582	357	11	294	0
Total	38,305	6,647	38,468	21,693	14,169	218	3,403	581

The area under permanent mono crops (38,468 ha), and permanent mixed crops (21,693 ha) together accounted for 48.7% of the utilized land area (123,484 ha). In the case of permanent mono crops, the largest planted area was in Mkoani district (6,584 ha, 17.1%) while South district had the smallest (973 ha, 2.5%). In the case of permanent mixed crops (Chart 3.8 and Table 3.3), the distribution of area planted, in descending order, was Central (20%), Wete (15.9%), Mkoani (11.9%), Chakechake (11.5%), North “A” (7.7%), North “B” (7.2%), Micheweni (6.9%) and South district (5.5%).

Permanent mixed with annual crops occupied a total 14,169 ha with Micheweni district accounting for 19.9%, West 18.3%, and Central 17.7%. North “A” and “B” and South districts had areas planted with permanent mixed crops in the range between 10.5 and 10.7% while the remaining districts Wete, Chakechake and Mkoani had between 2.5 and 6.5% (Chart 3.8). The remaining planted area, across districts, is divided between planted trees (0.47%), fallow (2.8%) and pasture (0.18%). However, Micheweni did not have land area planted to pasture and Mkoani had no land with planted trees (Chart 3.8 and Table 3.3).

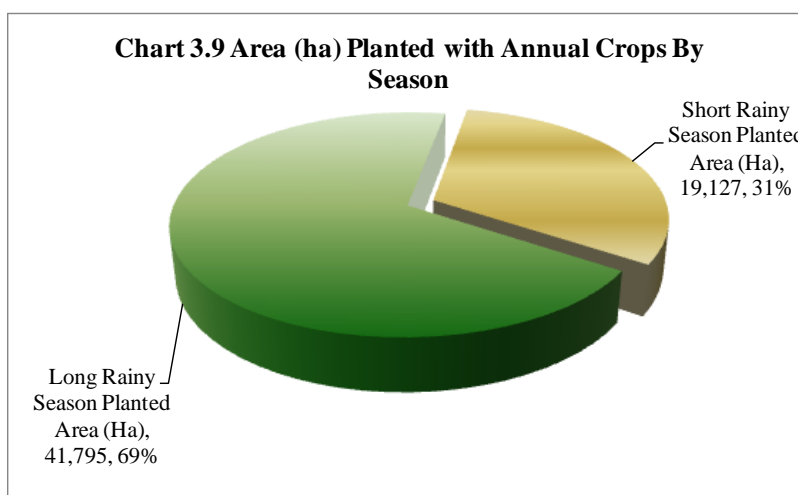

### 3.3 Annual Crop Production

Zanzibar has two seasons; the long rainy season which is the main season and the short rainy season. However, the land area used for the production of annual crops was larger in the long rainy season than during the short rainy season implying that the long rains are more reliable with an inference that most of the annual crop production is rain-fed.

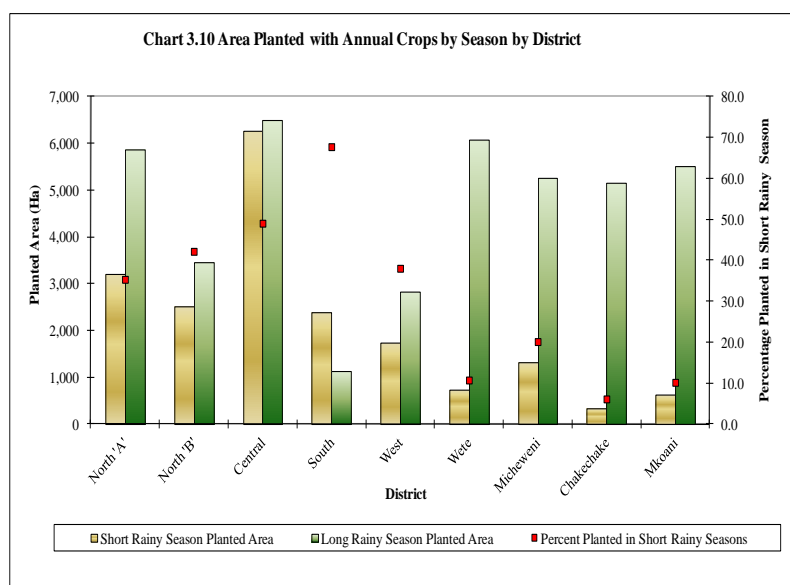

#### 3.3.1 Planted Area

During 2007/08, the total area planted with annual crops was 60,922 ha (Chart 3.9, Map 3.7) which was 22% less than the area planted to similar type of crops during 2002/03 (78,276 ha). This implies the probability that some of the area suitable for planting annual crops was converted to some other

uses. In the area planted during 2007/08, most of the annual crops were planted during the long rainy season (41,795 ha, 69%) as compared to the short rainy season (19,127 ha, 31%).

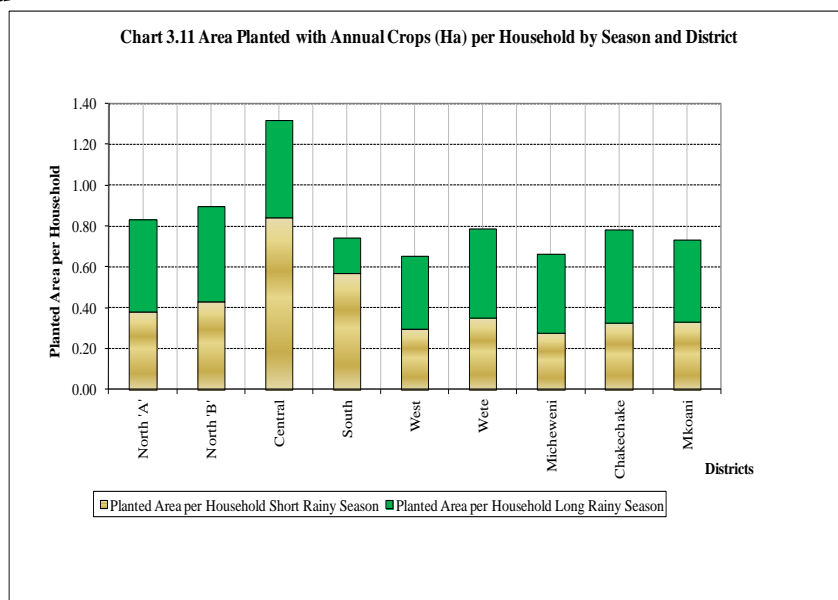

The trend of preference for long rainy season as the main planting season is illustrated by the relatively large area planted during the long rains in all the districts except South district. In Central district, the area planted during the short rainy season (6,262 ha) was almost equal to the area planted during the long rainy season (6,505 ha) and South district had the smallest planted area during the long rainy season (Chart 3.10, Maps 3.8 and Map 3.9). The total planted area for the two seasons was largest in Central district (12,767 ha) and smallest in South district (3,526 ha).

### Crop Area Planted per Household

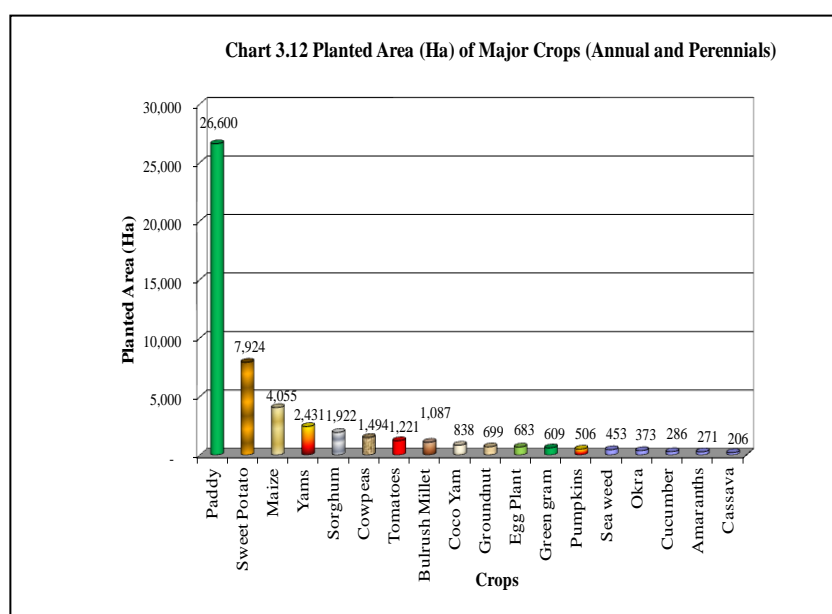

During the long rains, individual holdings were below 0.5 ha per household across all the districts with highest (0.48 ha/household) in Central district and lowest (0.17 ha/household) in South district. Comparatively, land areas planted per household were much smaller during the short rains except Central and South districts with 0.84 and 0.57 ha

/household, respectively. These were the only two districts with planted area larger than 0.5 ha per household. Considering both the total area planted (Chart 3.10) and the planted area per household (Chart 3.11), Central district was the key district for annual crop production in Zanzibar, followed by North “B” and North “A” and South districts.

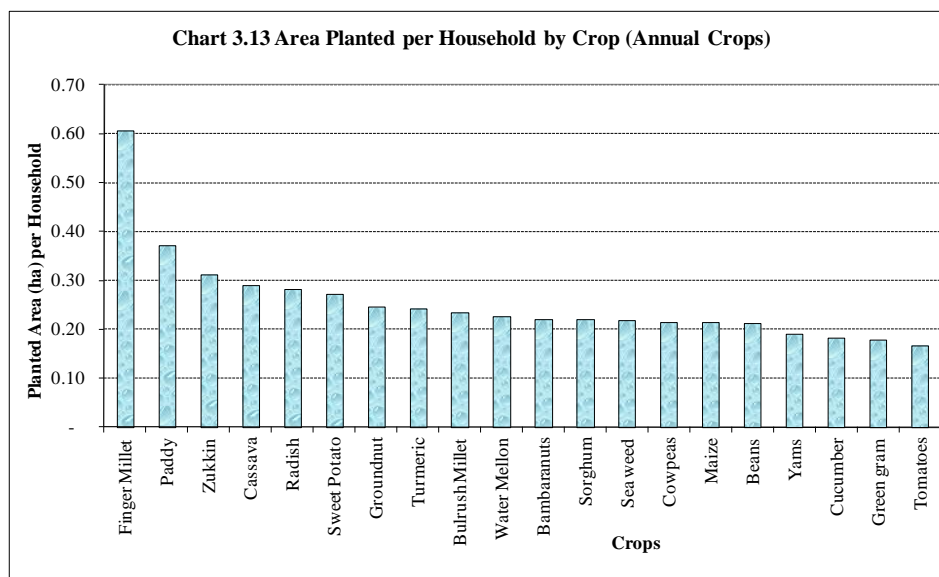

### 3.3.2 Crop Types

Amongst the annual (and some semi-perennial) crops, paddy was the single most important annual crop in Zanzibar (Chart 3.12) which was planted on 26,600 ha. This was a shift from the situation in 2002/03 where roots and tubers were the most important subsistence crops in Zanzibar (Agricultural Census 2002/03). Paddy was followed by a large margin difference, by sweet

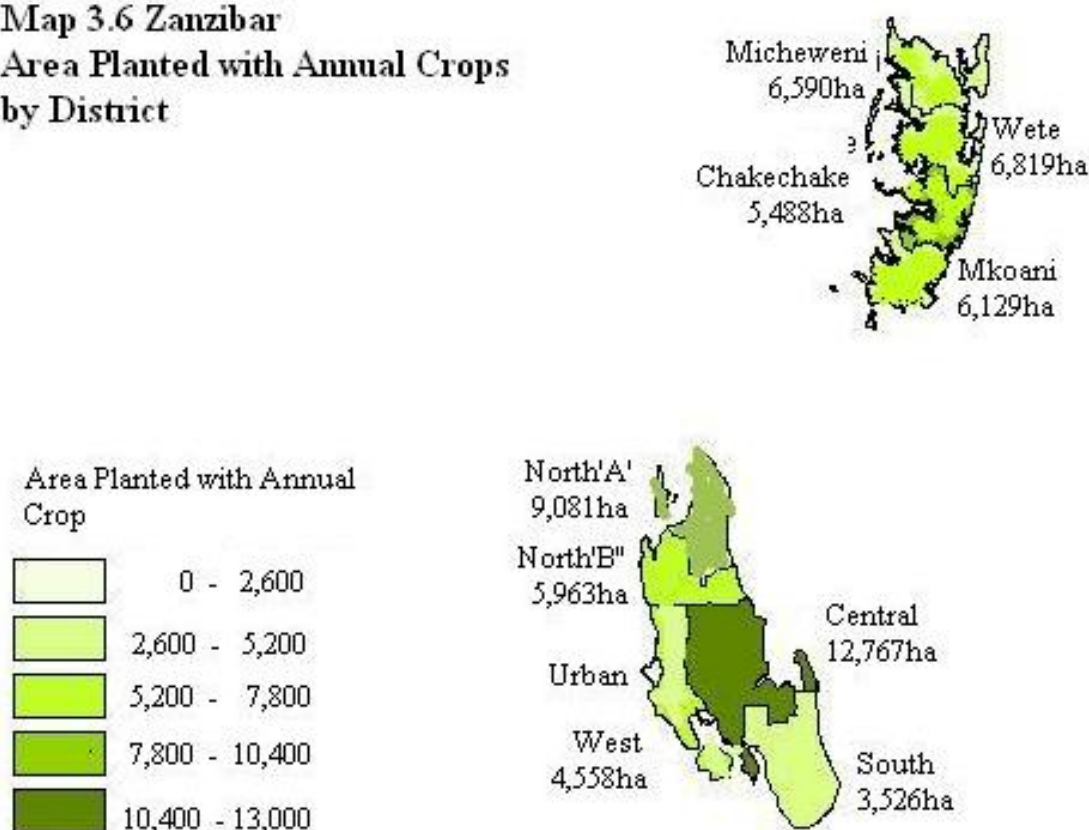

potatoes (7,924 ha), maize (4,055 ha) and yams (2,431 ha). A host of other annual and semi-perennial crops (coco yams) were planted on relatively much smaller areas of which sorghum, cowpeas, tomatoes and bulrush millet occupied at least 1000 ha each, (Chart 3.12).

In terms of land area occupied by different crops (Chart 3.13), areas planted with finger millet were the largest (0.61 ha per household) followed by paddy (0.37 ha per household), zucchini (0.31 ha per household), cassava (0.29 ha per household), radish (0.28 ha per household), sweet potatoes (0.27 ha per household) and groundnuts (0.25 ha per household).

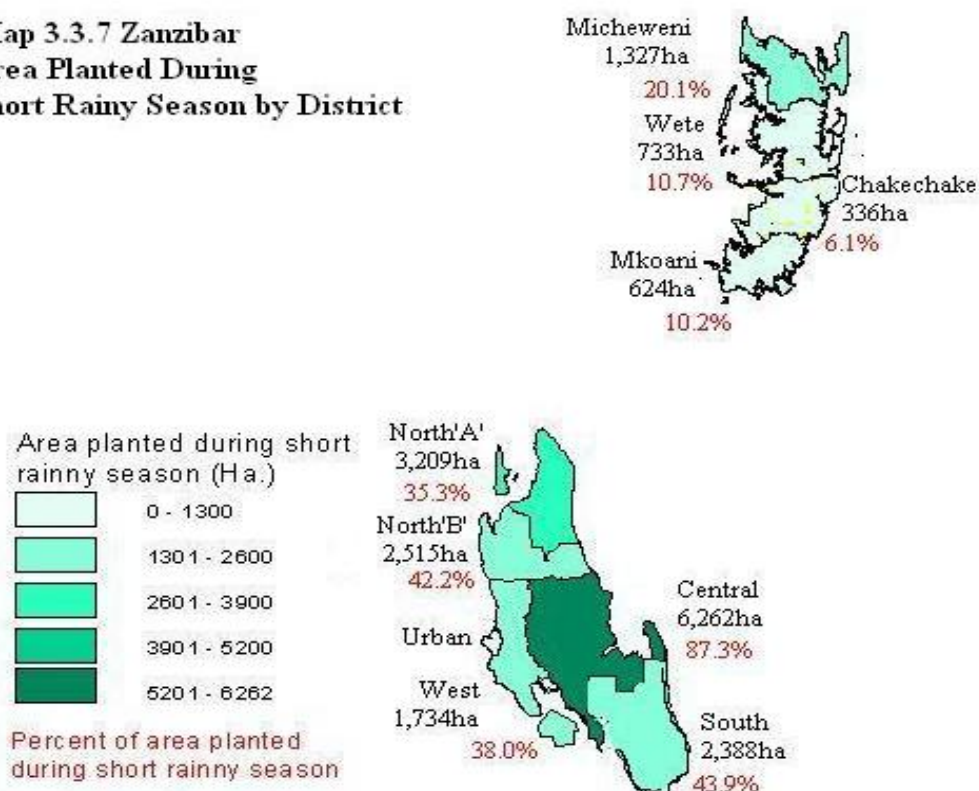

Zucchini and radish were the vegetable crops amongst the annual crops planted on relatively large areas indicating the relative importance of vegetable crops in Zanzibar.

### 3.3.3 Analysis of Important Crops

Results on the main crops have considered the relative importance of each of the crops under the grouping of annual crops and permanent or perennial crops (tree and non-tree types). Separate analyses for annual and permanent crops are provided in different sections.

### Relative Crop Importance

Generally, roots and tubers were the most dominant group of crops occupying 49,902 ha equivalent to 55 percent of the total planted area (Charts 3.14 and 3.15 and Map 3.10) followed by cereals (33,704 ha, 37%), fruits and vegetables (3,946 ha, 4%) and pulses (2,210 ha, 2%). At the bottom of the list were oilseeds such as sesame and oil nuts, mostly coconut, each with 1%. The data indicates that crop preference has remained the same as that of 2002/03 agricultural sample census.

**Table 3.4 Area Planted and Quantity Harvested by Season and Type of Cereal Crops**

Crop	Rainy Season	Actual Planted Area (ha)	Quantity Harvested (tons)	Yield (tons/ha)
Maize	Short Season	1,295	2,045	1.6
	Long Season	2,760	3,358	1.2
Paddy	Short Season	3,125	4,032	1.3
	Long Season	23,475	28,233	1.2
Sorghum	Short Season	414	270	0.7
	Long Season	1,508	1,429	0.9
Bulrush Millet	Short Season	871	721	0.8
	Long Season	215	119	0.6
Finger Millet	Short Season	0	0	0
	Long Season	18	13	0.7

### 3.3.4 Cereal Production

Amongst the cereals, paddy was planted on largest land area (26,600 ha) and produced the highest quantities in both the long and short rainy

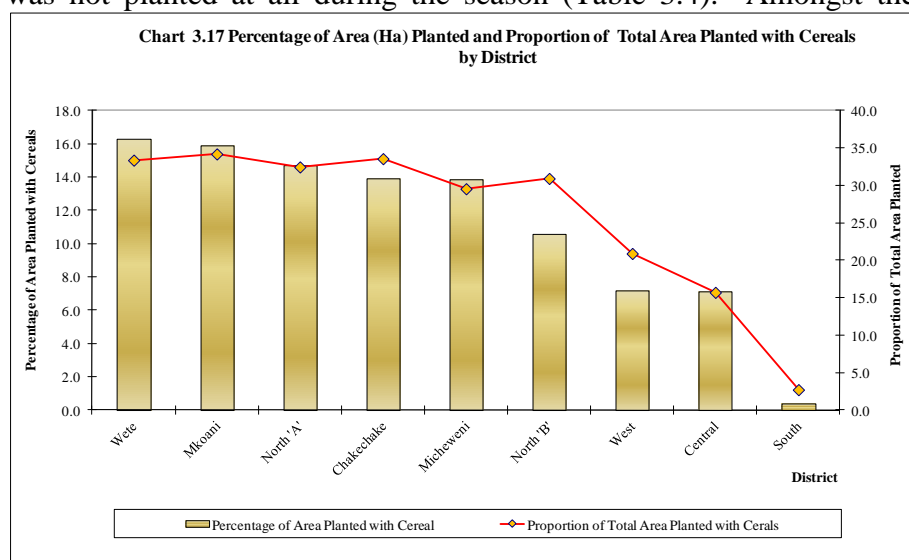

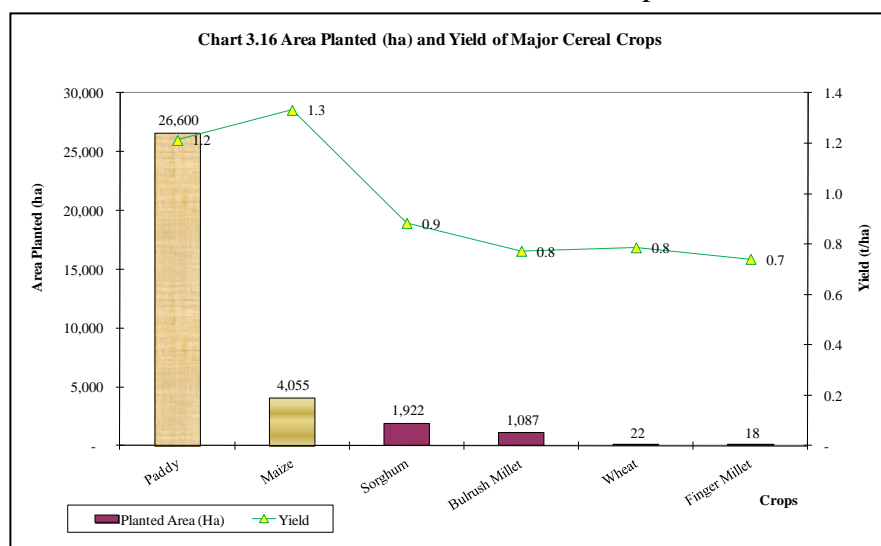

seasons (Table 3.4 and Chart 3.16). However, the long rainy season accounted for the greatest planted area (11.7%) of the planted area. A total of 3,125 ha was planted during the short rains. Maize, sorghum and bulrush millet were the second, third and fourth cereals planted on a total of

4,055, 1,922 and 1,087 ha, respectively (Chart 3.16).

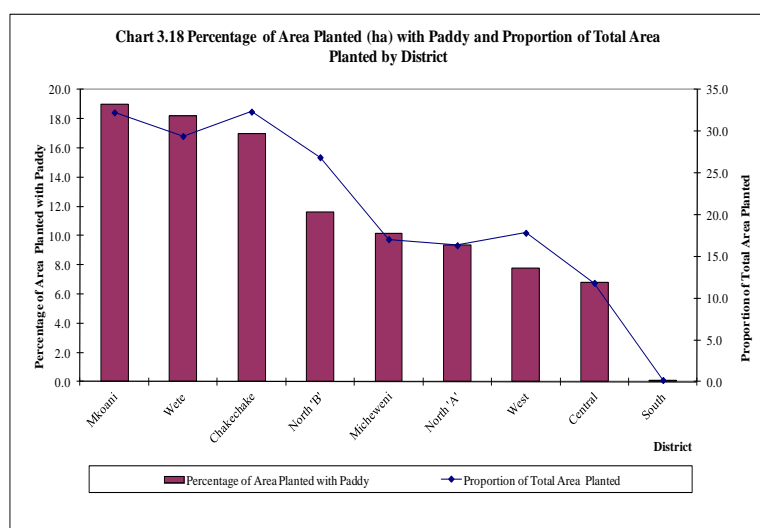

However, maize and sorghum were planted mostly during the long rainy season (68.1 and 78.5%, respectively) while bulrush millet was planted predominantly during the short rainy season (871 ha,

80.1%) while finger millet was not planted at all during the season (Table 3.4). Amongst the

cereals, wheat and finger millet occupied the smallest and almost negligible land areas (Chart 3.16). Generally, yields were highest for maize (1.3 tons/ha) followed by paddy (1.2 tons/ha). The yields of all other cereals were in the

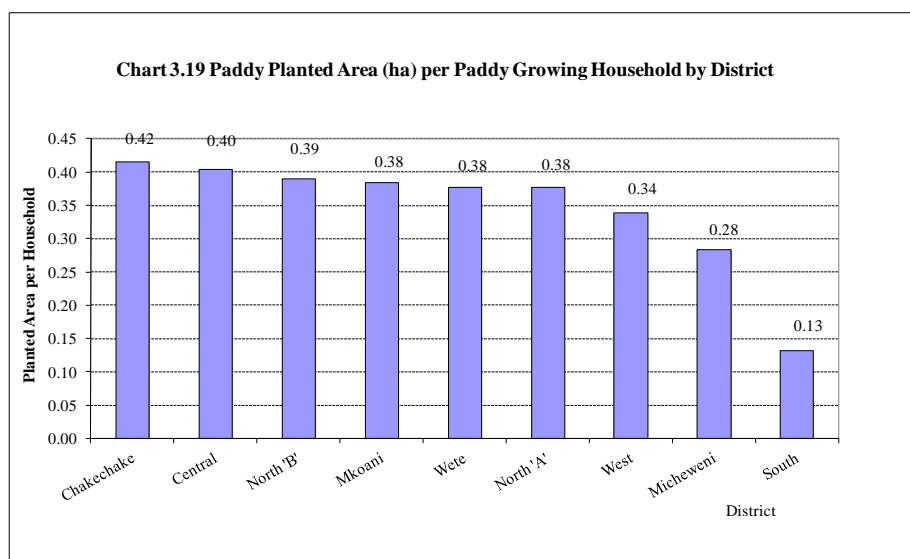

range between 0.7 and 0.9 tons/ha (Chart 3.16). Across the districts (Chart 3.17), the actual area planted with cereals was largest in Wete district (5,497 ha, 16.8% of total area under cereals) followed by Mkoani (5,360 ha, 15.9%), North 'A' (4,953 ha, 14.7%) and Chakechake (4,697 ha, 13.9%) of which Chakechake had the largest proportion of the district land are planted with cereals (33.6%). South district had the lowest planted area (128 ha, 0.4%) equivalent to 2.7% of the proportion of land planted with cereals.

## Paddy Production

Paddy production was undertaken in all the districts and the largest planted area was in Mkoani district (5,055 ha, 19%). Followed by Wete (18.2%), Chakechake (17%), North 'B' (11.6%) and Micheweni (10.1%). South district had the smallest planted area (9 ha, less than 0.1%), (Chart 3.18, Maps 3.13 and 3.14).

In Chakechake, Mkoani and Wete districts the number of households planted paddy together accounted for 51.5% of the total 71,633 paddy growing households (Table 3.5 and Chart 3.19). Amongst the three

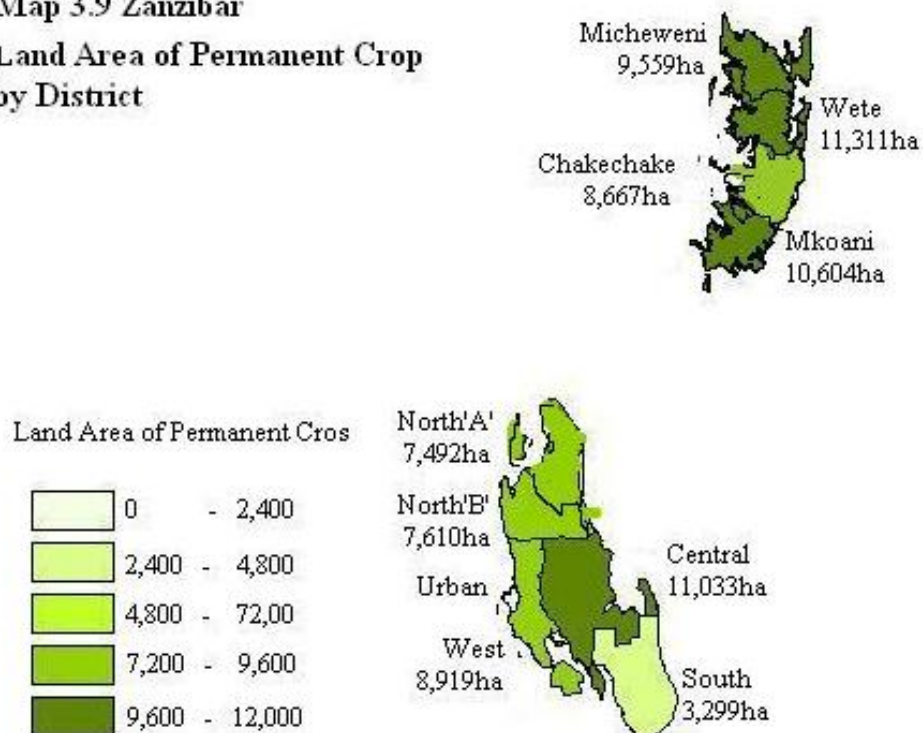

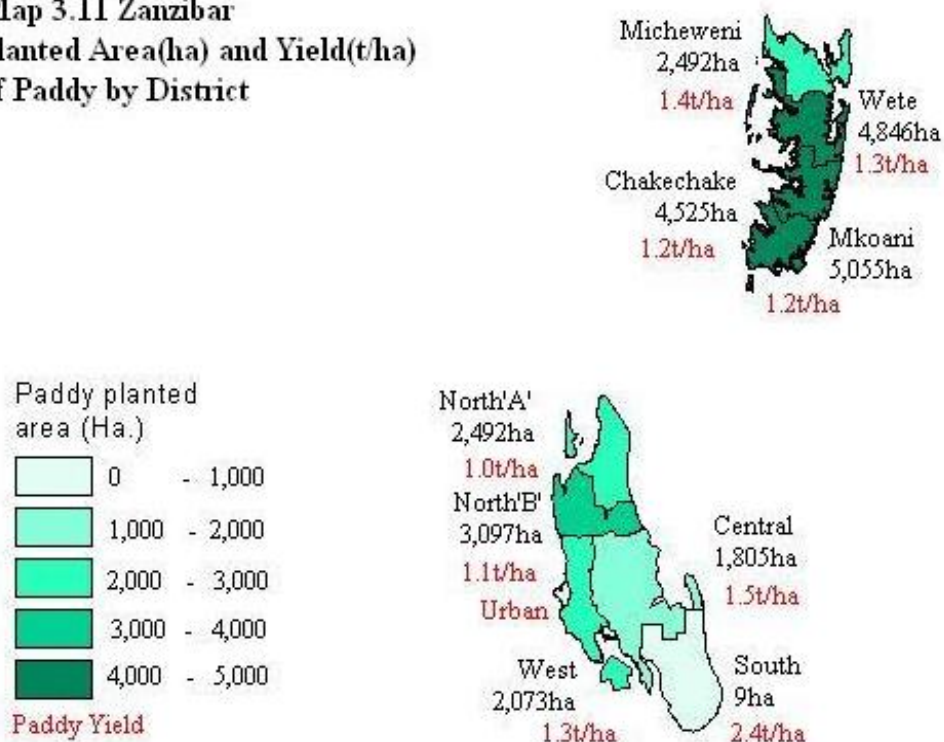

districts, Mkoani had the highest number of households (13,174, 18.4%), followed by Wete (12,838 households, 17.9%) and Chakechake (10,890 households, 15.2%). In the second tier were four districts which accounted for another 49.0% of the paddy growing households led by Micheweni (9,519 households), North 'B' (7,940 households), North 'A' (6,615 households) and West (6,123 households). Paddy was relatively less preferred in Central district (4,468 households) and smallest in South district

**Table 3.5 Planted Area per Household Growing Paddy, Short and Long Rainy Season by District**

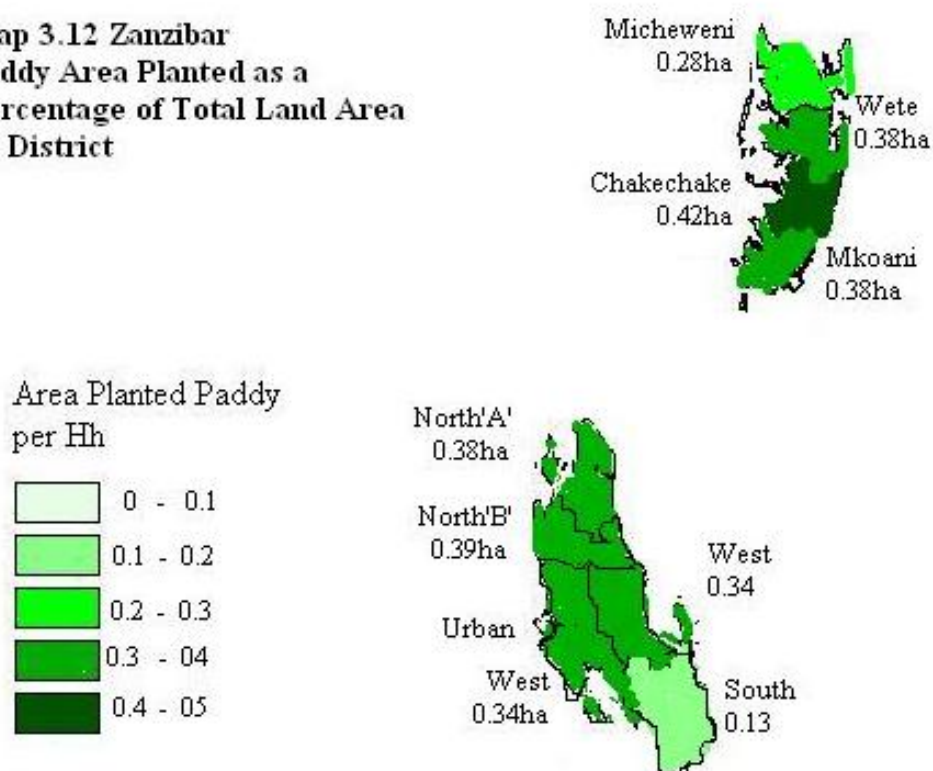

District	Number of Household	Actual Planted Area (ha) with Paddy	Planted Area per Household
Chakechake	10,890	4,525	0.42
Central	4,468	1,805	0.40
North 'B'	7,940	3,097	0.39
Mkoani	13,174	5,055	0.38
Wete	12,838	4,846	0.38
North 'A'	6,615	2,492	0.38
West	6,123	2,073	0.34
Micheweni	9,519	2,698	0.28
South	65	9	0.13
<b>Total</b>	<b>71633</b>	<b>26,600</b>	<b>0.37</b>

(65 households).

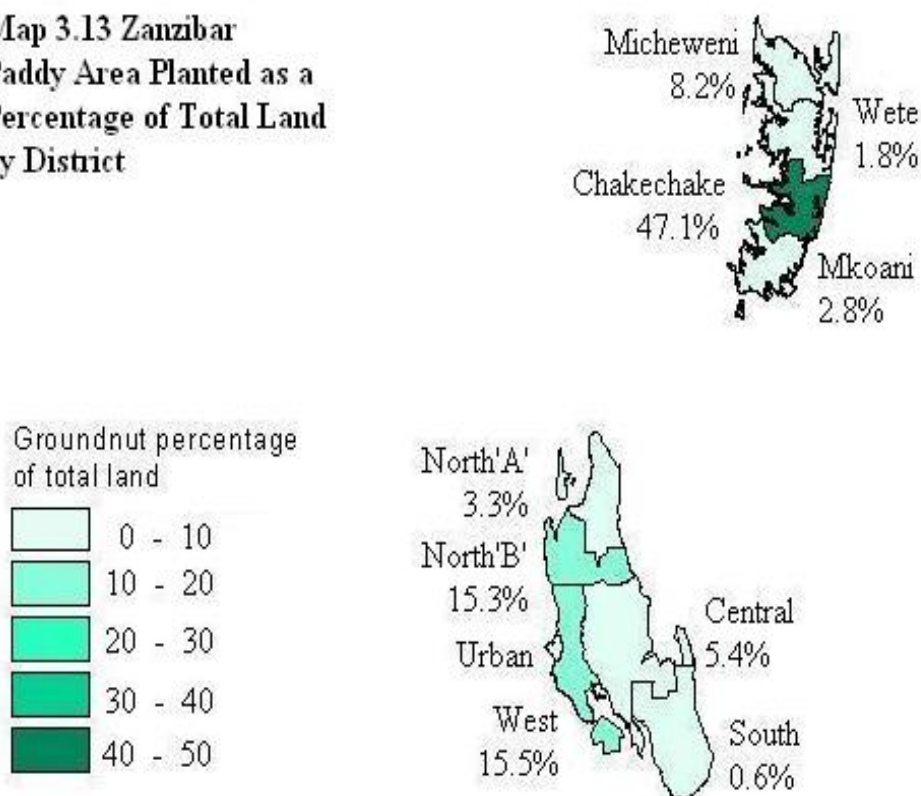

Despite the variation in the number of households growing paddy, individual household paddy fields were generally small, less than 0.5 ha in all the districts. Average planted area per household were generally comparable in most of the districts with Chakechake district being highest (0.42 ha/hh), followed by Central (0.40 ha/hh), North 'B' (0.39 ha/hh) and Mkoani, Wete and North 'A' districts each with an average of 0.38 ha per household (Chart 3.19, ). South district had the smallest planted area per household (0.13 ha). (Chart 3.19 and Table 3.5).

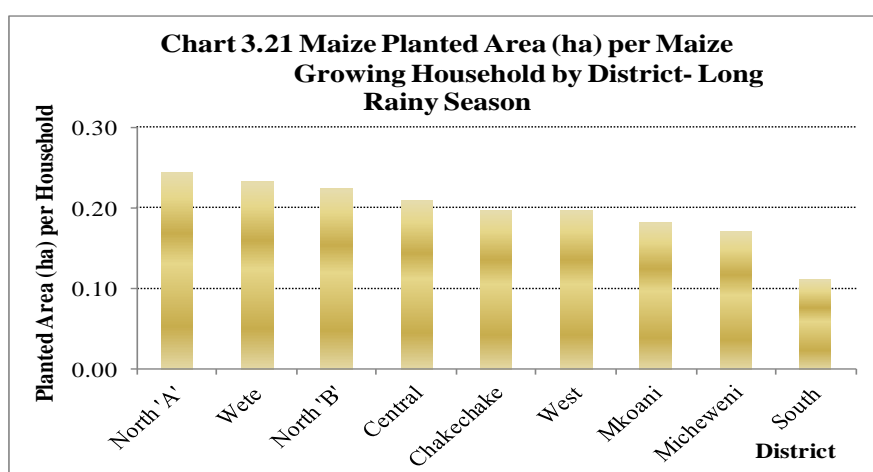

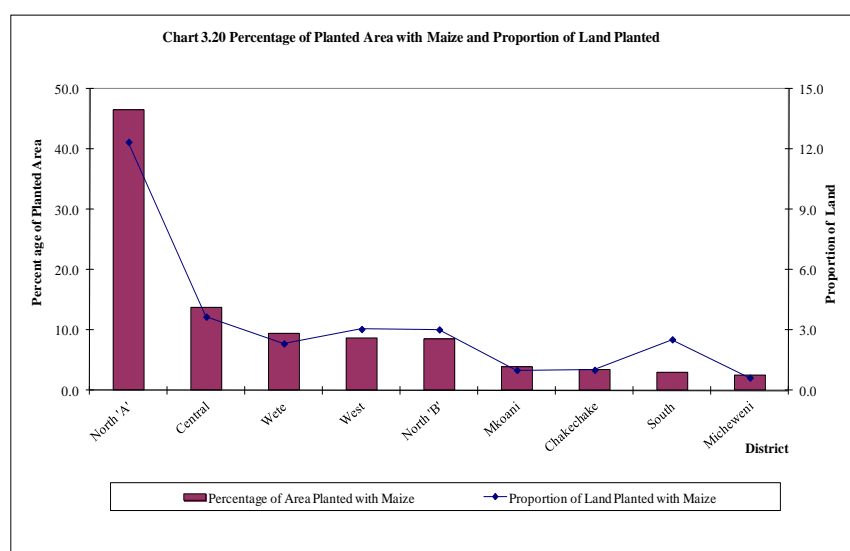

**Map 3.13 Zanzibar**  
**Paddy Area Planted as a**  
**Percentage of Total Land**  
**by District**

## Maize Production

During the short and long rainy seasons maize production which was carried out on 4,055 ha was the second most important cereal crop after paddy and was grown in all the districts. The crop occupied relatively smaller proportions of the total planted area compared to paddy in all the districts except

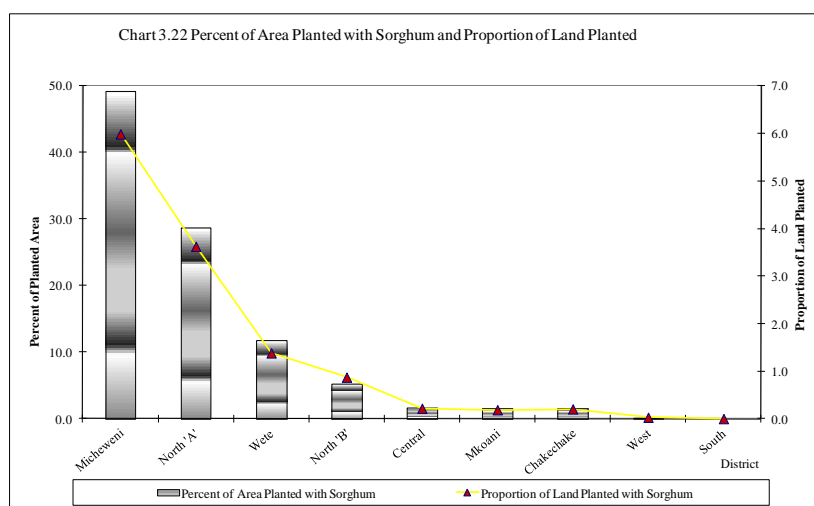

the South district. However, large variations existed as a major part of the area planted with maize (1,886 ha, 46.5%) was in only one district, North 'A' (Chart 3.20, Map 3.14). In other other districts, Central district was the second with 559 ha (13.8%). Other districts accounted for less than 10% of the planted area, the smallest being Micheweni district (2.5%). During the long rainy season the number of households which

planted maize was similarly highest in North 'A' district ( 6174 households, 49.8%), where individual holdings were also largest (0.24 ha/household) followed by Wete (1,435 households, 11.6%; 0.23 ha/household). The smallest planted area per household (0.11 ha/household, was found in South district (Chart 3.21 and Map 3.16).

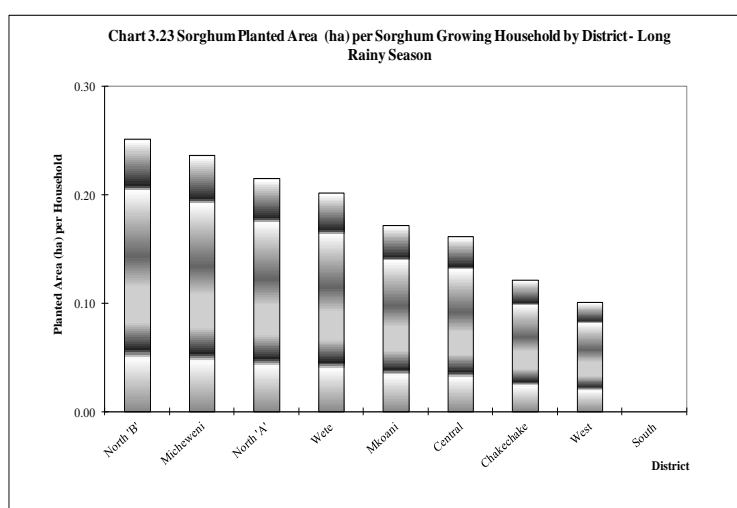

## Sorghum Production

The total land area planted with sorghum in the two seasons was 1,922 ha (1508 ha long rainy season and 414 ha short rainy season) of which 49.3% of the land (947 ha) was in Micheweni; 28.8% (553 ha) was in North 'A'; 11.9% (228 ha) was in Wete and 5.2% (100 ha) was in North 'B'

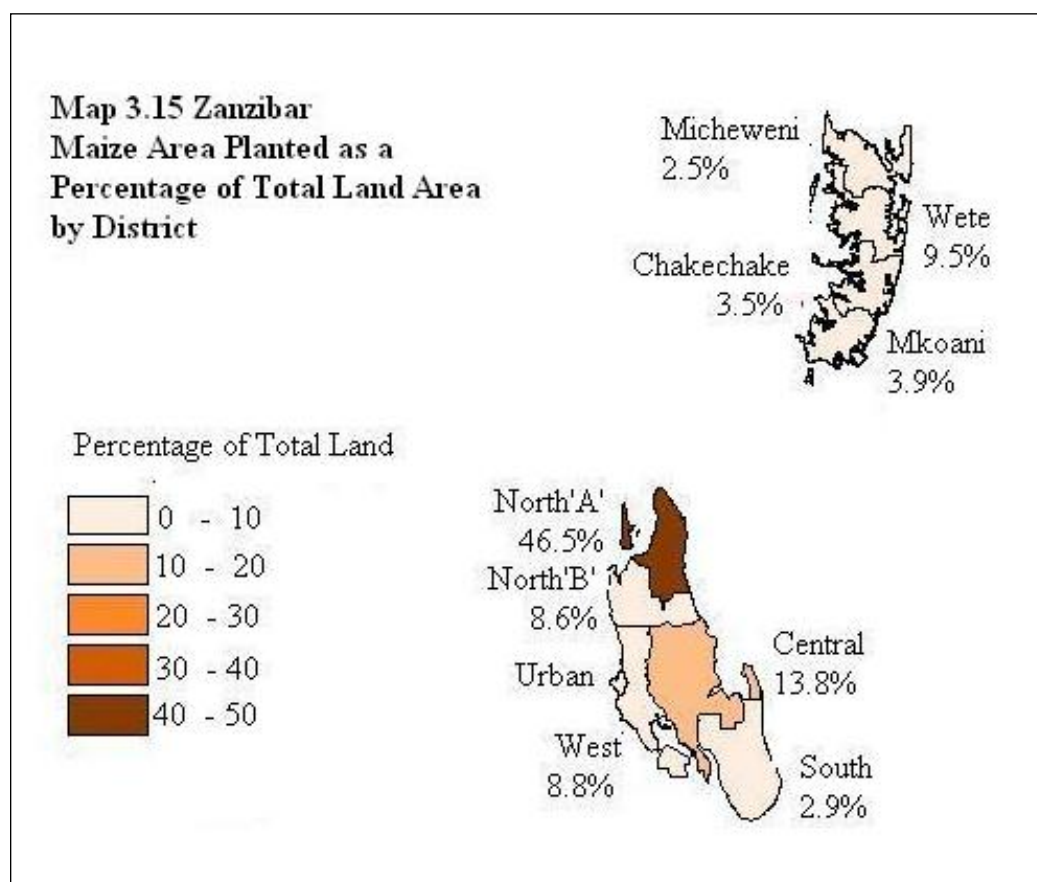

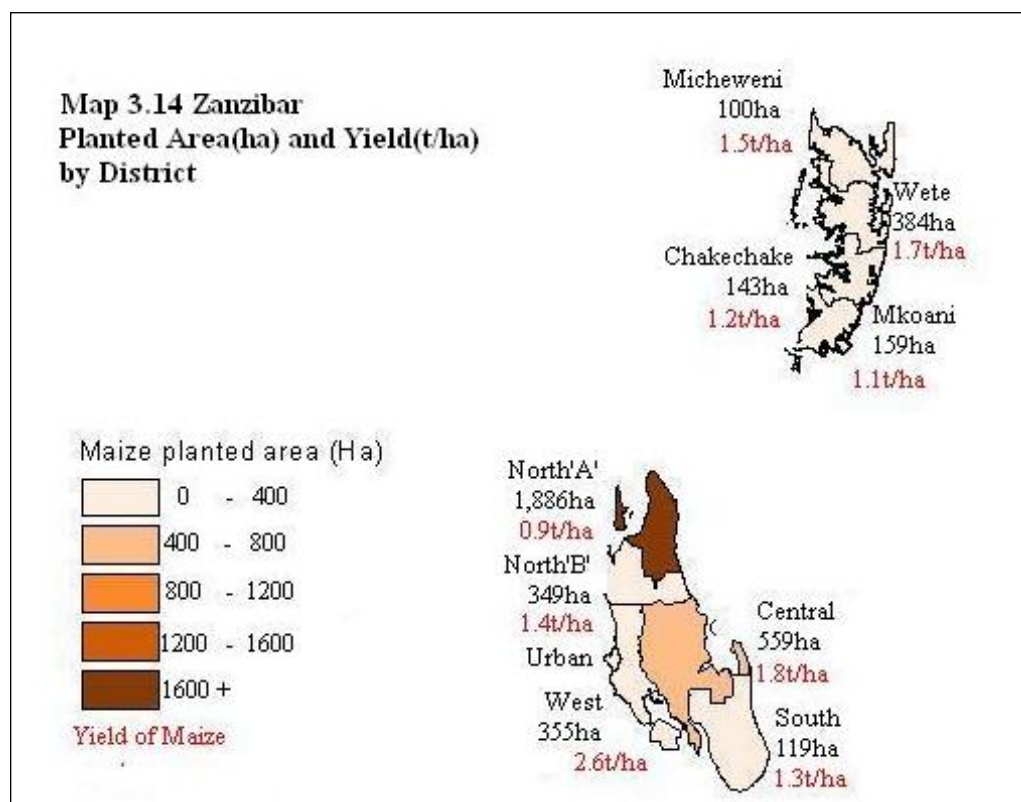

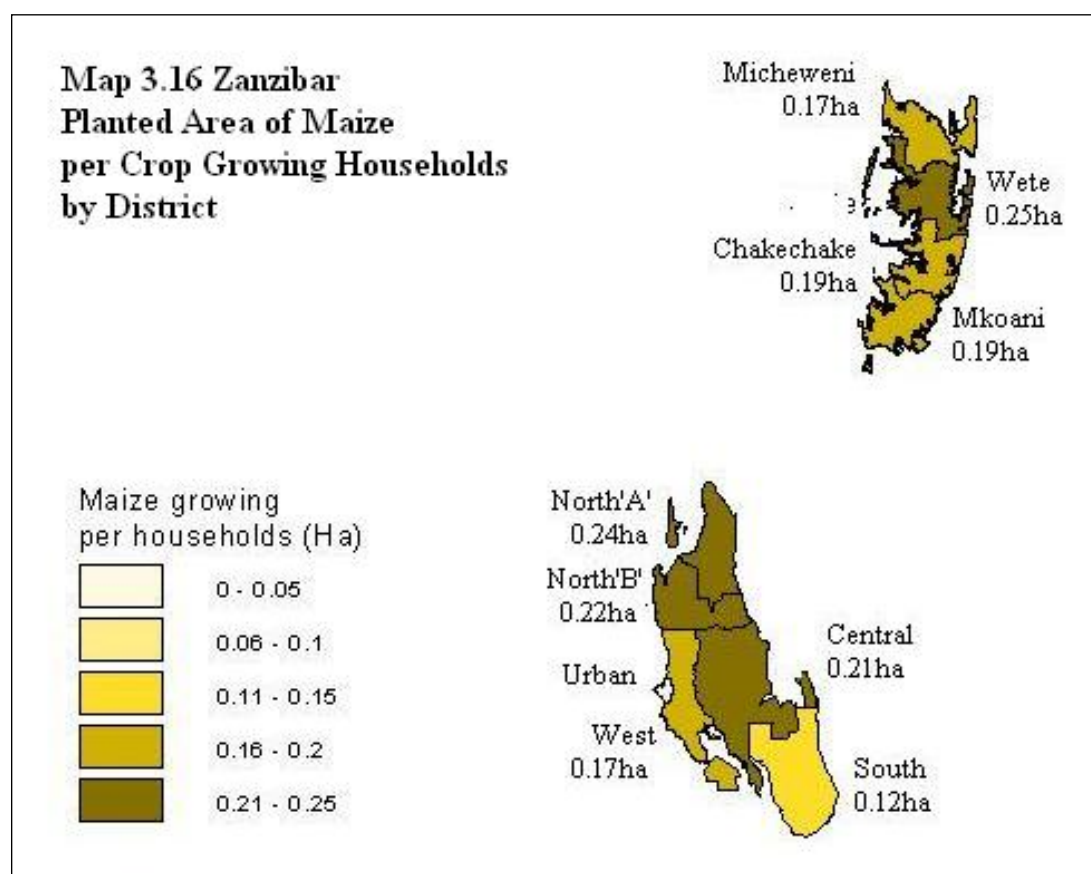

(Chart 3.22, Map 3.19). Central, Mkoani, Chakechake and West districts together accounted for a total of 94 ha (4.9%). Sorghum was planted on a small area of 3 ha in West district and in South district sorghum was not planted. However, in Micheweni district which had the largest planted area, the area under sorghum was equivalent to only 6 percent of the total planted area and being much less in other districts, implying that, sorghum was not a popular crop in Zanzibar.

The number of households which planted sorghum (Map 3.20) followed a similar trend to the planted areas such that it was highest in Micheweni district (4,088 households, 46.8%), followed by North 'A' (2,426 households, 27.8%) and Wete district (1,102 households, 12.6%). Among the remaining districts, 458 households (5.2%) planted sorghum in North 'B' while in Mkoani, Central, Chakechake and West districts, the number of

households that planted sorghum was almost negligible and nothing was planted in South district. Planted areas per household were generally small, the highest being 0.25 ha in North 'B', 0.24 ha in Micheweni, 0.22 in North 'A' and 0.20 in Wete district (Chart 3.23). In the districts with much smaller numbers of households include Mkoani, Central, Chakechake and West each with planted area per household much lower in the range between 0.10 and 0.17 ha.

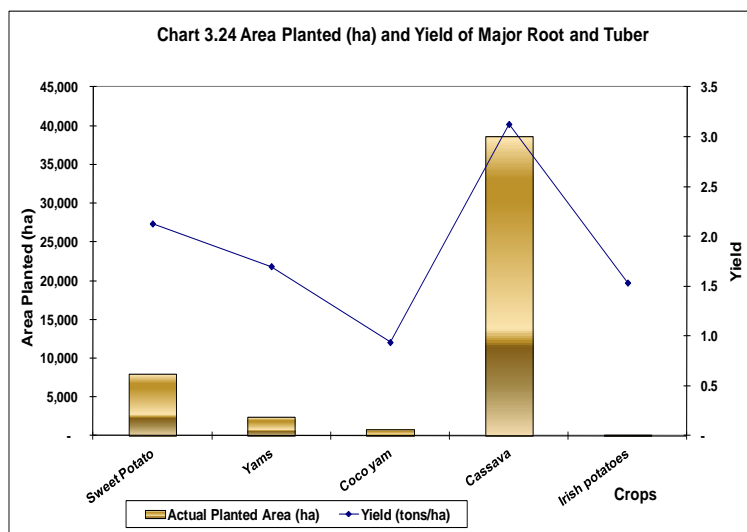

### 3.3.5 Root and Tuber Crops Production

Root and tuber crops constitute a major group of annual crops produced in Zanzibar. All crops in this category were produced in both the short and long rainy seasons with variations in the areas planted and quantities harvested (Table 3.6). Compared to the situation in 2002/03, the actual total planted area with root and tuber crops has increased to 49,902 ha from 41,765 ha planted in 2002/03.

Table 3.6 Area Planted and Quantity Harvested by Season and Type of Root and Tuber Crop				
Crop	Season	Actual Planted Area (ha)	Quantity Harvested (tons)	Yield (tons/ha)
Cassava	Short Rain Season	0	0	0
	Long Rainy Season	38,663	120,911	3.13
Sweet Potatoes	Short Rainy Season	3,101	6,421	2.1
	Long Rainy Season	4,824	10,600	2.2
Irish Potatoes	Short Rainy Season	11	25	2.3
	Long Rainy Season	36	47	1.3
Yams	Short Rainy Season	1757	3084	1.8
	Long Rainy Season	674	970	1.4
Cocoyam	Short Rainy Season	392	397	1
	Long Rainy Season	445	389	0.9
Total	Short Rainy Season	5,261	9,927	
	Long Rainy Season	44,642	132,917	

However, as was the case in 2002/03, root and tuber crops were planted in both seasons of which 44,643 ha were planted during the long rainy season and 5,260 ha were planted during the short rainy season. Sweet potatoes, irish potatoes yams and cocoyams production are presented in both short and long rainy seasons while cassava productions are presented in long rainy season only. Its

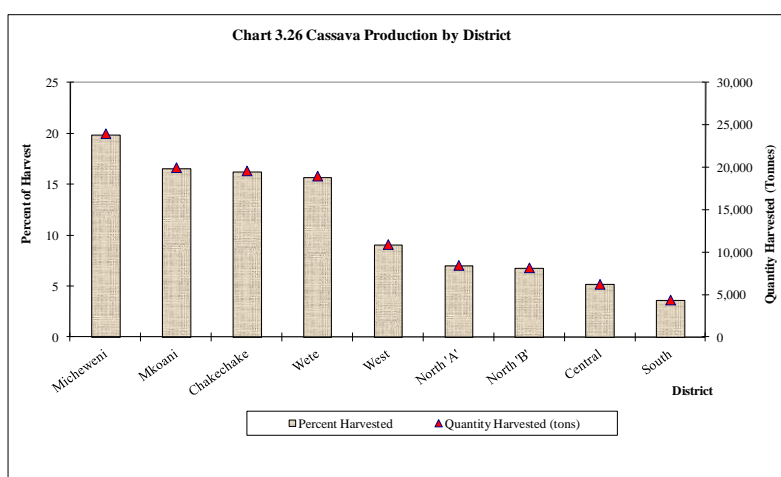

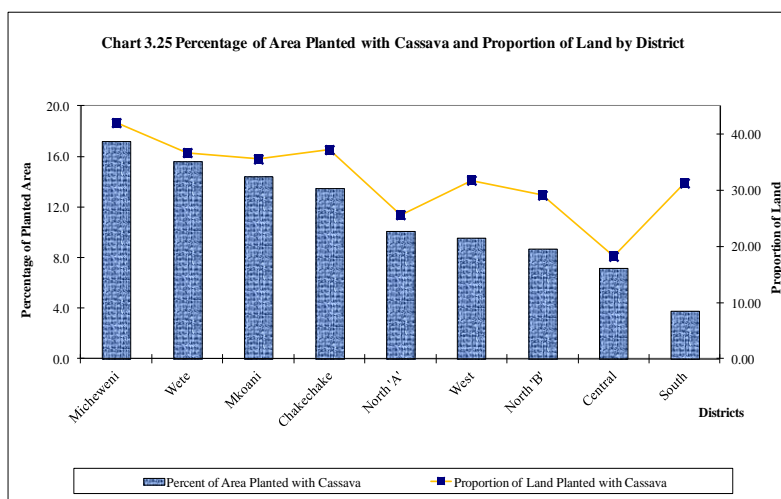

data was reported on permanent crop in order to avoid double counting. Cassava accounted for 78 percent of area planted with roots and tubers, followed by sweet potatoes 16 percent, yams 5 percent, cocoyams 2 percent and Irish potatoes 0.1 percent. The annual production of roots and tubers was 142,691 tonnes of which cassava accounted for 84.7 percent, sweet potatoes 11.8 percent, yams 2.8 percent, cocoyam 0.6 percent and Irish potatoes 0.1 percent (Table 3.6). Average yields across the two seasons (Chart 3.24) were highest for cassava (3.1 tons/ha) followed by Sweet Potatoes ( 2.1 tons/ha) and lowest was coco yam (0.9 tons/ha).

Generally, cassava was the most preference amongst the farmers, on the basis of land areas planted, productivity, and quantities harvested.

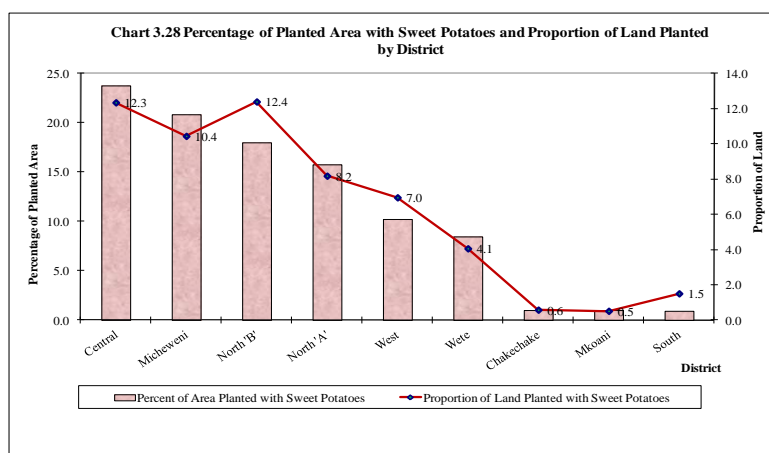

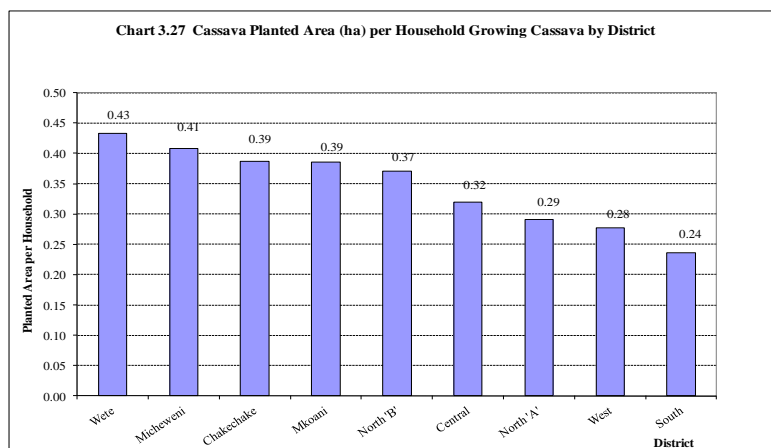

### Cassava

The actual planted area for cassava was 38,663 ha equivalent to 32 percent of the total planted area of 120,325 ha. Micheweni district had the largest planted area (6,643 ha, 17.2%) followed by Wete (6,043 ha, 15.6%) and Mkoani with 5,568 hectares or 14.4 percent. The remaining districts accounted for the area of less than 5300 hectares implying cassava to be the crop of choice for almost the entire farming community. The proportions of land planted with cassava was high in the districts of Micheweni

(42.0%) followed by Chakechake (37.2%), Wete (36.7%) and Mkoani (35.5%). Other districts accounted for less than 35 percent (Chart 3.25 and Map 3.18).

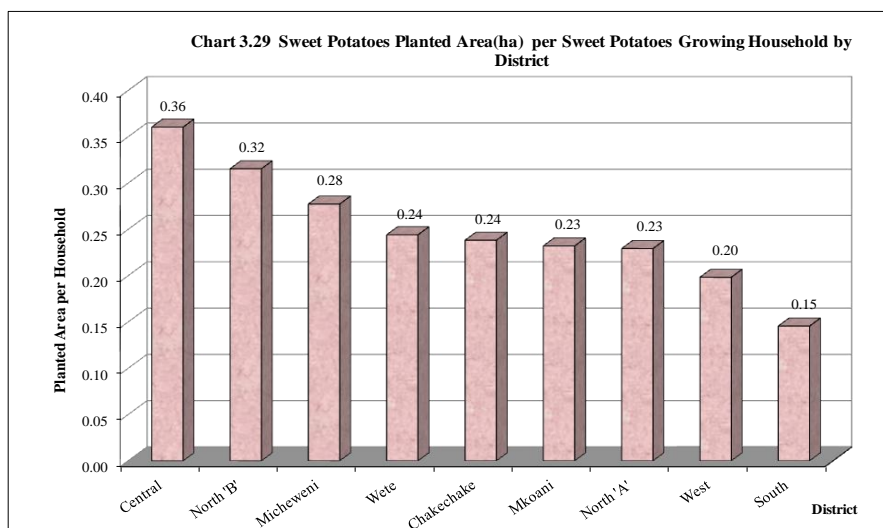

The number of households engaged in cassava production was highest in Micheweni district (16,294 households, 15%), followed by Mkoani (14,441 households, 13%) and Wete (13,940 households, 12.8%). The three districts together accounted for 30.8 percent of the households engaged in cassava production (Maps 3.18 and 3.19). However, the largest harvested quantities were produced in Micheweni district (24,009 tons, 20%), followed by Mkoani (20,006 tons, 17%), Chakechake (19,623 tons, 16%) and Wete (19,007 tons, 16%). The remaining districts contributed to less than 10 percent of the cassava harvest (Chart 3.26).

The highest planted area per household was in Wete district (0.43 ha/household) followed by Micheweni with 0.41 ha/household (Chart 3.27). Planted areas per household were less than 0.4 hectare in the remaining districts.

### Sweet Potatoes

Sweet potatoes was the second most important crop amongst the roots and tubers crops in terms of land area planted, the number of households producing the crop and the quantities

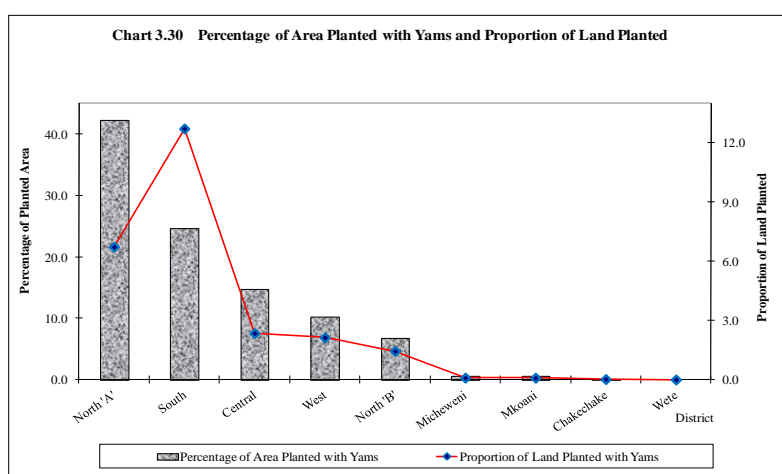

harvested. The crop was planted on 7,924 hectares compared to the 5,231 hectares recorded in 2002/03, (Chart 3.28 and Map 3.21). Central district had the largest area (1,884 ha) and also the largest percentage of planted area under sweet potatoes (23.8%) followed by Micheweni (1,652 ha, 20.8% of planted area), North ‘B’ (1,429 ha, 18% of planted area) and North ‘A’ (1,249 ha, 15.8% of the planted area) (Chart 3.28, Map 3.22).

The total number of households that planted sweet potatoes (29,166) was equivalent to about 22.4 percent of the total 130,353 crop growing households spread across the islands. The largest number of households producing sweet potatoes was in Micheweni district (5,957) which accounted for 20.4 percent of the households engaged in the production of sweet potatoes in Zanzibar. Other districts with similarly large numbers of households producing sweet potatoes were North ‘A’ (5,450 ha, 18.7%), Central (5,228 ha, 17.9%), North ‘B’ (4,530 ha, 15.5%) and West (4,042 ha, 14%). Other districts accounted for 13.4 percent of the households that planted sweet potatoes.

Planted area per household (Chart 3.29) was highest in Central (0.36 ha per hh), followed by North ‘B’ (0.32 ha per hh) and Micheweni (0.28 ha). In all other districts, the planted areas per household were equal or less than 0.25 ha per household and was lowest in South (0.15 ha per hh).

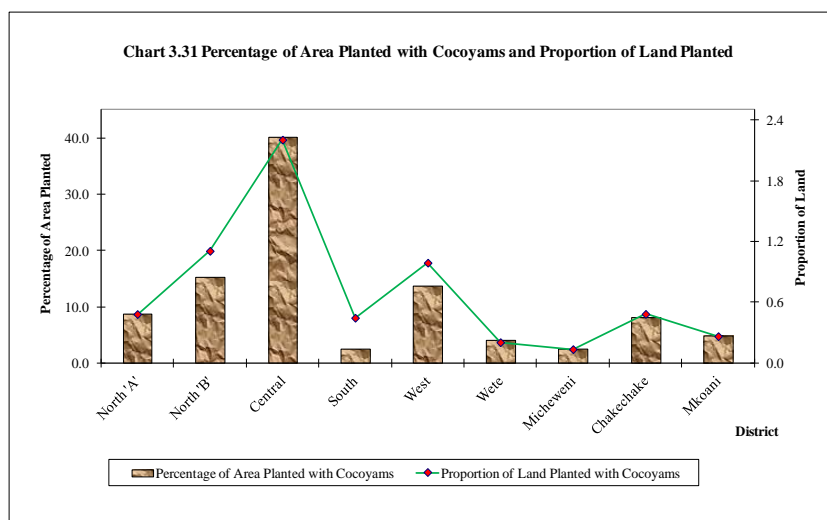

### Yams Production

Yams were planted in all the districts except Wete but on a limited land area (2, 431 ha) equivalent to 2 percent of the total (120,325 ha) planted area of which 1,984 ha (81.6%) of the planted area was in three districts (North ‘A’, South and Central) indicating limited production in the other remaining districts (Chart 3.30). North ‘A’ district was particularly important for yam production as 42.2 percent of the planted area (1,027 ha) was in this district followed by South with 24.6 percent (599 ha), Central with 14.8 percent (359 ha), West with 10.2 percent (249 ha), and North ‘B’ with 6.8 percent (166 ha) of land area planted with the crop. Much smaller land areas were planted with yams in Mkoani and Micheweni with Chakechake district having the smallest planted area (3 ha). There were no records of planted area with yams in Wete district.

### Cocoyam Production

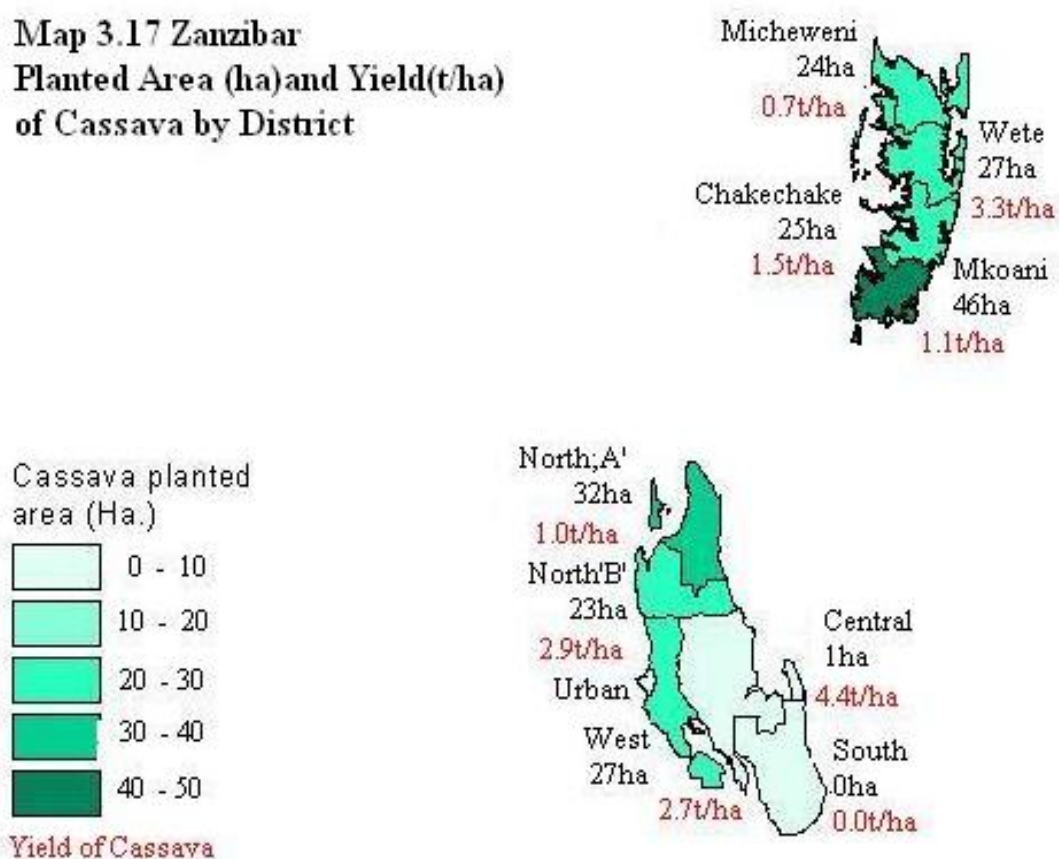

Cocoyams were planted in all the districts but the total area planted was only 838 ha (0.7% of the total planted area). The three districts of Central, North 'B' and West together accounted for 69.1% (578.7ha) of the planted area and Central district alone had 336.2 ha (40.1% of the total planted area) (Chart 3.31). The

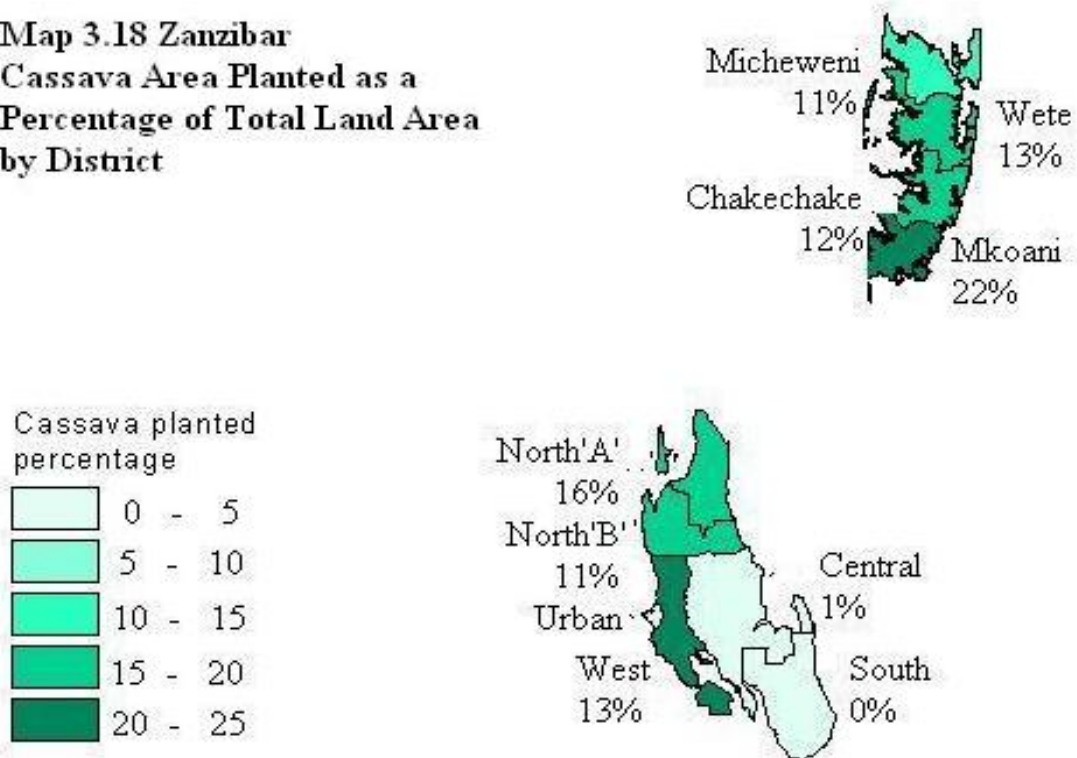

leading districts were Central district with (336 ha, 40.1%) followed by North 'B' (127.5 ha, 15.2%) and West (115 ha, 13.7%) with the other remaining districts having much smaller areas planted with cocoyams. Generally, the proportion of land allocated to cocoyams was very low in all districts, but followed a similar trend to the actual planted area. Central district had the highest percentage (4.7%), followed by West (2.5%), North 'B' (2.1%) and Chakechake (1.2%). Micheweni district had the smallest proportion (0.3%) of the total planted area allocated to cocoyams (Chart 3.31).

Other districts with similarly large numbers of households producing the crop were North 'A' (441 households, 8.8%), Central (1,763 households, 35%), North 'B' (738 households 14.6%), West (848 households, 16.8%), Micheweni (204 households, 4.1%). Planted area per household was highest in Chakechake (0.24 ha) followed by Central (0.19 ha), North 'A' (0.17 ha), North 'B' (0.17 ha), West (0.14 a), South (0.13 ha), Mkoani (0.11ha) and Micheweni (0.11ha).

### 3.3.6 Pulses

The recorded pulse crops were beans, cowpeas, green grams and bambaranuts (Table 3.9) which were planted mostly during the short rainy season (1,385 ha or 62.6%) as compared to the long rainy season (826 ha or 37.4%). Cowpeas were the most popular pulse crop planted on the largest area for the two seasons combined (1,495 ha, 67.6%) and contributed the largest quantities of harvested pulses (758 tons, 59.7%) compared to all other pulse crops (Table 3.7 and Chart 3.32). The only other pulse crop that was planted to a considerable extent was green gram (609 ha, 27.5% of the planted area) which contributed 469 tons over the two seasons equivalent to about 37% of the total harvested pulses. Beans and bambaranuts were much less important pulse crops that were planted on very small areas with a total of 81 ha for beans and 26 ha for bambaranuts.

Yields for pulses were highest for green gram (0.77 tons/ha) followed by bambaranuts (0.68 tons/ha) and cowpeas (0.51 tons/ha). The lowest yield was for beans (0.29 tons/ha). These yield levels generally reflect a very low level of productivity pulse crops.

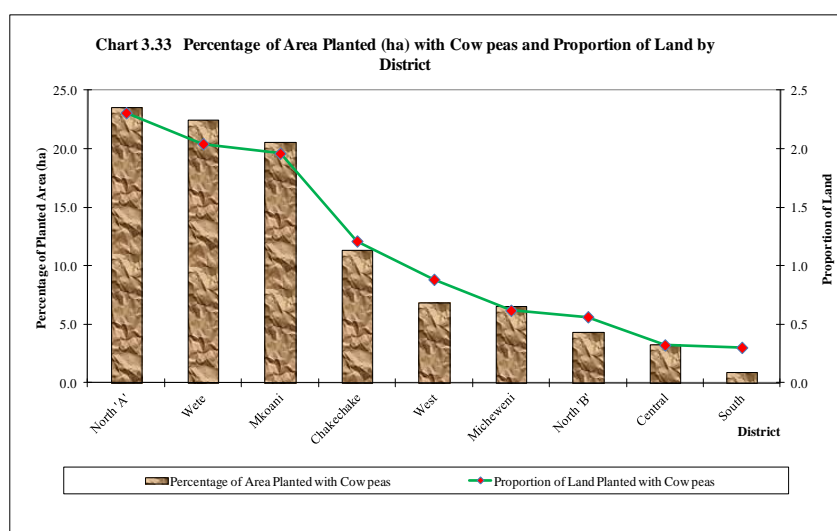

**Table 3.7 Area Planted and Quantity Harvested by Season and Type of Pulse Crop**

Crops	Season	Actual Planted Area (ha)	Quantity Harvested (tons)	Yield (tons/ha)
Beans	Short Season	24	10	0.40
	Long Season	57	14	0.24
Cowpeas	Short Season	1,052	567	0.54
	Long Season	443	191	0.43
Green gram	Short Season	283	338	1.19
	Long Season	326	131	0.40
Bambaranuts	Short Season	26	17	0.68
	Long Season	0	0	0.00
Total	Short Season	1,384.36	931.96	
	Long Season	825.48	336.57	

### Cowpeas Production

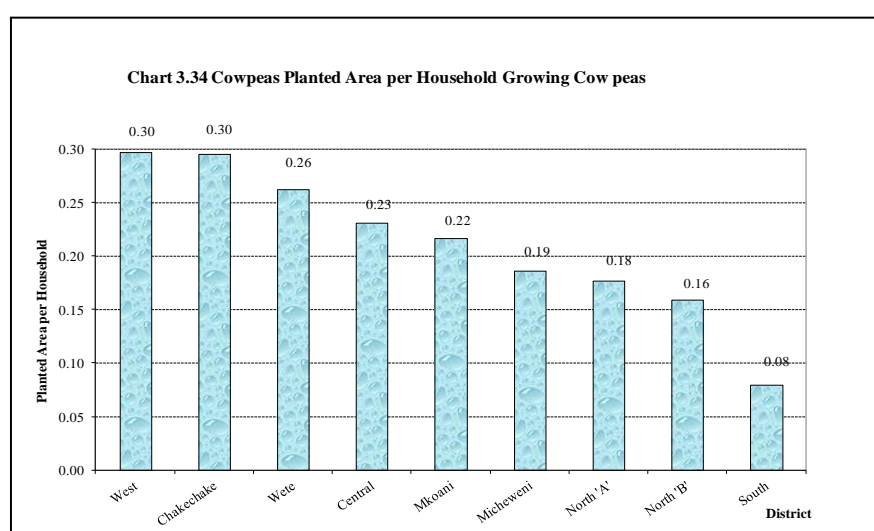

Cowpeas was planted in all the districts but predominantly in four districts (Chart 3.34) which together accounted for 78% of the planted area divided between North 'A' (352 ha, 23.6%), Wete (336.4 ha, 22.5%), Mkoani (307.3 ha, 20.6%) and Chakechake (169.5

ha, 11.3%). Areas planted with cowpeas in the other remaining districts were much smaller with South district having the smallest planted area of 14.2 ha (1.0%). Generally, however, cowpea is a minor crop as it occupied very small proportions of the planted area, the largest being 2.3 ha in North 'A', followed by Wete and Mkoani each with 2 ha, and Chakechake with 1.2 ha. The districts had the proportion of less than one, the smallest proportion being 0.3 ha in South district (Chart 3.33).

A total of 6,928 households planted cowpeas with North 'A' district having the largest number of cowpeas growing households (1,985, 28.6%), followed by Mkoani (1,419, 20.5%), Wete (1281, 18%), Chakechake (574, 8.3%) and Micheweni (526, 7.6%). North 'B', West, Central and South districts had the smallest number of households growing cowpeas.

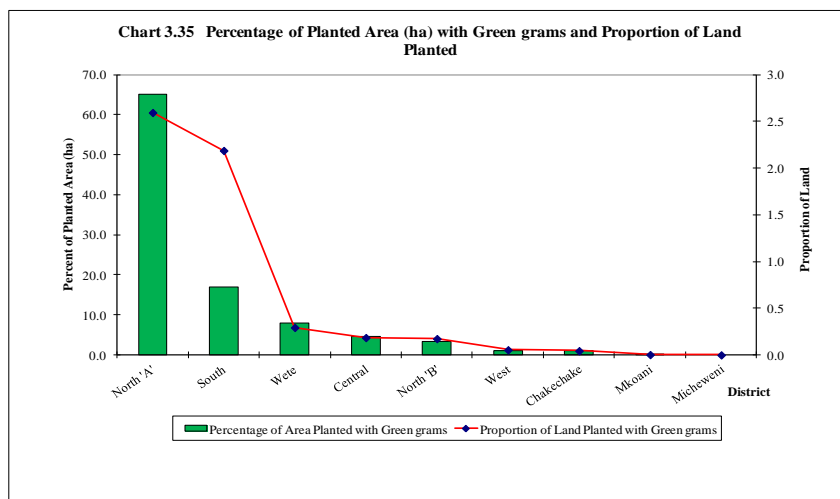

The average planted area per household was small in all the districts (Chart 3.34). The highest planted area per household were found in both West and Chakechake districts each with 0.30 ha/households followed by Wete (0.26 ha), Central (0.23 ha) and Mkoani (0.22 ha). Micheweni, North

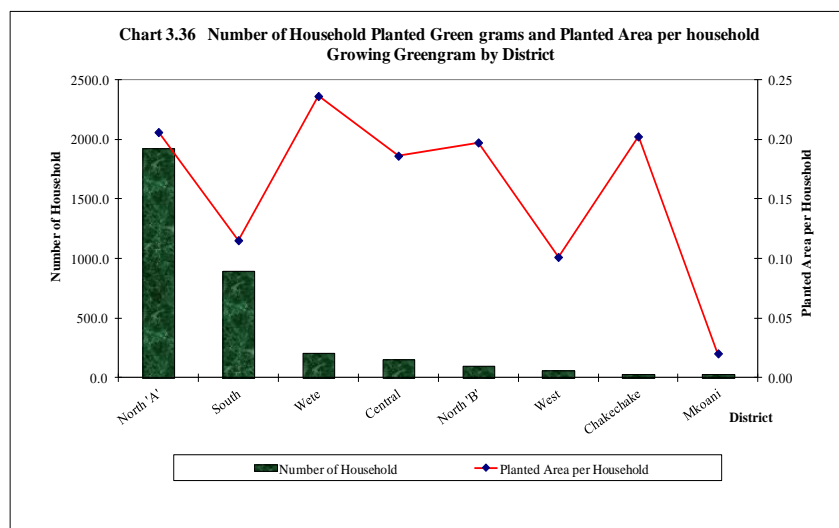

‘A’, and North ‘B’, were in the second tier with 0.19, 0.18, and 0.16 ha/household respectively. South district had the lowest planted area with 0.08 ha per household.

### Green grams

In the overall, green grams occupied very small proportions of the planted area (Chart 3.35), the highest being 2.6% (North ‘A’) followed by South district with 2.2% and Wete (0.3%). In North ‘A’ district, the crop was planted on 396 ha (65% of the planted area), followed by South district (103 ha, 16.9%) and Wete (48.4 ha, 8.0%). The three districts combined accounted for 89.9% of the planted area. Except for Micheweni where green grams were not planted at all, in all other districts, the planted area was less than 30 ha and was smallest in Mkoani with only 0.5 ha or 0.1% planted with green grams (Chart 3.35).

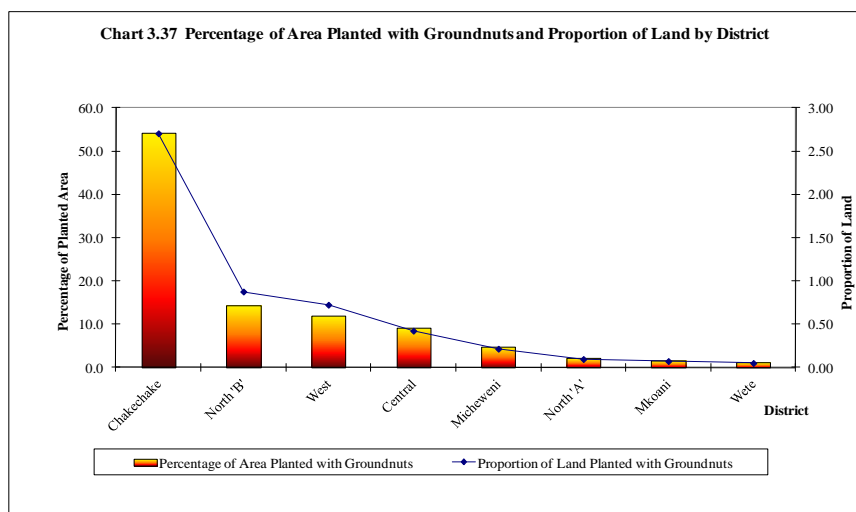

A total of 3,395 households planted green grams (Chart 3.36) with North ‘A’ district having the largest number of households that planted green grams (1,922 households, 56.6%), followed by South (893 households, 26.3%), Wete (205, 6%), The remaining districts accounted for less than 5 percent of the total household growing green gram.

The average planted area per household was small in all districts that planted the crop (Chart 3.36). The highest planted area per household was in Wete district (0.24 ha/hh), followed by North 'A' (0.21ha/hh), North 'B' and Chakechake each with 0.20 ha/hh, Central (0.19 ha), South (0.12 ha), and West (0.10 ha). The smallest area planted per households was recorded in Mkoani district (0.02 ha).

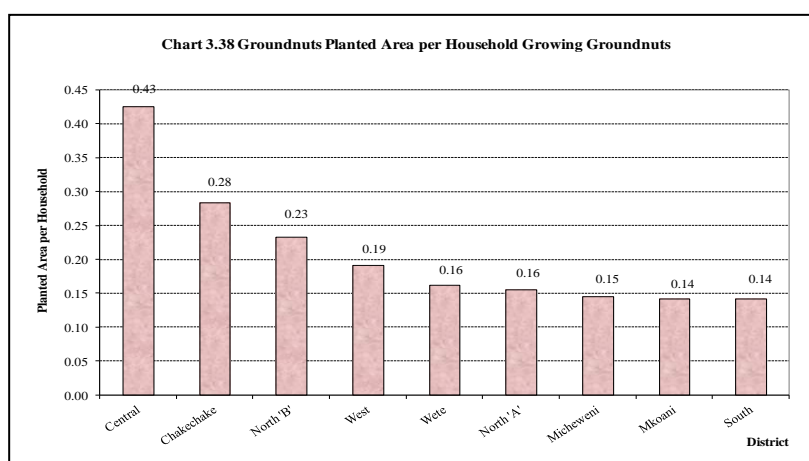

Generally, the green grams were comparatively less popular than cowpeas. The situation was indicative of green gram not being given priority in land allocation and therefore constituted a minor crop.

### 3.3.7 Groundnuts

Chakechake district had the largest planted area and proportion (378 ha, 54.1%) of land under groundnuts followed by North 'B' (101 ha, 14.4%) and West (84.2 ha, 12%) while South (2.3 ha, 0.3%) had the lowest of area planted with groundnuts. Similarly, the districts with the highest proportion of land planted with groundnuts were Chakechake (2.7 ha), North 'B' (0.88 ha) West (0.72 ha). The proportions of land for other districts was less than 0.5 ha (Chart 3.37).

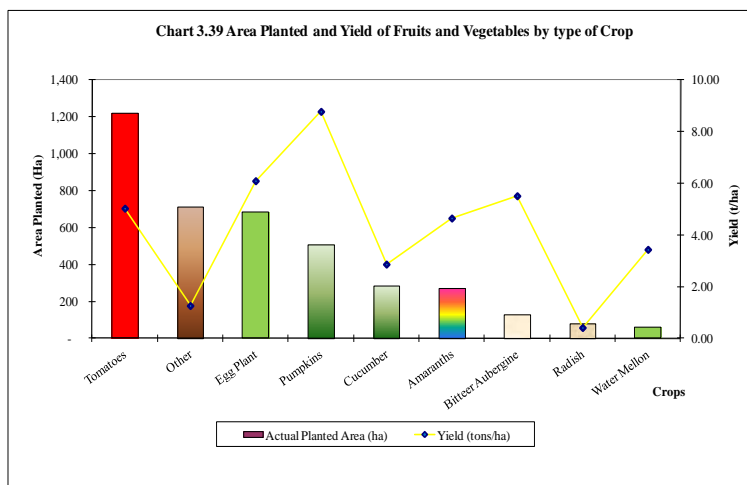

Moreover, with respect to planted area per household growing groundnuts, the districts with the highest planted area per household were Central (0.43 ha), followed by Chakechake (0.28 ha), North 'B' (0.23 ha). On the other hand, South and Mkoani districts each had the smallest

(0.14 ha) planted area per household of growing groundnuts (Chart 3.38).

### 3.3.8 Fruits and Vegetables

In this section various fruits and vegetables including tomatoes, egg plant, and water melon are discussed. A total of 1,987 ha and 1,960 ha were planted with fruits and vegetables during the short and long rainy seasons respectively. Also, 9,483 tons and 9,187 tons were harvested during the short and long rainy seasons respectively. A larger area was planted

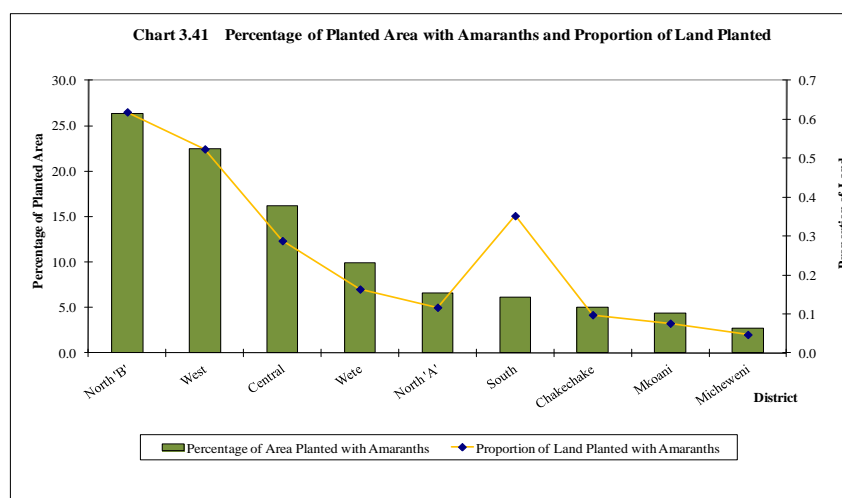

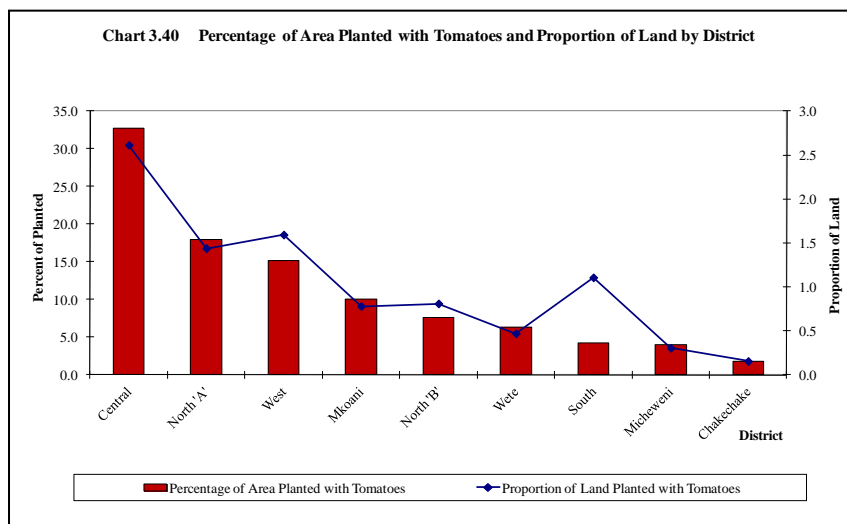

with fruits and vegetables during the short rainy season than in the long rainy season. Similarly, more fruits and vegetables were harvested during the short rainy season than the long rainy season. Tomatoes accounted for the largest area planted with fruits and vegetables followed by other fruits and vegetable and egg plant while the smallest area was planted with water melon. Of all the fruits and vegetables, pumpkins had the highest yield (8.78 ton/ha) followed by egg plant (6.10 ton/ha), and bitter aubergine (5.51 ton/ha) while radish recorded the lowest yield (0.41 ton/ha) (Charts 3.39, Table 3.8).

**Table 3.8: Area Planted and Quantity Harvested by Rainy Season and Type of Fruits and Vegetable Crop**

Crop	Season	Actual Planted Area (ha)	Quantity harvested (tons)	Yield (tons/ha)
Tomatoes	Short Rainy Season	678	2,798	4.6
	Long Rainy Season	609	3,343	4.1
Amaranthus	Short Rainy Season	177	723	4.1
	Long Rainy Season	94	535	5.7
Cucumber	Short Rainy Season	191	572	3

### Tomatoes

The total area planted with tomatoes was 1,220.6 ha. Central district had the largest area planted with tomatoes (399 ha) accounting for 32 percent of the total area planted with tomatoes, which was about twice the area of the second district, namely North 'A' (220 ha, 18%), West (185 ha, 15.2%), and Mkoani (122 ha, 10%). On the other hand, Micheweni district had the eighth highest percentage of area planted with tomatoes (49 ha, 4.0%). Chakechake district had the lowest percentage of area planted with tomatoes (22 ha, 1.8%). The highest proportion of land planted with tomatoes was found in Central district (2.6 ha), followed by West district (1.6 ha) and North 'A' (1.4 ha) whereas Chakechake district, had the lowest proportion of land planted with the crop (0.2 ha) (Chart 3.40 and Map 3.23).

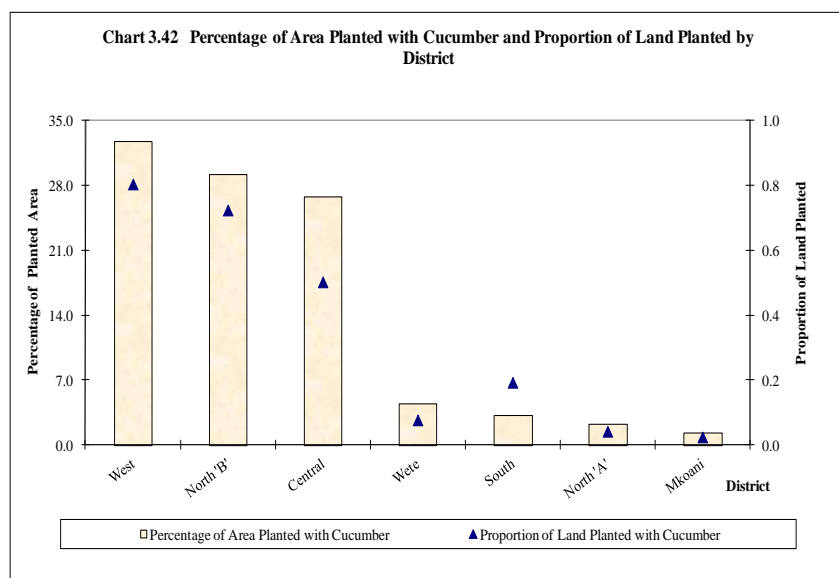

### Amaranthus

A total of 271 ha of the area was planted with Amaranths. North 'B', West and Central accounted for 65.1% (26.4%, 22.5% and 16.2%) of the area planted with the crop respectively. In the overall, the three accounted for more than a half of the area planted with the crop. The third largest area planted with this crop was found in Central district (43.9 ha, 16.2%). The proportion of Land planted with amaranths was high North 'B' (0.6 ha) followed by West (0.5), South (0.4), Central (0.3) and Wete (0.2). Other districts accounted for less than 0.2 ha.

## Cucumber

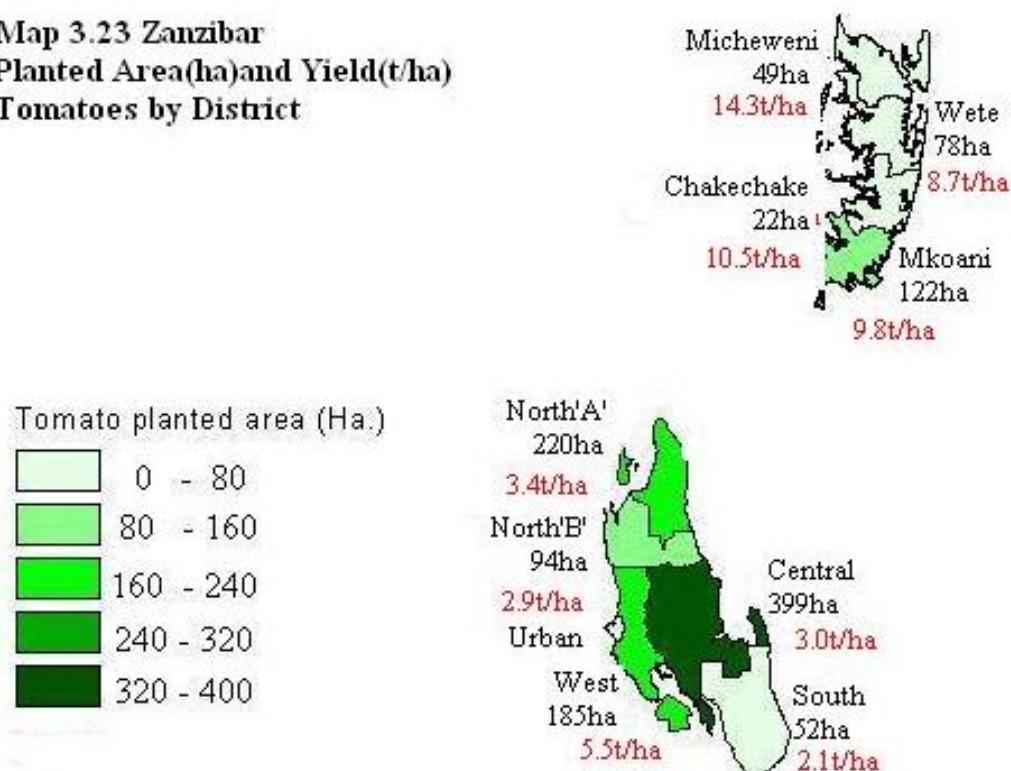

A total of 285.6 ha were planted with cucumber. The distribution of the area planted with cucumber shows that West and North 'B' districts accounted for about 62% of the total area planted with the crop. The other districts with the highest percentage of the area planted with cucumber were Central (76.7 ha, 26.8%). Moreover, Mkoani district had the lowest area planted with cucumber (3.8. ha, 1.3%).

The proportion of land planted with cucumber for all district was very small. West district had the highest proportion of the area planted with cucumber (0.8 ha), followed by North 'B' (0.7 ha) and Central (0.5 ha) while the other districts (Wete, Mkoani, South and North 'A') had the lowest proportion of

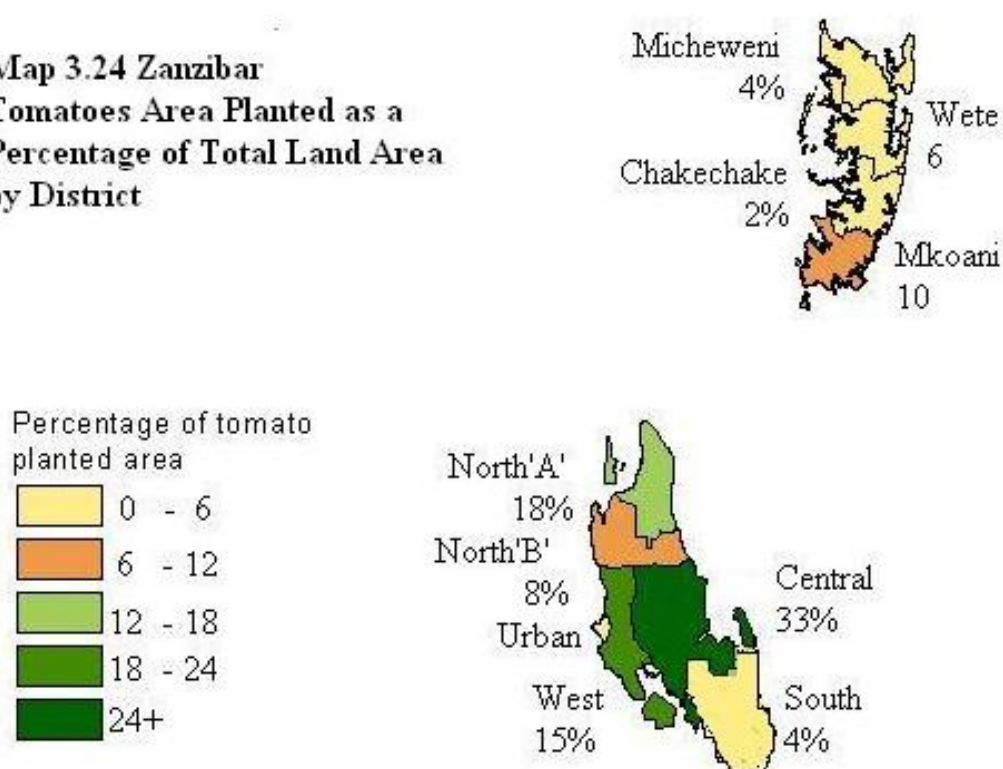

the area planted with the crop. The survey did not capture data for cucumber in Chakechake and Micheweni districts (Chart 3.42 and Map 3.29)

Percent of Total Land Area

## Egg plant

Central district had the highest percentage of area planted with egg plant (31.8%) followed by West (22.9%), and North 'A' (19.3%). The district with the lowest percentage of area planted with the crop was Micheweni (0.7%). In terms of proportion of total land area planted with egg plant, the district with the highest proportion was Central (1.4 ha) followed by West (1.4 ha), South (1.2 ha). The lowest proportion of total land planted with egg plant was recorded in Mkoani (0.04) and Micheweni (0.03) districts (Chart 3.43).

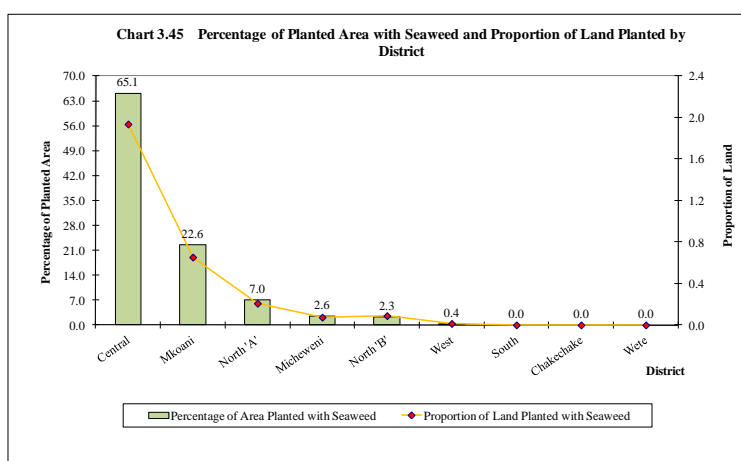

## Pumpkins

The largest areas planted with pumpkins were recorded in Central (201 ha, 39.7%), North 'A' (120 ha, 23.6%) and South (109 ha, 21.5%). On the other hand, Micheweni district had the smallest area planted with pumpkins. However, the highest proportion of total land planted with pumpkins was found in South district (2.3 ha), followed by Central district (1.3 ha), and North 'A' (0.8 ha). Moreover, the lowest proportion was recorded in Micheweni district (0.01 ha) (Chart 3.44).

### 3.3.9 Cash Crop Production

#### Seaweed

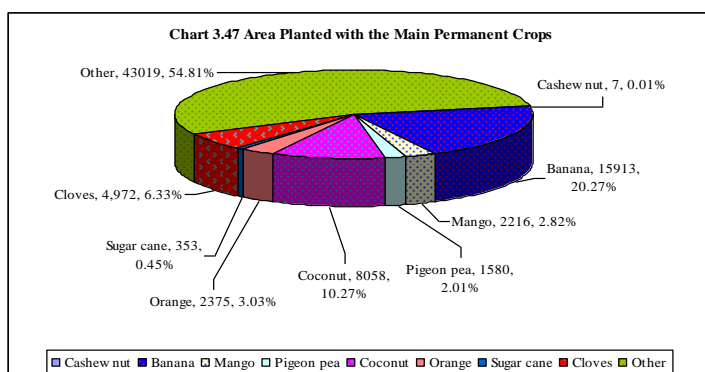

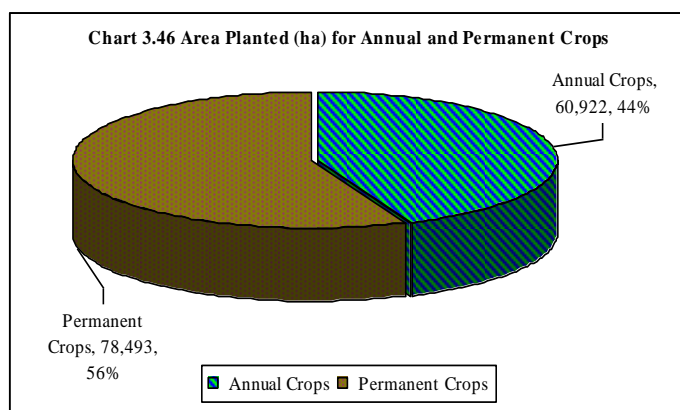

Seaweed was largely produced in Central district (295 ha, 65.1%), followed by Mkoani (102 ha, 22.6%), North 'A' (32 ha, 7.0%), Micheweni (12 ha, 2.6%), North 'B' (10 ha, 2.3%), West (5 ha, 0.4%), South (2 ha, 0.0%), Chakechake (2 ha, 0.0%), and Wete (2 ha, 0.0%) districts (Chart 3.45).

ha, 2.6%), North 'B' (10 ha, 2.3%), and the lowest was West (2 ha, 0.4 %). On the other hand, Wete, Chakechake and South districts recorded no production of the crop. The highest proportion of total land planted with seaweed was reported in Central district (1.9 ha) followed by Mkoani (0.65 ha), and North 'A' (0.21 ha) (Chart 3.45).

### 3.4 Permanent Crops

Permanent or perennial crop refer to crops that normally take over a year to mature and once

matured can take a number of years being periodically harvested. Cassava, sugarcane and bananas are in a sort of transition between annual and perennial crops. For example, there are improved varieties of cassava that mature within a year and produce only one harvest. But there are other varieties of cassava that take more than 12 months before they are harvested. In this report, cassava is treated as an annual crop while bananas and sugarcane are treated as perennial crops. More than half of the area (78,493 ha, 56%) was planted with permanent crops while annual crops accounted for

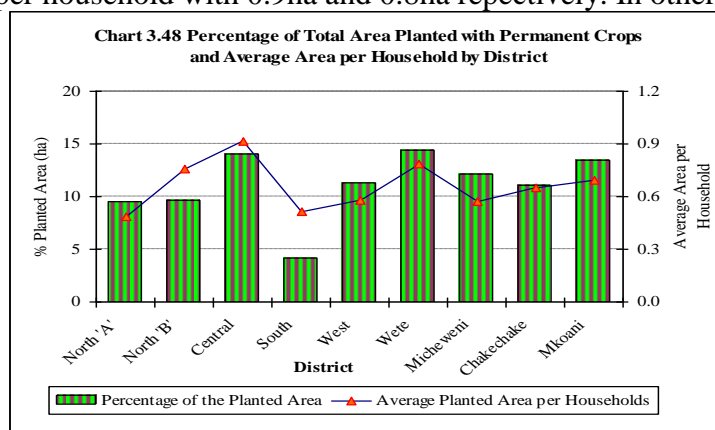

44 percent (60,922 ha) of the area planted with both annual and permanent crops. However, the area planted with annual crops is not the actual physical land area as it includes all the areas of crops planted more than once on the same land, whilst the area planted with permanent crops is the same as physical planted land area. Therefore the percentage of physical area planted with permanent crops could be higher than that indicated in Chart 3.46,

As indicated in Chart 3.47, the largest area (43,019 ha, 55%) was planted with other crops followed by banana (15,913 ha; 20%), and coconut (8,058 ha; 10%). The remaining area was planted with mango (2,216 ha, 3%), orange (2,375 ha, 3%), pigeon pea (1,580 ha, 2%), and cashewnut (7 ha, 0.01%).

Districts wise, Wete had the highest percentage (14.4%) followed by Central (14.1%), and Mkoani (13.5%) of the area planted with permanent crops. While Mkoani, Central, and North 'B' district recorded the highest average planted area per household with 0.9ha and 0.8ha respectively. In other districts, the area ranged between 0.5 and 0.7 ha per household (Chart 3.48).

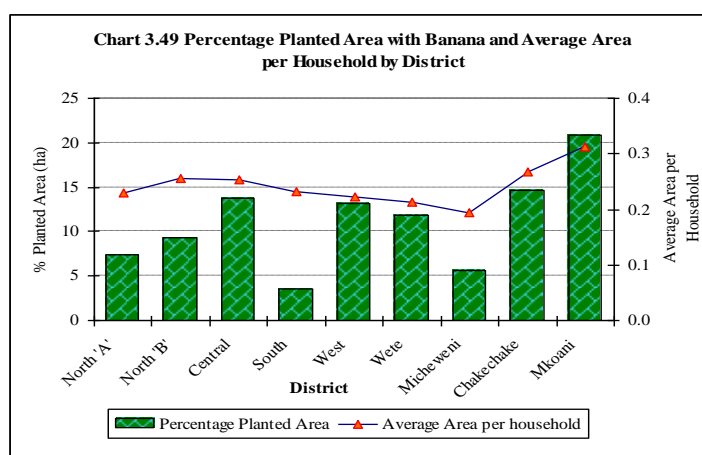

### 3.4.1 Banana

Banana is a food crop cultivated in all the districts and occupied an area larger than any other permanent crop (15,913ha). The area is slightly higher when compared with the area recorded in 2002/03 (13,572ha).

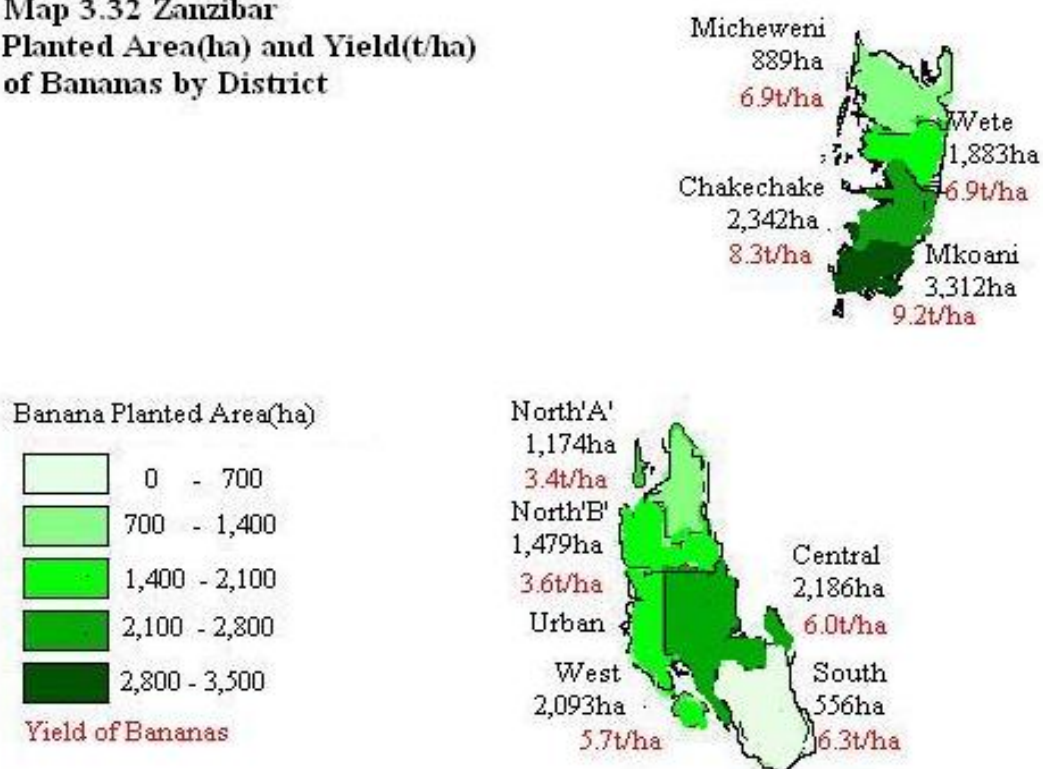

Mkoani (3,312 ha, 21%) recorded the highest percentage of the total area planted with banana followed by Chakechake (2,342 ha, 15%), Central (2,186 ha, 14%), and West (2,093 ha, 13%). The average planted area per household was 0.2 ha. Mkoani, Chakechake, Central and North 'B' all recorded an average of 0.3 ha per household which was the highest. The remaining districts had an average of 0.2 ha per household. (Chart 3.49).

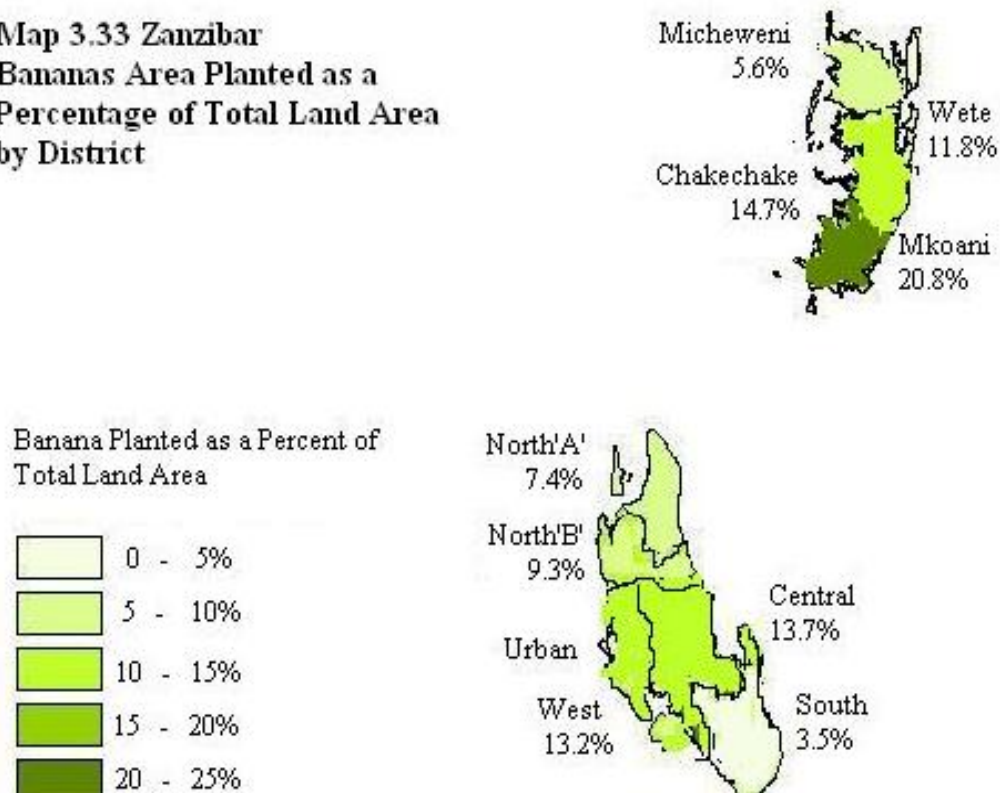

The crop was grown by 64,141 households representing 49 percent of the total households growing crops with a total production of 94,339 tonnes. The total average yield was 6.7 tonnes/ha. There is a variation in productivity among the districts of which the highest yield was recorded in Mkoani district with 24,639 tonnes (9.2 tonnes/ha) followed by Chakechake 19,063 tonnes (8.3 tonnes/ha), Micheweni 5,931 tonnes (6.9 tonnes/ha), Central 11,043 tonnes (6 tonnes/ha). The lowest yield was recorded in North 'B' with 3.4 tonnes/ha.

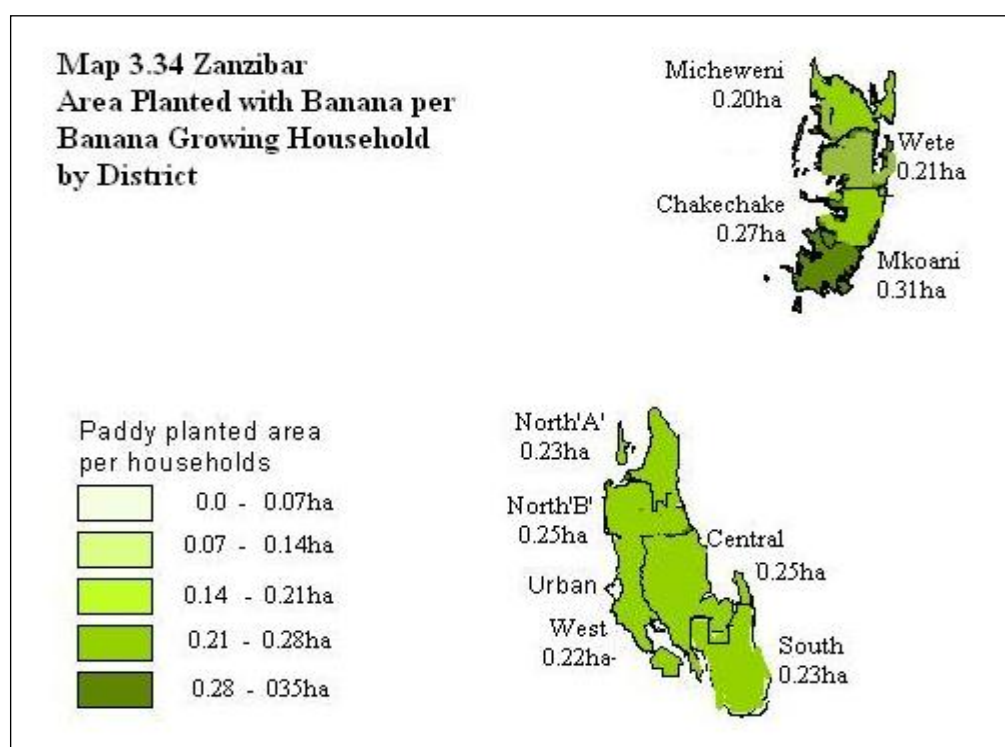

**Map 3.32 Zanzibar  
Planted Area(ha) and Yield(t/ha)  
of Bananas by District**

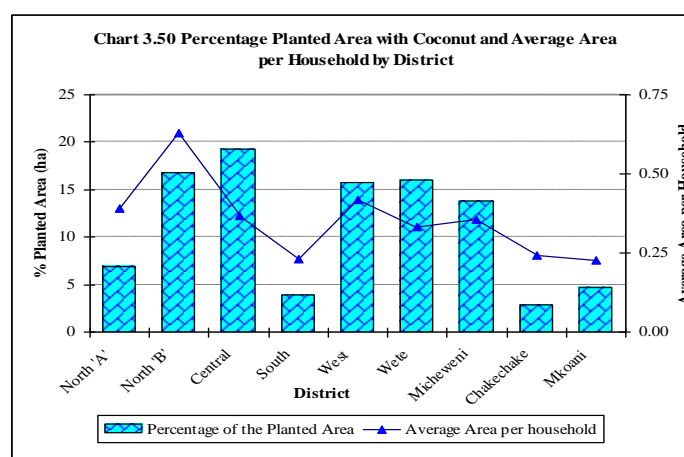

**Map 3.33 Zanzibar  
Bananas Area Planted as a  
Percentage of Total Land Area  
by District**

### 3.4.2 Coconuts

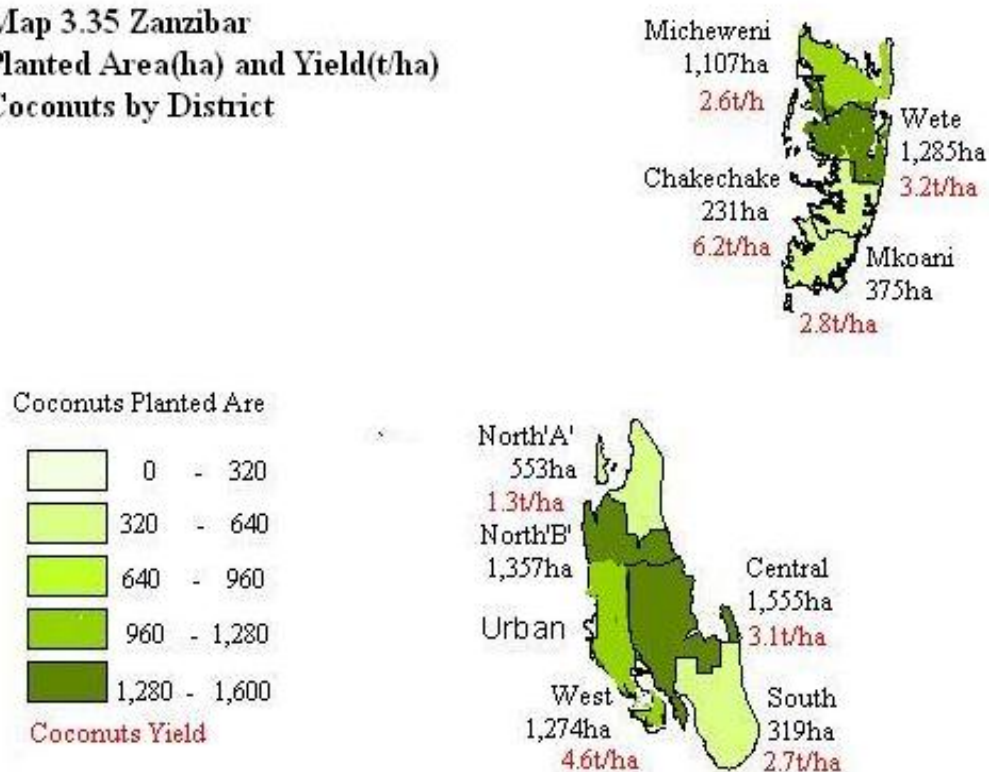

Coconuts were grown in all the districts of Zanzibar, the crop was grown by 21,861 households or about 17 percent of the crop growing households. The total area planted with the crop was 8,058 ha. Central District had the highest percentage (19 %) of the total area planted with coconuts followed by North 'B' (17%) and West and Wete districts each with (16%). In contrast, the lowest percentages of area planted with coconuts were recorded in Chakechake (3%), South (4%), and Mkoani (5%).

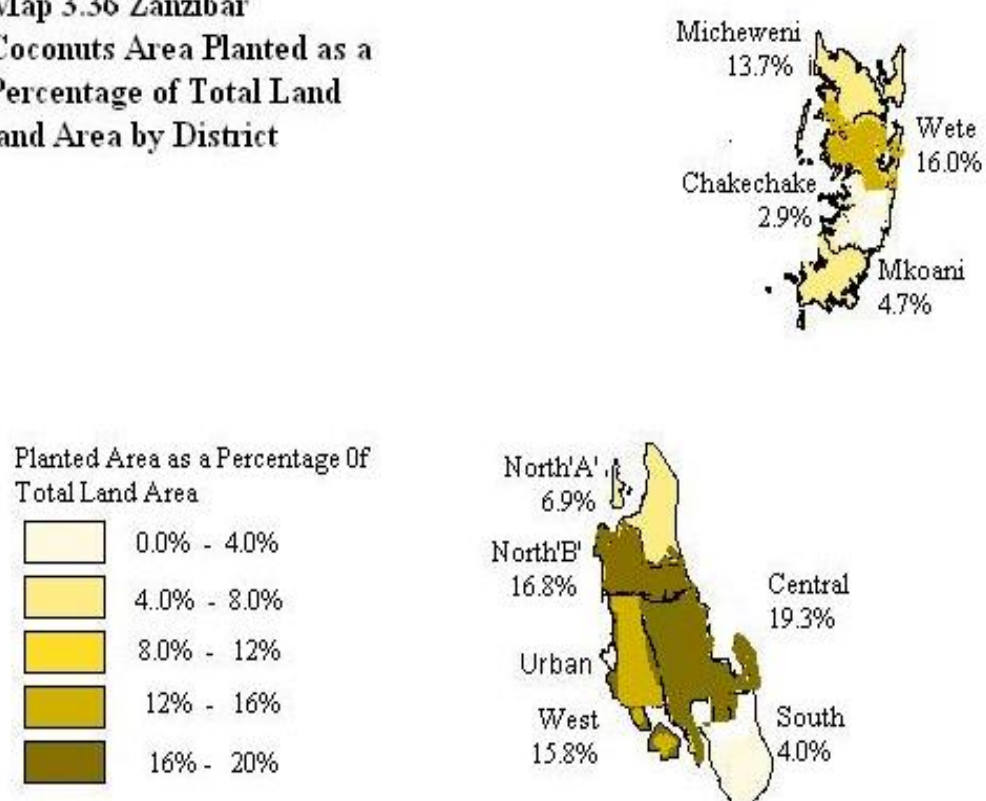

Moreover, North 'B' had the highest average area per household planted with coconut trees (0.63 ha), followed by West (0.42 ha), and North 'A' (0.39 ha/household). The lowest average area per household planted with coconuts were found in Mkoani (0.23 ha), South (0.23. ha), and Chakechake (0.24 ha/household) (Chart 3.50).

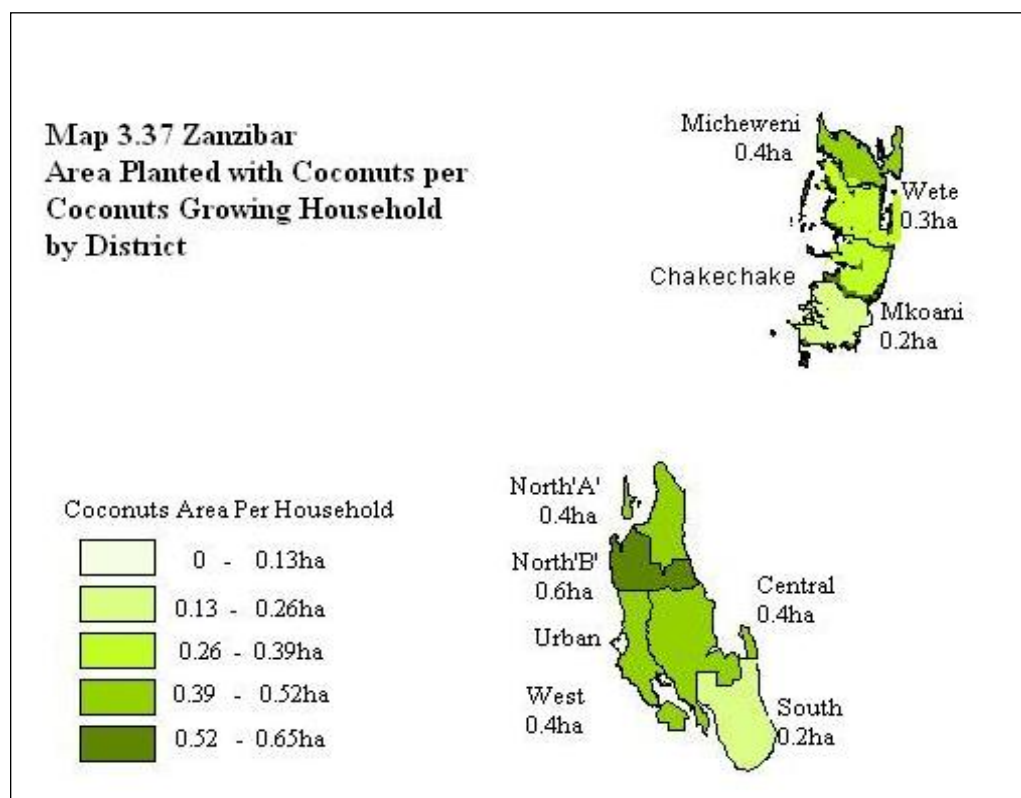

The total production was 14,514 tonnes and the average yield was 3.3tonnes/ha. Wete district produced 2,999 tonnes (21%) of the total production followed by Micheweni with 2,546 tonnes (18%), West with 2,473 tonnes (17%). North 'B' district had the least production with 310 tonnes (2%).

**Coconuts by District**

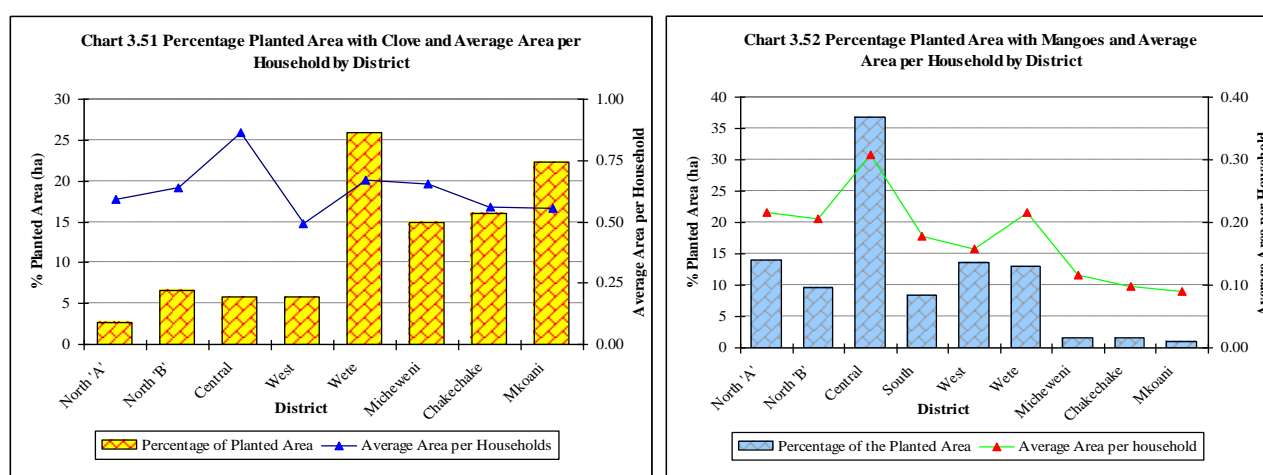

**Map 3.36 Zanzibar**  
**Coconuts Area Planted as a**  
**Percentage of Total Land**  
**and Area by District**

### 3.4.3 Cloves

Cloves were grown in all the districts except in South district. The total of 8,139 households planted the crop (6 percent of the crop growing households) on 4,972 ha. The total production recorded was 8,007.3 tonnes.

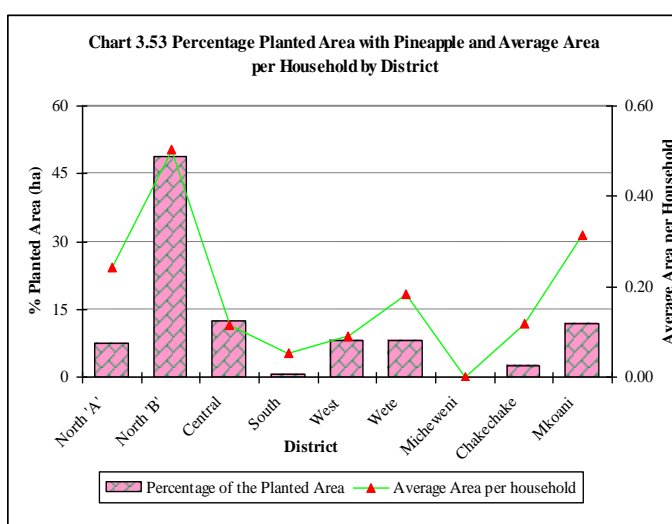

Wete and Mkoani districts accounted for 25.9% and 22.3% respectively of the total planted area, which is almost half of the area planted with the crop. The remaining percentage of the area was shared by the other districts with Chakechake, Micheweni and North 'B' accounting for 16%, 15%

and 6.5% respectively. In contrast, North 'A' had the lowest percentage of the area planted with the crop with only 2.6 percent. On the basis of the average area planted with clove trees per clove growing households Central had the largest area (0.86 ha), followed by Wete (0.67 ha), Micheweni (0.65 ha), North 'B' (0.64ha) and the least district was West with 0.49ha (Chart 3.51).

### 3.4.4 Mangoes

As with most of the crops, mangoes are cultivated by smallholders all over Zanzibar and a total of 2,216 ha was occupied by the crop. Central district accounted for almost over a third (37%) of the area planted with mangoes. The other districts with the highest percentage of area planted with mangoes were North 'A' and West each with about 14 percent of the planted area followed by Wete (13%). However, Mkoani (1%), Chakechake (2%) and Micheweni (2%) recorded the lowest percentage of area planted with mangoes. With respect to average area planted with mangoes per mango growing household, Central district had the largest average (0.31 ha) followed by North 'A' and Wete each with (0.22. ha) , North 'B' (0.21 ha), Micheweni (0.12 ha), Chakechake (0.10 ha) while Mkoani recorded the smallest area with (0.09 ha/household) (Chart 3.52).

In total, mango trees were planted by 10,388 households (8 percent of the crop growing households). The total production during the 2007/08 agricultural year was 10,111 tonnes. The highest production was in Central district with 39 percent of the total production followed by Wete with 22 percent, West 11 percent. Micheweni district had the the lowest production with only 2.5 percent of the total production.

### 3.4.5 Pineapple

The crop was planted by 3,107 households (2.4% of the crop growing households). The total planted area was 706.3 ha representing one percent of the total area planted with permanent crops. The total production was about 5,954.02 tonnes and the average yield was 9 tonnes/ha but varied by district.

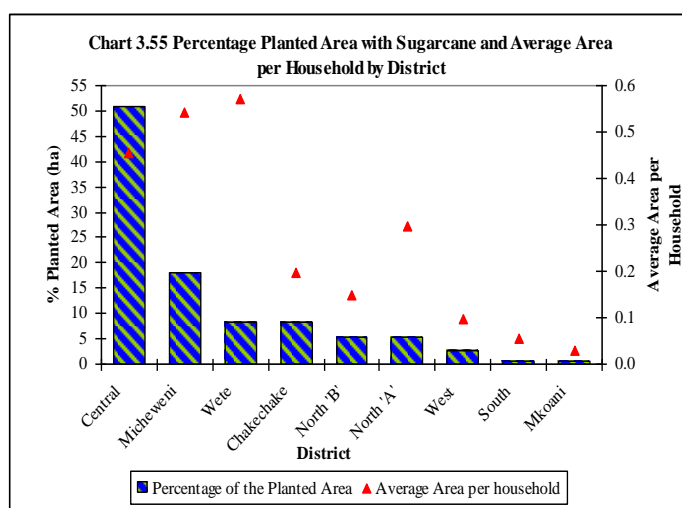

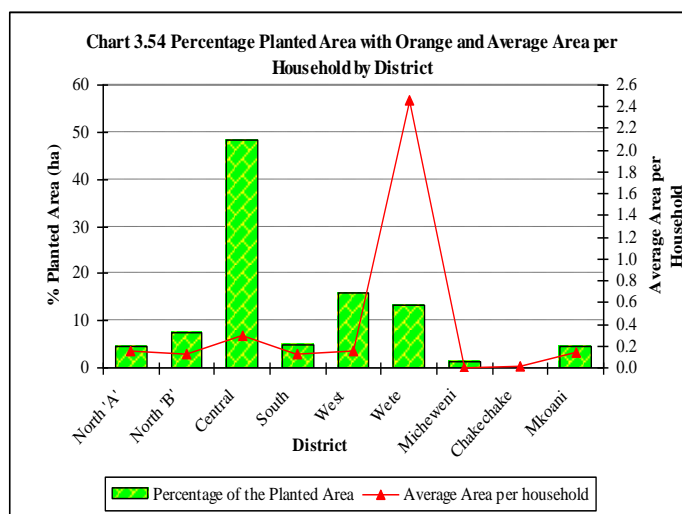

The crop was largely planted in North 'B' district, which accounted for 48.9% of the total area planted with the crop. Central was the second district accounting for 12.2%, almost four times less

than the area planted with pineapples in North 'B'. However, the contribution of other districts was less significant. In fact, no cultivation of pineapples was done in Micheweni district. Similarly, North 'B' had the largest average area per household planted with pineapple (0.5 ha), followed by Mkoani (0.3 ha) while other districts had areas ranging from 0.1 to 0.2 ha/ household, (Chart 3.53).

### 3.4.6 Oranges

A total of 10,146 households planted the crop (8 percent of the crop growing households). The total production was 10,938 tonnes with an average yield of 9 tonnes/ha produced from a total of 2,375 ha.

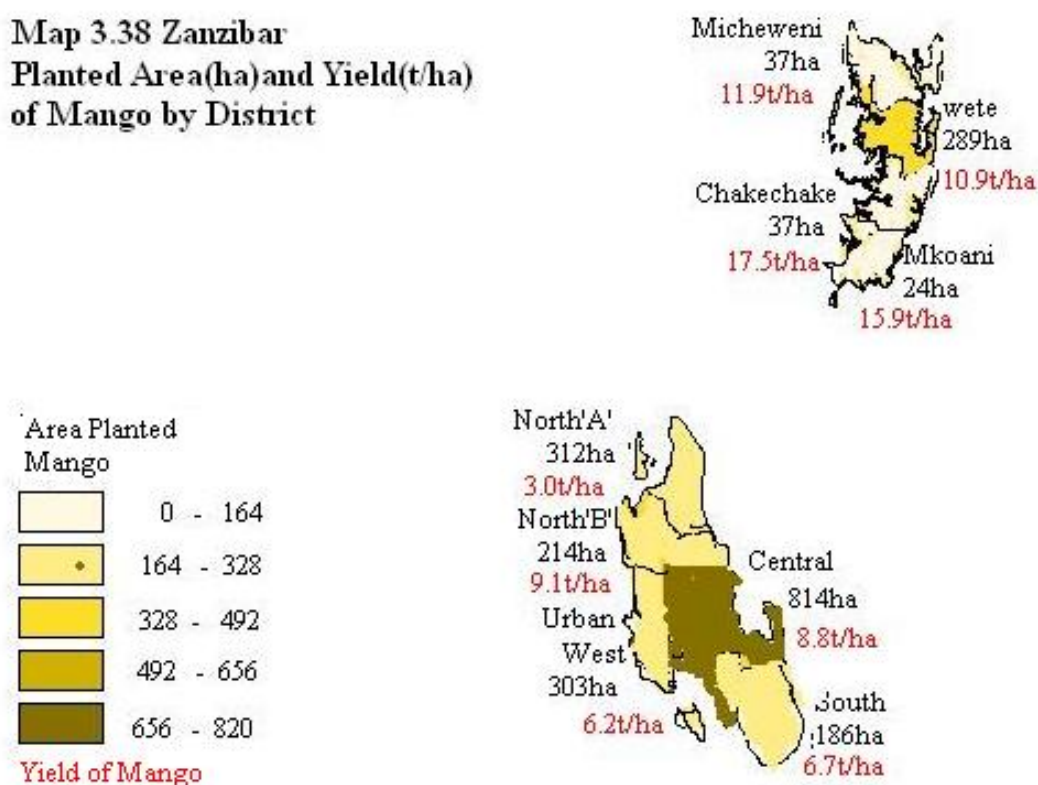

Central district accounted for almost 50 percent (48.3%) of the area planted with orange trees. The remaining area was shared by West (15.9%) and Wete (13.3%) while other districts accounted for the lowest percentage of the area planted with the crop. Nevertheless, there were no orange trees grown in Chakechake. However, Wete district had the largest average area per household (2.46 ha), followed by Micheweni (0.51 ha) and Central (0.30 ha/household). On the other hand, Chakechake had the smallest area (0.02 ha/household) (Chart 3.54).

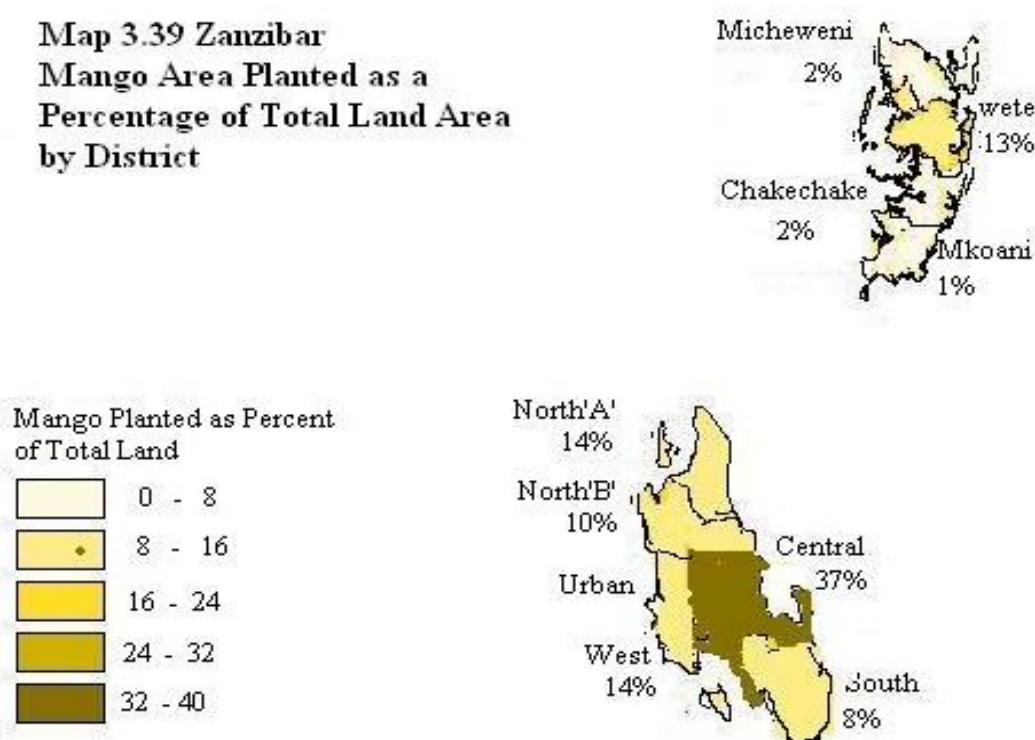

### 3.4.7 Sugarcane

A number of smallholders engaged in sugarcane growing were 1,124 households representing only one percent of the total crop growing households. The total land area of 353 ha was used to cultivate the crop, and the production was 3,647 tonnes with an average yield of 12 tonnes/ha. Central district accounted for 51% of the total area planted with sugarcane followed by Micheweni (18 %). In other districts, the area planted with sugarcane was rather small with Mkoani having the lowest percentage of the area planted with sugarcane (0.65%). Moreover, the largest average area planted area per household was recorded in Central (0.46 ha/household) (Chart 3.55).

### 3.5 Irrigation

Water is important for crop production in Zanzibar. In fact, without water most other agricultural practices applied to a crop will not result in a significant increase in yield. This section deals with the area under irrigation for different crops and the means by which water is extracted from the source and applied to the field.

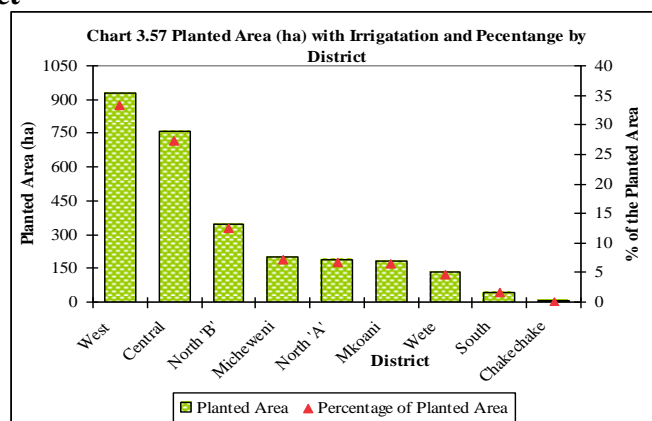

#### 3.5.1 Planted Area of Irrigated Land

Generally, irrigated farming was quite limited with only 5 percent (2,777 ha) of the land under irrigation for annual crops, while the rest (58,145 ha, 95%) of the land remained unirrigated. From the total irrigated area, 53 percent was used during the short rainy season and 47 percent in the long rainy season due to the fact that irrigation was mostly used to compliment rain water (Chart 3.56).

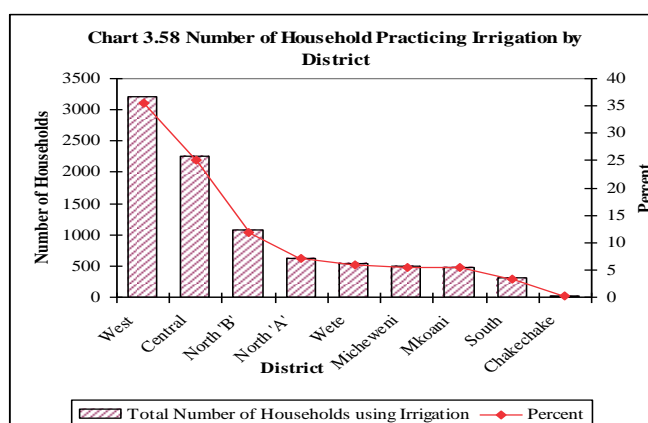

#### 3.5.2 Planted Area with Irrigation by District

The total planted area with irrigation was 2,777 ha. Besides, West had the highest percentage of the irrigated land (927 ha, 33%) followed by Central (757 ha, 27%), North 'B' (348 ha, 13%), Wete (5%), and South (2%) while in Chakechake district, less than 1% of the land was irrigated (Chart 3.57).

#### 3.5.3 Households Practising Irrigation

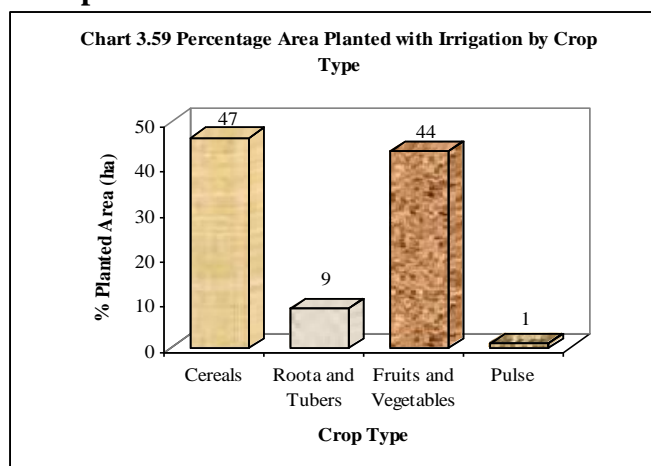

A total of 9,007 households were engaged in irrigation practice, 53 percent in short rainy season and 47 during the long rainy season.

West district had the largest number of households which practiced irrigation (3203, 36%), followed by Central and North 'B' districts with 2,249 households (25%) and 1,069 households (12%) respectively. The smallest number of households which practiced irrigation was recorded in Chakechake district which accounted for less than one percent (Chart 3.58).

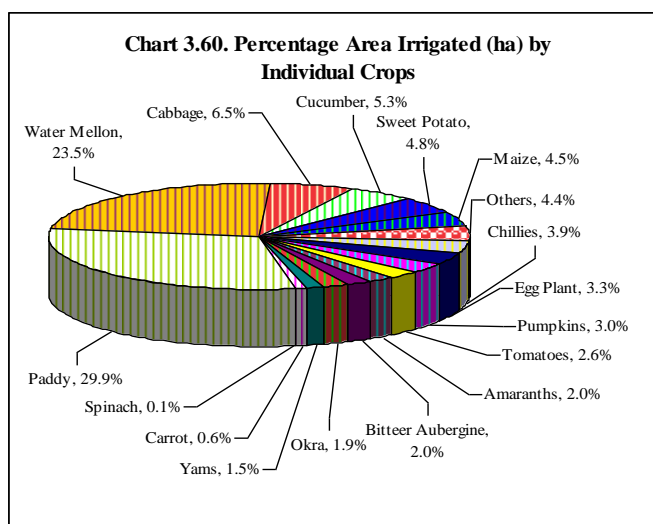

### 3.5.4 Planted Area with Irrigation by Type of Crop

Various types of crops were planted with irrigation during short and long rainy seasons. The largest area was planted with cereals (1296.4 ha, 46.8%) while the remaining irrigated area was planted with fruits and vegetables (1210. ha, 44%), roots and tubers (241.7ha, 9%), and other crops accounted for 1% (Chart 3.59).

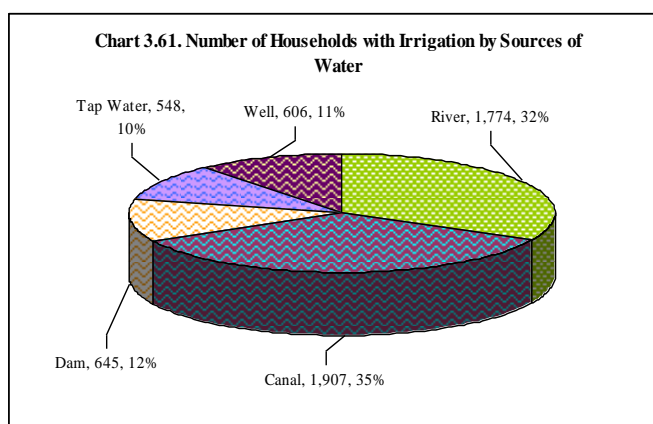

### 3.5.5 Irrigated Area by Individual Crops

The three leading crops with the largest area planted with irrigation for annual crops were paddy (1,083 ha, 30%), followed by Water Mellon (852 ha, 24%), Cucumber (193 ha, 5%). Other crops includes tomatoes (94 ha, 2%), egg plant (121 ha, 3%). On the other hand, crops with the smallest area planted with irrigation were carrot (21 ha, 0.6%), Spinach (5 ha, 0.1%), and cabbage (0.4 ha, 1%). Moreover, irrigation was not practised in growing tumeric (Chart 3.60).

### 3.5.6 Households Practising Irrigation by Source of Water

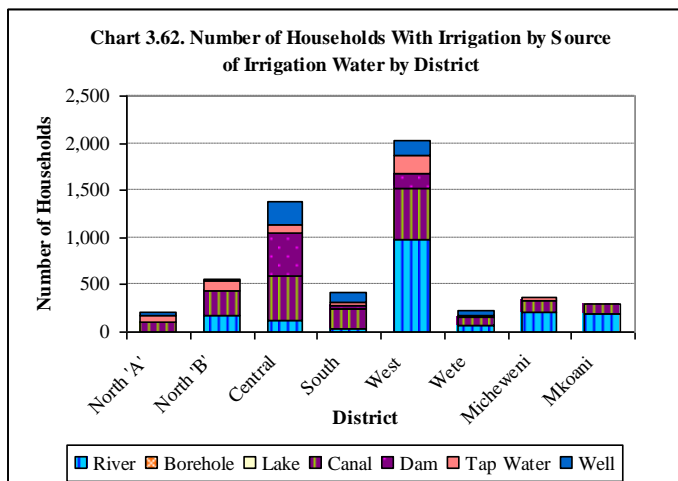

Regardless of the rainy seasons, the actual number of households which practiced irrigation were 5,482 households out of

which 1,774 (32%) used rivers as the main source of water for irrigation followed by canals (1907 households, 35%), dams (645 households, 12%). Other sources such as wells and tap water accounted for about 11 and 10 per cent respectively (Chart 3.61).

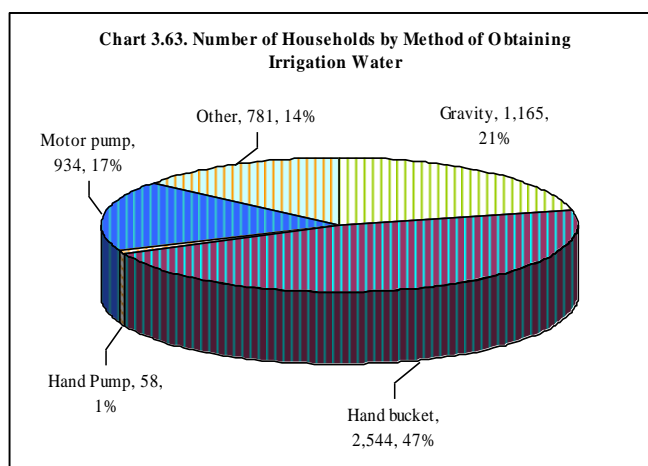

### Households with Irrigation by Source of Irrigation Water by District

A total of 5,482 households practised irrigation. Generally, the importance of source of water for irrigation varied greatly between districts. Therefore rivers, for example, were an important source of water for irrigation in West, Micheweni, and Mkoani districts. Wells and canals were equally important sources of water in North 'B' district. Canals were important source of irrigation water in South district while for Central, dams were the main source of irrigation water (Chart 3.62).

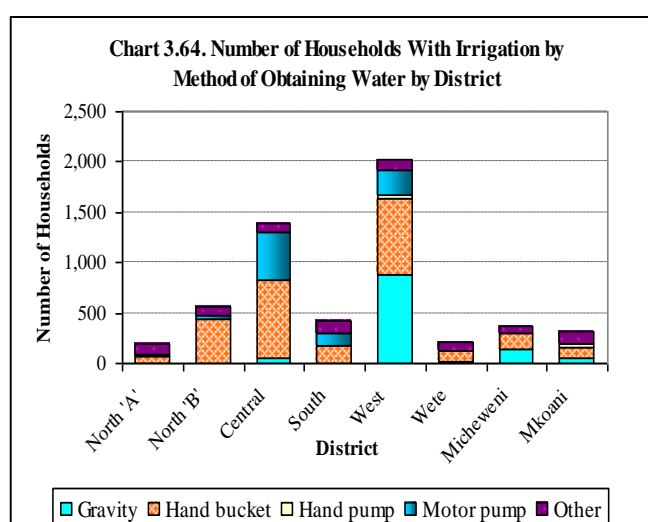

### Households by Method of Obtaining Irrigation Water

Hand bucket was the most common method used to obtain water for irrigation as it accounted for 47% of all the households which practiced irrigation. In terms of importance this method (hand bucket) was followed by gravity (1,165 households, 21%), and motor pumps (934 households, 17%). Other methods (781 households, 14%) and hand pumps (58 households, 1%) were the least used methods for obtaining irrigation water (Chart 3.63).

### Households with Irrigation by Method of Obtaining Water by District

Various methods were used to obtain water for irrigation even though their importance varied between districts. However, except for West district where gravity was the main method used, hand bucket remained the most important source of obtaining irrigation water in the remaining districts. Moreover, hand bucket was equally important with gravity as a means of obtaining irrigation water in Micheweni district (Chart 3.64).

### 3.6 Use of Inputs

Access to inputs among the farming households is essential for improved crop yield. Table 3.9 presents data on the use of various inputs including improved seeds, pesticides/fungicides, inorganic and organic fertilizers during the short rainy season. The table shows that, the number of households which used organic fertilizer was only 7,502 households representing 18 percent of the total households which planted crops using fertilizer in the short rainy season.

Other inputs with limited number of households includes improved seeds (6,500 households, 16%), herbicide 988 households presenting 5 percent of the total households growing crops in short rainy seasons. On the other hand, the highest percentage of households had no access to fungicides (99%) followed by those who had no access to herbicides (95%), and improved seeds (84%).

**Table 3.9: Number of households which Used Inputs during Short Rainy Season**

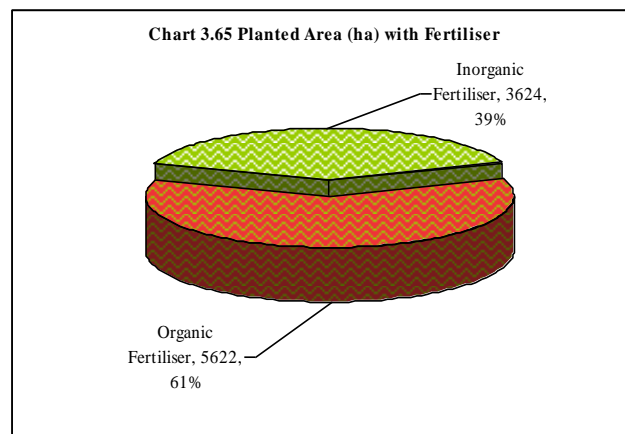

Type of input	Household with Access to input		Households without Access to input	
	Number	Percentage	Number	Percentage
Improved seeds	6,500	16	35020	84
Fungicide	508	1	41,012	99
Inorganic Fertilizer	2,899	14	18,111	86
Organic Fertilizer	7,502	18	34018	82
Herbicides	988	5	18,569	95

### 3.6.1 Use of Improved Seeds

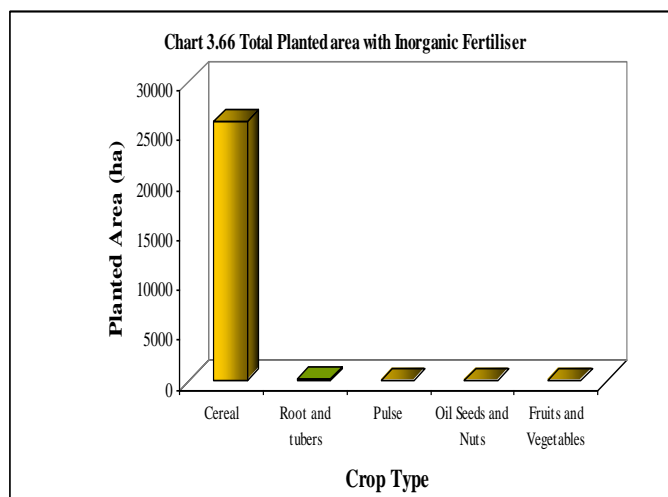

The total area planted with improved seeds was 3,874 ha (1,907 ha, 49% in short rainy season and 1,967ha, 51% in long rainy season). Cereals had the largest area planted with improved seeds accounting for 59 percent (2,272 ha) of the total area planted with improved seeds followed by fruits and vegetables (933 ha, 24%), cash crops mostly seaweed (304 ha, 8%), roots and tubers (227 ha, 6%), pulses (157 ha, 4%) (Charts 3.65 and 3.66).

### 3.6.2 Use of Fertilizer

The results presented in this section is based on the use and area application with fertilizer and not quantity applied. In the overall, the largest area was not planted with any type of fertilizer. This accounted for 85 percent (51,843 ha) of the area planted with crops. On the other hand, 15 percent was planted with fertilizer of which organic fertilizer was applied to 61 percent (5,622 ha) while the area applied with inorganic fertilizer accounted for only 39 percent (3,624 ha) (Chart 3.65).

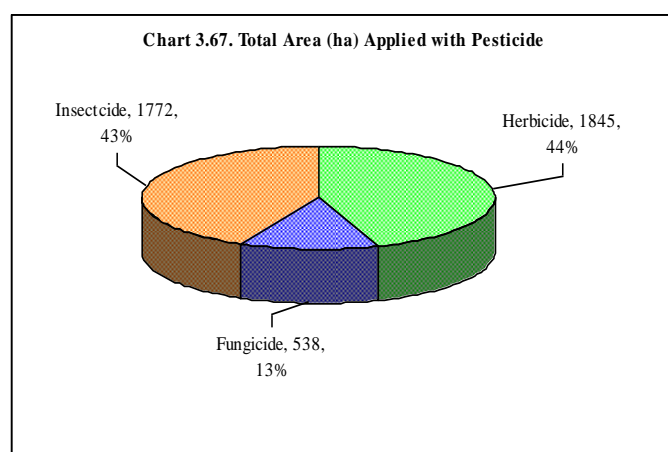

Regarding percentage of crop type planted area with inorganic fertilizers in the production of annual crops, cereals accounted for the largest planted area with inorganic fertilizer (26,103 ha, 99%), followed by root and tubers (141 ha, 1%), pulses (17 ha, 0.06%). On the other hand, cash crops, oil seeds and oil nuts were produced without use of inorganic fertilizer (Chart 3.66).

### 3.6.3 Use of Pesticides

Pesticides refer to chemicals which are used for controlling pests and diseases on crop

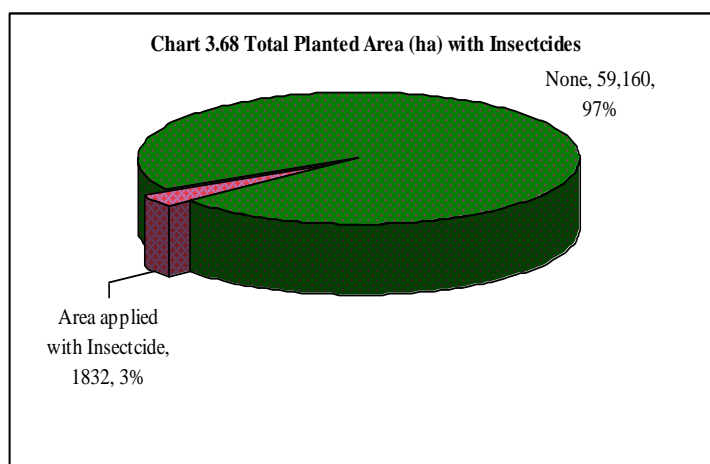

production. This section presents the use of various pesticides.

The largest area was planted with herbicides (1,845 ha, 44%) closely followed by insecticides (1,772 ha, 43%), and fungicide (538 ha, 13%) (Chart 3.69).

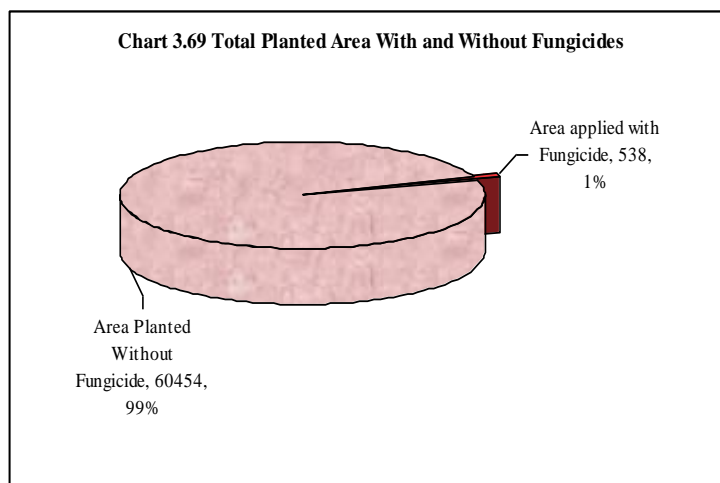

### Insecticide

Most of the area (59,160 ha planted with annual crops) was planted without using insecticides, representing 97 percent of the total land area planted with annual crops during short and long rainy seasons, while the input was used only on 3 percent (1,833 ha) (Chart 3.68).

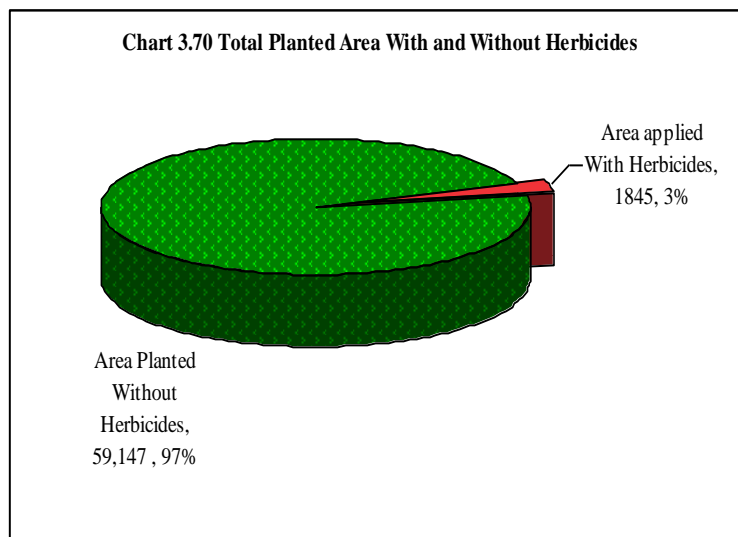

### Fungicide

The largest area (60,454 ha, 99%) was planted without using fungicides while only one percent (538 ha) was planted using fungicides (Chart 3.69). From the total area which applied fungicides, 67 percent was used during the short rainy season and 33 percent in long rainy season. The most dominant crop applied with fungicide was fruits and vegetables which accounted for 69 percent of the total area, followed by cereals with 19 percent. Fungicide was not used for oil seeds.

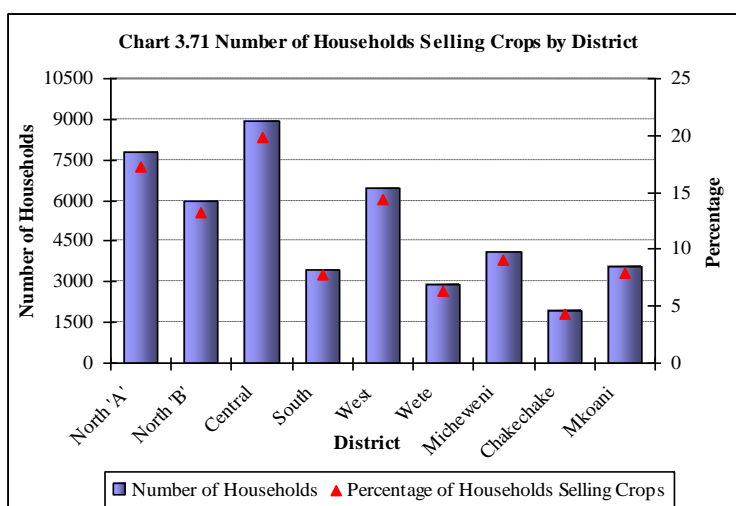

## Herbicides

Only 3 percent (1,845 ha) of the total area planted with annual crops was planted with herbicides while the rest, 97% (59,147ha) was not planted with herbicides (Chart 3.70). Most of the herbicides was applied during the long rainy season (1287ha, 70%). The dominant crop was paddy (1,282ha, 99.6%).

## 3.7 Crop Marketing

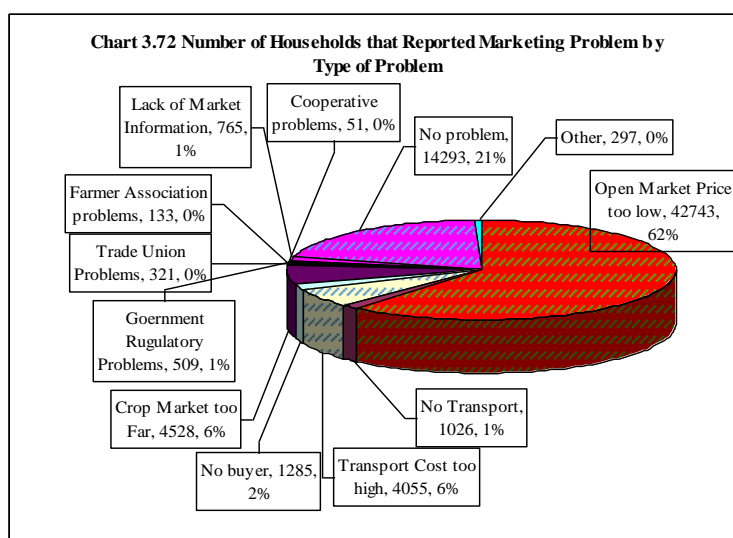

A total of 45,013 households reported selling crops (48 percent during short rainy season and 52 percent in short rainy season). The largest number of households that reported selling crops was recorded for Central District (8,907 households, 20%) followed by North 'A' (7,781 households, 17%) and West District (6,468 households, 14%).

In contrast, districts with the smallest number of households that reported selling crops were Chakechake (962 households, 4%) and Wete (2,870 households, 6%) (Chart 3.71).

### 3.7.1 Main Marketing Problems

Households faced various marketing problems. The most important problem faced by households in marketing their crops during short and long rainy seasons was open market price being too low (42,743 households, 62%) followed by crop market being far (4,528 households, 6.5%), transport

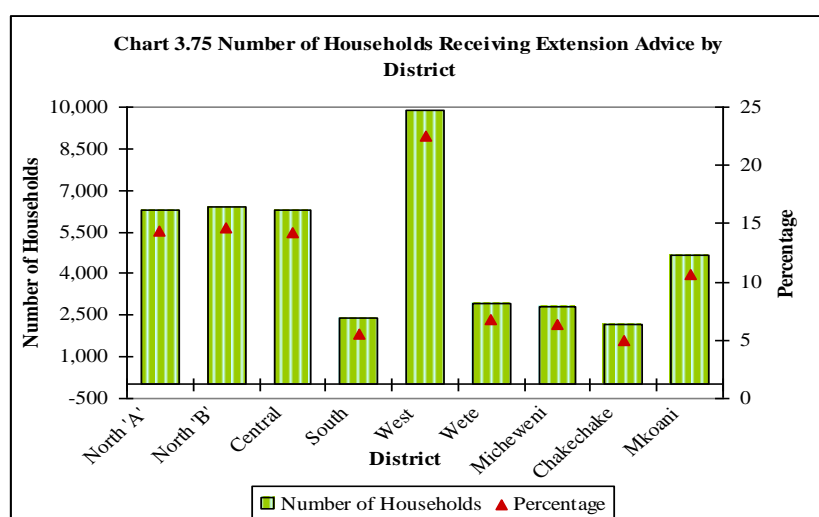

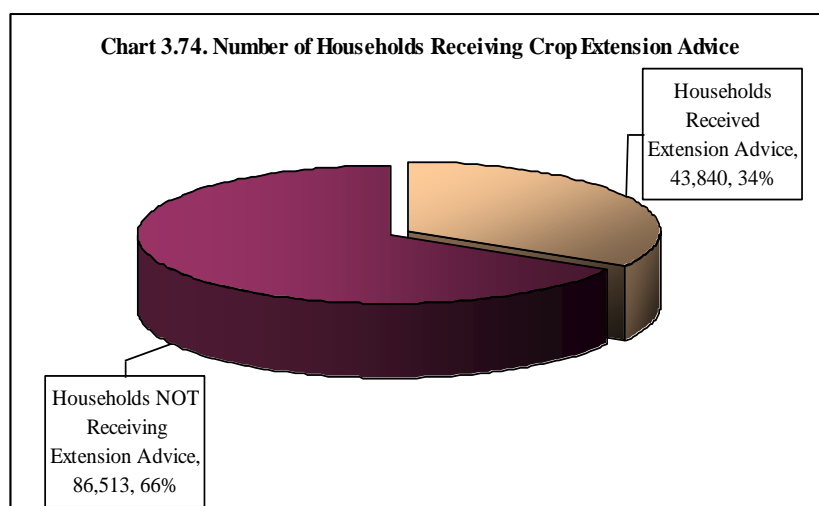

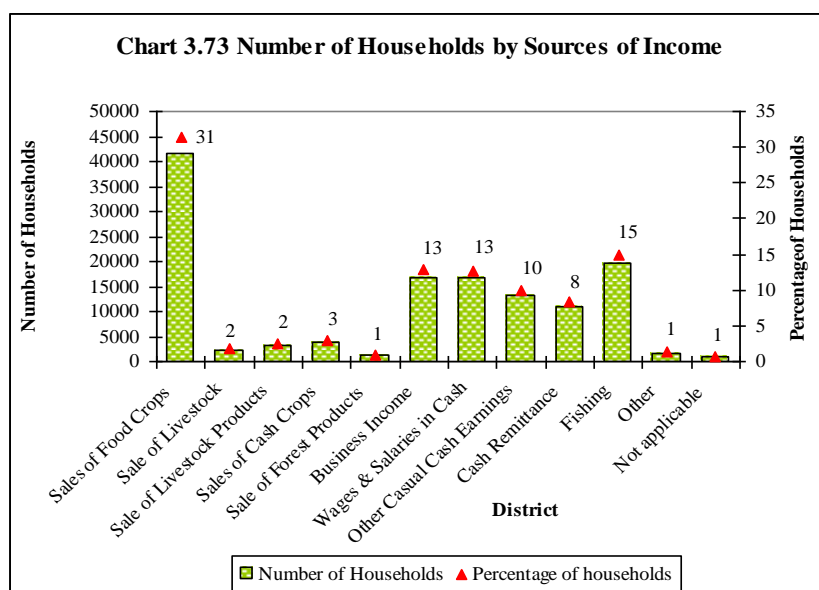

cost too high (4055 households, 5.8%). On the other hand, marketing problems were reported by a small proportion of households as follows: cooperative problems (51 households, 0.1%), farmer association problems (133 households, 0.2%) and trade union problems (321 households, 0.6%) (Chart 3.74).

### 3.8.1 Sources of Finance

Sale of food crops was the main source of household finances as it was reported by 31 percent of the households (41,491). The other sources in order of importance were fishing (19,744 households, 15%), wages and salaries (16,913 households, 13%), business income (16,913 households, 13%), and other casual cash earnings (13,082 households, 10%), (Chart 3.73).

### 3.8 Extension Services

Out of a total of 130,353 households, only 34 percent (43,840 households) received extension advice while the rest, 66 percent (86,513 households) did not receive any extension advice, (Chart 3.74). Of the total 43,840 households that reported to have received extension advice, the distribution by district is as shown in Chart 3.75.

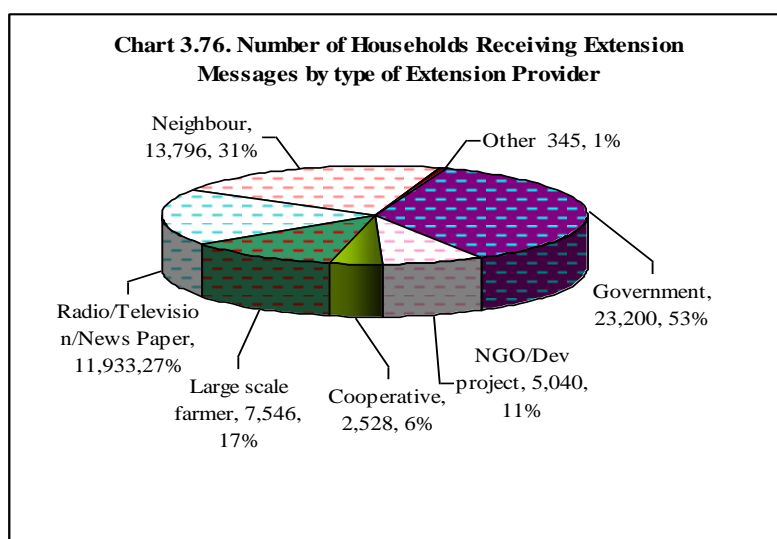

The largest number of households that received extension services was recorded in West district (9,891) followed by North 'B' district (6,413), North 'A' (6,269), and Central district (6,262). However, the smallest number of households was found in Chakechake district (2,193). On the basis of proportion of households that reported to have received extension advice, the three leading districts were North 'B' (57%), West (56%) and Central (46%). The lowest proportion of households that reported receiving extension advice was found in Chakechake (16%) and Micheweni districts (16%).

### Source of Extension Advice

The Government was the main source of extension advice to households as it was reported by 53 percent of the households that received crop extension advice, followed by neighbours which accounted for 31 percent.

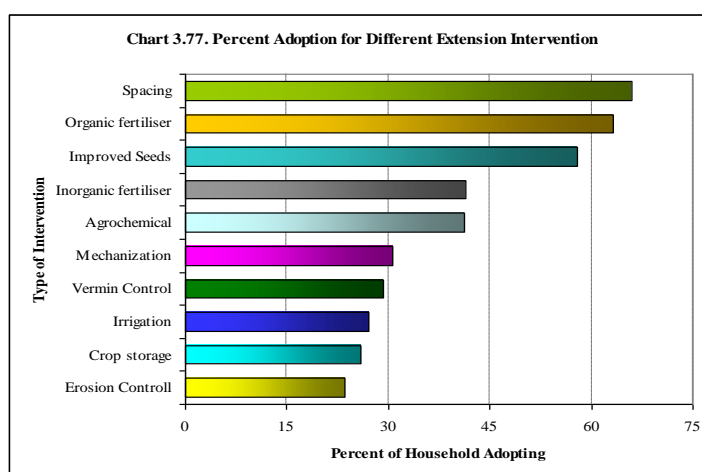

#### Radios/Televisions/Newspapers

were the third most important source of extension advice to 27 percent of the households which received extension advice, large scale farmers (17%), NGO/Development projects (11%), and cooperatives (6%) , (Chart 3.76).

### Adoption of Extension Interventions

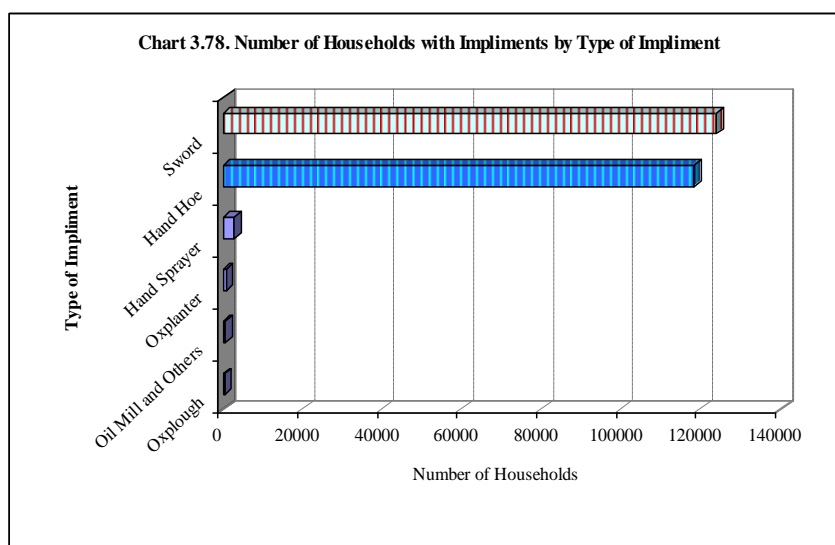

The three most adopted interventions by crop growing households were spacing (28,927 households,) representing 66 percent of the total households that received extension advice on crop production. The second was on the use of organic fertilizer (27,718 households, 63%) and improved seeds (25,400

households, 58%). Interventions that were less adopted were erosion control (10,364 households, 24%), crop storage (11,387 households, 26%), and irrigation (11,849 households, 27%) (Chart 3.77).

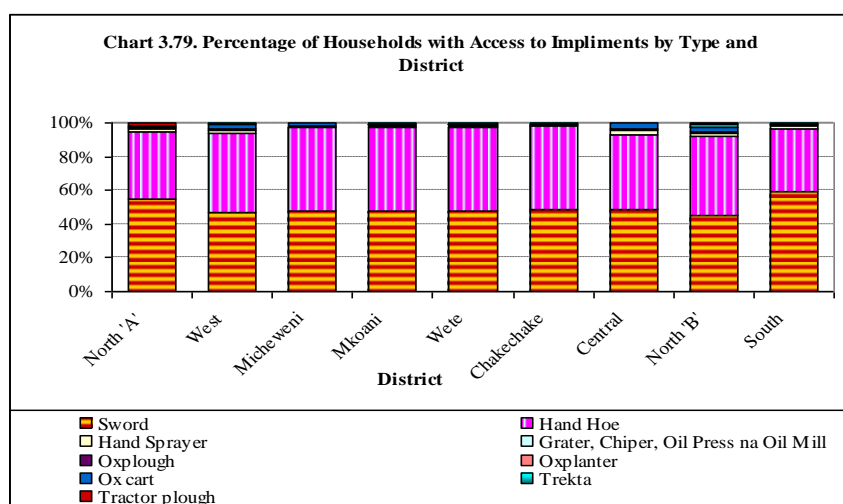

### 3.9 Household Implements

The sword and hand hoe were the two implements widely owned by agricultural households. While a total of 123,833 agricultural households owned swords representing 94 percent of the total agricultural households. The second was hand hoes which accounted for 118,358 households (90 percent

of the agricultural households) and hand sprayers were owned by 2,712 households representing only 2 percent of the agricultural households. On the other hand, the ridger was used by the smallest number of agricultural households (170 households) (Chart 3.78).

The distribution of ownership of the implements by district shows that, for all districts, the two most implements widely owned by households in all districts were the sword and hand hoe (Chart 3.79).

#### **4. CONCLUSIONS AND RECOMMENDATIONS**

This Chapter focuses on crop production with specific reference to planted area, use of inputs, marketing, farmer access to extension service, and crop markets. The Chapter is organized in three sections. In the first section the current status of agriculture in Zanzibar is described while the second section discusses the main findings of the agriculture sample census. Lastly, the third section presents district production profile.

##### **4.1 Current Status of Agriculture in Zanzibar**

The crop sector plays an important role in Zanzibar's economy by providing jobs, sustenance and income to 132,193 households (representing about 99 percent of the total agricultural households or 95 percent of the total rural households).

Crop production is the dominant holding type of agricultural activity in Zanzibar engaging 86,509 households (65%) compared to 43,844 households (33%) that engage in mixed crop and livestock, only 1,840 households (1%) are engage in livestock only.

The total planted area was 139,415 ha of which 60,922(44%) ha were planted with annual crops while 78,493ha(56%) were grown to permanent crops. Paddy was the most important crop followed by sweet potatoes, maize, and yams. Clove and seaweed were important cash crops and grown in all districts except in South District for clove. Mkoani, Wete, Micheweni and Chakechake districts accounted for more than 70 percent of the total area planted with cloves. Generally, there was limited investment in irrigation. Thus agricultural production is largely rainfed and hand hoe was the most important means of cultivation. Besides, there is limited use of external inputs such as fertilizer and pesticides. In fact, only 14 percent (2,899) of households had access to inorganic fertilizer during short rainy season while the rest, that is, 86 percent (18,111) of households had no access to this inputs in the same season. More specifically, the highest percent of households had access to improved seeds 6,500 (16%), organic fertilizer 7,502 (18%) households, As a result of limited use of these inputs crop yields were low compared to existing potential.

Access to extension advice was rather limited to crop growing households (130,353 households) with only 34 percent (43,840) households received extension advice while 66 percent (86,513) did not receive any extension advice.

A total of 45,013 households (35 percent of crop growing households) reported selling crops for short and long rainy seasons. The largest number of households that reported selling crops was recorded in Central District (8,907 households) followed by North 'A' (7,781 households) and West District (6,468 households). The main marketing problems was too low open market price reported by (42,743 households, 62%) followed by crop market being far (4,528 households, 6%), transport cost too high (4,055 households, 6%).

### **Important Issues**

This section discusses some of the findings in relation to the following issues:

- Use of inputs
- Access to land
- Increase in the number of smallholder households and land consolidation
- Irrigation
- Access to extension advice

#### **4.1.1 Use of inputs**

Generally, the use of inputs including improved seeds, inorganic and organic fertilizers varied across districts. Of these inputs, improved seeds were most widely used. However, a larger area is planted with local seeds than with improved seeds. Also, although the use of pesticides was rather limited most households used more insecticides, followed by herbicides than fungicides.

*Recommendation: Use of fertilizers and chemical inputs is critical for enhancing crop productivity under smallholder farming setting countrywide. Hence there is need to put in place mechanisms that will not only ensure their access by smallholders but their use as well.*

#### **4.1.2 Access to land**

There is scarcity of land for agriculture in Zanzibar. Moreover, smallholder farmers do not have sufficient land to produce food crops for sale to the local and external market and for their subsistence. This is evident as:

1. The average physical land per agricultural household was only 1.2 ha but more importantly some households had access to land that was much less than 1 hectare.

2. The percent of utilized land compared to available land was high and in some districts the planted land area was bigger than the available land suggesting the same piece of land was used to plant several crops in one agriculture year.

***Recommendation:***

There is need to carry out a study to determine the minimum area of land that is required for a smallholder household to meet its subsistence needs as well as the area required to have self sustaining profit making farms. This should then be used to promote adequate size profit making farms and provide start up capital and credit for inputs.

**4.1.3 Increase in the number of smallholder households and land consolidation**

Increase in the number of farming households coupled with small planted areas per household is likely to prevent reduction in rural poverty. Hence land consolidation is required to increase the area under production per household to the level whereby smallholder farms can become self sustaining economic entities.

***Recommendation:***

Land reforms policies should promote land consolidation without further expansion into virgin areas.

**4.1.4 Irrigation**

Only a small proportion of crop land is irrigated. Consequently, benefits of using productivity enhancing inputs such as improved seeds and fertilizer are not fully exploited.

*Recommendation: Efforts must be made to ensure expansion of irrigation facilities in order to ensure that majority of farmers have access to these facilities*

**Access to extension services**

In general, access to extension advice was limited. Public staff provided the main source of extension advice. Wider promotion of improved technologies for enhancing crop productivity is, to some extent, dependent on an effective extension system whose services are accessible to its clientele.

*Recommendation:* Efforts should be made to ensure that extension advice is provided to the majority of smallholders who currently don't have access as well as *improve the quality of its services to ensure increased adoption of improved practices for increased crop productivity.*

## **4.2 District Profiles**

### **4.2.1 North 'A'**

North 'A' had the first largest number of households (16,318) growing crops only and the second highest percent of households (17%) with planted area in the short rainy season and the third highest percent of area (14%) planted in the long rainy season. Moreover, the district had the fourth highest percent (10%) area planted with permanent crops. Also, it was one of the seven districts with less than 50% of households, which reported having access to extension advice.

North 'A' had the second largest overall number of households (7,781) that reported selling crops after Central District (8,907 households).

### **4.2.2 North 'B'**

North 'B' had the first highest percent of utilized land (99.62%) and the second highest percent of households reporting land insufficiency (67.8%). Also, the district had the third highest percent (13%) of area planted during the short rainy season and seventh highest percentage (8%) of area planted in the long rainy season. Moreover, it had one of the smallest area under pasture (5 ha) and one of the districts with the lowest percent (9%) of total area planted with permanent crops. Specifically, it recorded the second highest percent (17%) of area planted with coconuts and the third largest area under irrigation (348 ha) and percent of irrigated land (13%).

Of all districts, North 'B' recorded the first highest percent (57%) of households reporting access to extension advice within the district.

### **4.2.3 Central**

The three leading districts both in terms of percent of area planted and average planted area per household with permanent crops were Wete (14.4%, 0.78 ha); Central (14.1%, 0.91 ha), and Mkoanil (14%, 0.69 ha).

Central district had the third highest percent of the total area planted with banana as well as average planted area per household planted with the crop. The district recorded the first highest percent (19 %) of the total area planted with coconuts followed by North 'B' (17%) and West and Wete districts (16%).

Central district accounted for almost over a third (37%) of the area planted with mangoes while about 50 percent (48.3%) of the area planted with oranges was recorded in the district. Also, the district accounted for 51 percent of the total area planted with sugar cane followed by Micheweni (18%).

The district recorded the second highest percent of irrigated land (757 ha, 27%) and the second largest number of households practising irrigation.

The largest number of households reported selling crops was recorded in Central district (8,907 households) followed by North 'A' (7,781 households, 17%) and West district (6,468 households, 14%).

#### **4.2.4 South**

The district had one of the highest percent (88%) of agricultural households that reported all land available to the household was used to cultivate crops. and also was one of the lowest percent (24.4%) of households reporting land insufficiency. Also, it had the moderate percent (20%) of household growing crops in the short rainy season and the area planted during the long rainy season was only 13% within the district. The area planted with permanent crops was only 4% - one of the lowest percent in Zanzibar. Moreover, South district is the only district in Zanzibar where no clove production was recorded and had the lowest percent (2%) of the irrigated land.

The district recorded the moderate percent (8%) of households selling crops while at the same time it had less than 50% of households had access to extension advice.

#### **4.2.5 West**

West district had the fifth highest percent (11.4%) of area planted with permanent crops and the third highest percent (16%) of the area planted with coconuts. The district had the largest number of households practising irrigation (2,072, 11%) and the largest irrigated area (479 ha; 17%) in the

long rainy season. Also, it recorded the second highest percent (56%) of households having access to extension advice.

#### **4.2.6 Wete**

Wete District recorded the fourth highest percent (95%) of land utilization and about 51 percent of the households reported land insufficiency. It had the highest percent (14.4%) of the area planted with permanent crops.

Moreover, the district had the third highest percent (89.2%) of area planted during the long rainy season and the third lowest percent (10.7%) of area planted in the short rainy season. It recorded the third highest percent (16%) of total area planted with coconuts; the highest percent planted with orange (48.2%), and the second lowest percentage of area planted with clove (5.8%). In terms of irrigation, the district had the smallest land area under irrigation (131 ha) in the short and long rainy season. In addition, the district recorded the second lowest percent (19%) of households reporting access to extension

#### **4.2.7 Micheweni**

Micheweni recorded the third largest number of households (9,899) growing crops only and those keeping livestock only (146), and the first largest number of households engaged in both crops and livestock (7,475). In land utilization it was the fourth highest (95%) and only 54.8% of households reported land insufficiency.

The second largest area (6,222 ha) under permanent mono crops was recorded in the district. Also, it had the second highest percent (18%) of the total area planted with sugar cane. However, Micheweni recorded the fourth smallest areas (24 ha) planted with trees.

Of the total irrigated land, Micheweni recorded only 7% of irrigated land (201 ha) in the short and long rainy seasons

---

Furthermore, only 16% of the households had access to extension services

#### **4.2.8 Chakechake**

Chakechake recorded 98 percent of land utilization while only 46.4% households reported land insufficiency. The District accounted to about 34 percent of land planted with cereals. Moreover, it had the second highest percent of the total area planted with banana (14.7%) as well as average planted area (0.3) per banana growing household. Chakechake accounted for 16 percent of the total area planted with cloves.

#### **4.2.9 Mkoani**

Mkoani had the first highest percent of total planted area with permanent crops (21%). It also had the highest average planted area with permanent crops per household (0.31 ha). Mkoani had the highest percent(20%) of the total area planted with banana as well as average planted area (0.3) per banana growing households.

Of the total area under irrigation Mkoani accounted for only 6% (180 ha) - one of the districts with lowest area under irrigation. Also, only 38 percent (1781 households) reported selling crops and ranked sixth (29%, 4,641 households) in terms of households having access to extension

## Definition and working page for page 1

### General Definitions

Who is a Smallholder /Small Scale farmer?

Should have one or more of the following: in the 2007/08 farming season had one or more cultivated and planted farms. The farm land may either be owned, rented, borrowed. The farmer may also be raising 1 and 50 head of cattle, and/or between 5 and 100 head of sheep/Goats/Pigs, and/or between 50 and 1000

**Household:** A group of people who occupy the whole or part one or more housing units and makes joint provision for food and/or other household items. Usually such a group comprises a husband, wife, and their children. Other relatives may be members of the household if they happen to live and get food provisions from the same household. People who live together and eat from the same pot may be considered as members of the same household even if they stay in separate dwellings. An individual who lives and eat alone is considered as an independent household.

**Household Head:** A person who is acknowledged by all other members of the household either by virtue of his age or standing in the household as the head. He/she should be a permanent resident of the house and he/she is the main person responsible for decision making regarding use of household resources..

**Agricultural Holding:** This is an economic unit of agricultural production under single management. This unit may have been grown various crops. For the purpose of the survey, the agricultural holdings are restricted to those which meet one of the following conditions:

- Having or operated at least 25 sq meter of arable land
- Own or keep at least one head of cattle or five goats/sheep/five pigs or fifty chicken/ducks/turkeys during the agricultural year 2007/08 (from October 2007 to September 2008).

### Question Specific Definitions:

#### Type of Agriculture holding Codes (Q2.1):

**Crops only:** A holding is referred to be a crop only holding if it has cultivated at least one piece of land. This also applies to all households owning or have kept livestock whose number does not qualify such households to be an agricultural holding (No cattle, less than 5 goats/sheep/pigs, less than 50 chickens/turkeys/rabbits).

**Livestock only:** A holding is referred to be a livestock only holding if it has exercised livestock husbandry only during the 2007/08 agricultural year.

#### NOTE

For agricultural holding only and pastoralist holding only; the number of livestock should be at least one head of cattle, not less than five goats/sheep/pigs, not less than 50 chickens /turkeys /rabbits. This also applies to households having or operated less than 25 sq meter of cultivated land (which does not qualify the household to be considered as agricultural holding) but has the number of livestock that makes the holding qualifies to be considered as livestock holding.

**Pastoralist holding:** This refers to a household which practices livestock production as its major income generating activity and a means of subsistence, but moves from one place to another searching for water and pasture for the livestock. This movement usually involves long distances and in many cases the whole household unit moves with the livestock and they have no permanent place of residence.

**Both crops and livestock:** A holding is referred to be a both crops and livestock if it has cultivated a piece of land equal or exceeding 25 sq meter and if such households have own or kept livestock whose number qualify such household be considered as an agricultural holding.

### Procedures for questions:

#### Q 2.1 Type of agriculture household/holding

Using the options under the question classify the type of agriculture household/holding

Note: If the household had an acre of crops and raised 40 chickens during 2007/08, it is classified as 'Crops only' as the number of chickens does not qualify the household as a livestock holding.

**Definition and working page for page 2**
**Question Specific Definitions:**
**Relation to head (Col 2):**

**Household Head:** A person who is acknowledged by all other members of the household either by virtue of their age or standing as the household head.

**Read and Write (Col 8)**
**Any other language: Must be a written language.**

For someone who can read and write in Kiswahili and any other language apart from English, the correct code is 1. For one who can read and write in English and any other language apart from Kiswahili the correct code is 2. Code 4 should only be used for any other language which is not English or Kiswahili.

**Education Level Reached (Col 10):**

Ask the respondent the highest educational level reached. This aims at establishing whether at the time of enumeration the member of the household is studying has completed or has never studied. Make further enquiry for the level of education reached for those who have completed studies. Establish if the member had attained any training after graduation for the purposes for completing column number 9. For those who still continue attending studies during the period of this survey, establish their learning stage. For instance for a household member who studied up to Standard Three but did not complete his/her education at this level, then his/her highest education level reached is Standard Two. For those indicated under code 3 (not studied) in column 8 should be marked code 99 (Not applicable) in column 9.

**Section 3.0 Note**

Make sure that you define the hh proper to ensure that all the members of the hh are included. Ensure that you stress that the hh is not just the hh heads direct family and that it includes other people living and eating together with the family.

If you notice that the hh is large or you see many people around the hh and you have been given a smaller number of the hh members, make further enquiries until you are sure that you have captured all the hh members.

**Section 3.0 Household information.**

- ii) For each household member complete columns 1, 2, 3 and 3  
After completing columns 1, 2, 3 and 3 for each household member, go back to the first household member and complete the remaining columns for that member.
- iii) Repeat step 2 for the rest of the household members.

 Student .....14  
 Unable to work too old, too young, retired, disabled, child 15  
 Others (specify) .....98

## Definitions and working page for page 3

## Definitions for Key Specific Questions

## Section 4.1 – Land Access/Ownership

These are areas that were used by the households for the 2007/08 farming season

**Lease/Certificate of Ownership:** Area under lease/certificate of ownership refers to the areas which were issued by the government. The household possesses government issued leasehold title or certificate of ownership. The land will normally be officially surveyed and boundaries marked. This includes leased land bought from others where the lease/certificate of ownership has been transferred.

**Customary Law:** This refers to the land which the household does not have an official government but its right of use is granted by the traditional leaders.

**Bought:** This refers to the areas of customary land that has been bought from others. This land does not have an official title and therefore is not leasehold.

**Rented from others:** Land rented from others for cash or for a fixed amount in crop produce (e.g. fixed number of bags at harvest).

**Borrowed:** use granted by land owner free of charge. Land owner can either be a lease holder or has right of access through customary law.

**Share cropping:** where the household is permitted to use land which is then paid for from a percentage of the harvested crop

## Section 4.2 Land Use

Temporary crops: are sown and harvested during the same agricultural year

Permanent crops: are crops once sown or planted last for some years and need not to be replanted after each annual harvest.

Permanent crops /mixed crops: This is a mixture of permanent and seasonal crops. The two crops can either be randomly planted together or in a particular pattern e; for example intercropping (1 row of maize and 1 row of beans). A field that has been divided into plots for different crops is not mixed).

This is further subdivided into:

Mixture of Permanent crops – two or more permanent crops grown together

Mixture of Permanent and Temporary crops – permanent crop and annual crop together

Mixture of Temporary crops– two or more temporary, annual crops grown together

**Pasture land:** this is an area of owned/allocated land which is set aside for livestock grazing. It can be improved pasture where the farmer has planted grass, applied fertilized or where other means have been applied to improve the pasture. Or it can be natural pasture.

**Natural Bush:** Land which has naturally grown shrubs and trees and is considered productive but is not utilized for farming or livestock production.

## Overview to section 4

## Overview to section 4

## Section 4.0: Preliminary note

## Land Access/Ownership

Land access/ownership refers to the area utilized by the members of the household. This does not include communal land where the resources are shared between household members. It does not include official communal land that the household has sole access to for example a plot for crop farming in the communal area.

## Procedures for questions

## Section 4.0 – Land Ownership

1. Ask the respondent if he knows the total areas of land the household has sole access to. If he knows make a note in the calculation space
2. Ask the respondent the area of the different land ownership categories the household has sole access to (Q4.1, 1 to 4.1.7) and record in the appropriate spaces.
3. Add up the area of the different categories of land and compare it with the total area obtained in step 1 (if the respondent provided the information)
4. If the total area is different find out which one is correct and make

## Section 4.2: Land Use

1. Ask the respondent the area of the different land use categories the household has sole access to (Q4.2.1 to 4.2.12) and record in the appropriate spaces.
2. Add up the area of the different categories of land and compare it with the total area obtained in section 4.0. The total area should be the same.
3. If the total area is different find out which one is correct and make amendments where appropriate.

## Instructions for calculating the area of mixed crops in a mixture

- A.** If the mixed crop is mixed annual ly only enter the total area of the field in the remaining are temporary Crop and go to step one of these instructions.
- B.** If the mixed crop is mixed permanent and annual try to work tyhe percent age taken by the c and calculate the area of annual crops outlined in step 1. Otherwise use the number of trees met the area of annula crops in the mix.
- C:** Number of trees method to calculate annual crop areas in a permanent-annual crop mix:
- List each of the permanent crop in column b and enter the ground area per acre for each p ( from instructions for page 8) in colum d.
  - Enter the number of permanent trees in the mix in column e as will be provided to you b respondent
  - Calculate the area occupied by each crop by multiplying column d and column e and sum obatin the total area of permanent crops in the mix.
  - To obtain the area for temporary crops , subtract (-) the area fro permanent crops from th crop mix and enter the result in in the total area under temporary crops.
  - Proceed to step 1 to calculate the area under each temporary crop.
- 1.** Enter the name of each temporary crop in tyhe crop mix and estimate percentages of each c
- 2. Using the percentage for each crop, calculate the are for each crop from the remaini temporary crop.**
- 3.** After completing the excrise for all the fields, sum the area of each crop in tyhe mix plus any uenter the totals in section 5.1.1 Column 3.
- 4. Once the quantity harvested is obtained , caklculate the yields (metric tonnes/acre) a the figures with the norms given in the crops code box. If there is significantly difference, ch and the amount harvested..**

**Instructions for calculating the area of mixed crops in a mixture**

- If the mixed crop is mixed annual ly only enter the total area of the field in the remaining area under temporary Crop and go to step one of these instructions
  - If the mixed crop is mixed permanent and annual try to work tyhe percent age taken by the different crops and calculate the area of annual crops outlined in step 1. Otherwise use the number of trees method to calculate the area of annula crops in the mix.
- C:** Number of trees method to calculate annual crop areas in a permanent-annual crop mix.:
- List each of tyhe permanent crop in collumn b and enter the ground area per acre for each permanent crop ( from instructions for page 8) in collumn d.
  - Enter the number of permanent trees in the mix in collumn e as will be provided to you by the respondent.
  - Calculate the area occupied by each crop by multiplying collumn d and collumn e and sum up these to obatin the total area of permanent crops in the mix.
  - To obatin the area for temporary crops , subtract (-) the area fro permanent crops from thne total area of crop mix and enter the result in in the total area under temporary crops.
  - Proceed to step 1 to calculate the area under each temporary crop.
- Enter the name of each temporary crop in tyhe crop mix and estimate percentages of each crop.
  - Using the percentage for each crop, calculate the are for each crop from the remaining area under temporary crop.**
  - After completing the excrise for all the fields, sum the area of each crop in tyhe mix plus any monocrops and uenter the totals in section 5.1.1 Collumn 3.
  - Once the quantity harvested is obtained , caklculate the yields (metric tonnes/acre) and compare the figures with the norms given in the crops code box.** If there is significantly difference, check the area and the amount harvested..

**Storage (Col. 30, Q 5.2.1):**

- **Traditionally Made structures:** The design of storage structures villagers have inherited from forefathers .
- **Improved Traditionally made structures:** The design of traditional storagesrutures improved through modern technology.

**Marketing Challenges Q 5.2.1 Col. 33:**

- **Farmers' Association:** Village farmers who came together and started an association for the puporses of purchasing inputs/selling/storage of crops aiming at fetching better prices.
- **Cooperative Union:** A large inter-village/community set up in the district/ region or at national level for providing inputs, markets and storage of farmers' crops.
- **Government Regulatory laws for crops marketing:** Government instituted laws for regulatina transportation and selling of crops.

**Inputs (Q 5.2.1)**

- Farm Yard Manure:** An organics fertiliser made on farm from animal dung. .
- Compost:** An organic fertiliser made on farm from decomposed plant materials.
- Insecticides:** This is the chemical usde in protecting plants or killing pests.
- Fungicides:** Protects plants from fungi attack.
- Herbicide:** Chemicals used to control or kills weeds.
- Improved seeds:** Scientifically attested to be suitable for agricultural use.

## Questions specific definitions

**Q 5.2.1. Instructions on crops storage:**

1. For the listed crops establish whether or not the household stored crops for 2007/2008 agricultural season.
2. For the listed crops give explanations on storage.

**Crops storage is keeping/reserving crops in a container or a special place for future use.**

**Q 5.2.1 Col 33**

1. For each of crops listed indicate major marketing problems for 2007/2008 agricultural season.

**Working area/calculation space**

## Definitions and working page for page 8

**Permanent Crops:**

These are crops once planted last longer in the farm and need not be replanted after each annual harvest. Most of the permanent plants include tress such as coconut tress, apple trees, grape trees, banana trees, pineapple trees etc.

**Number of Trees:**

These include manure trees and premature trees.

**Number of mature plants:**

A total of fruit bearing tress (e.g. mango trees, orange trees, avocado trees e.t.c).

**Instructions for permanent monocrops and crop mix:**

- A.** For a field with permanent monocrop enter farm size in collumn. 3.  
**B.** For a field with a permanent crop mix or a temporary crop mix, enter the number of trees only in collumn 4.  
**C.** For a field with a permanent crop mix /temporary annual crops , either:  
 -Enter the area in collumn 4, if the total arae for permanent crops was obtainted through calcuatlion of percentages of each crop  
 OR  
 Enter the number of tree in collumn 5, if the number of plants/ seedlings of permanent crops was included

**21 Cassava:** Cassava is a temporary crop, in order to simplify data collection on areas of production, data on cassava will be collected from areas under permanent crops.

## Questions specific definitions

**Q 5.3.1. Instructions on crops storage:**

1. For the listed crops establish whether or not the household stored crops for 2007/2008 agricultural season.
2. For the listed crops give explanations on storage.

**Q 5.3.1 Col 35**

1. For each of crops listed indicate major marketing problems for 2007/2008 agricultural season.

**Working area/calculation space**

### Definitions and working page for page 10

#### Investment in agriculture

##### Investment activities:

Investment activities refer to medium to long term farm development structures and projects. This can be irrigation structures, erosion control and water harvesting structures or other permanent or semi-permanent investment made on the land that the household owns.

#### Irrigated farming: Section 6.5:

**Source of irrigation water** (Col 1): The main source of the water used for irrigation.

**Method of obtaining water** (Col 2): The mechanism by which the water is extracted from the source

**Irrigatable area** (Col 3): The area the irrigation system is designed to cover in acreage

Area of irrigated land during the 2007/08 (Col 5): Area of land under irrigation during the 2007/08 agricultural year. This is the actual area and NOT the cumulative areas recultivated in 2 or more cropping seasons.

#### Q 6.5 Irrigation.

1. If a household uses irrigated farming give explanations on source and method of obtaining water. .

2. See Col 10, Q. 5.1.1 and 5.2.1 and Col 12, Q 5.3.1 to see if irrigation was applied to any crop.

#### Farm implements, Q 6.1:

1. Column 2 Indicate whether or not inputs were used

2. Complete column 3 by entering the number of inputs used.

#### Farm Implements (Col. 1):

**Machette** : Include all implements use in tree cutting namely cicle, etc.

**Sprinkler**: The pump carried on the back or a hand used water pump

**Hand used small tractor**: A small tractor used in cultivation while the user walks on foot (see photo).

#### Section 6.2 Use of draft animals

Animals used in agricultural activities by the household during 2007/08 agricultural season.

**Castrated Bulls**: Castrated oxen meant for use in agricultural production.

**Uncastrated Bulls**: mature bulls used for garicultural activities but are not castrated.

**Cow**: Farmers also use mature female cattle in agricultural activities due to shortage of bulls

**Donkey**: Mature Male or female donekys are also used for agricultural production.

#### Farm inputs: Sections 6.3 and 6.4

1. Column 2 Indicate whether or not inputs were used.

2. Compelte column 3 by indicating where the inouts were obatined and collumn 4 by indicating the distance from where the inputs were obatined

**Compost**: An organic fertiliser made on farm from decomposed plant materials.

**Insecticides**: This is the chemical usde in protecting plants or killing pests.

**Fungicides**: Protects plants from fungi attack.

**Herbicide**: Chemicals used to control or kills weeds.

**Improved seeds**: Scientifically attested to be suitable for agricultural use.

## Definitions and working page for page 11

## Q 6.6

**The type of erosion control/Water harvesting (Col 1)**

**Terraces:** Structures constructed on mountain slopes to provide flat terrain for crop planting.

**Erosion control bunds: these are bunks of earth/stones built perpendicular to the slope** to slow down the speed of water and thus preventing soil erosion. Its differs from terraces in that the soils on these banks are not at ground level .

**Gabions:** A box like structure made of wire and filled with large stones to prevent gully erosion.

**Sand bags:** Are used in controlling and preventing gully erosion  
**Tree belt/wind breaks:** Trees planted against the wind direction for breaking wind speed..

**Section 7.0 Acces to credit for crop or livestock production**

Credit refers to something provided in cash or in kind (such as farm inputs, machines, livestock and other things) for crop or livestock production. The value of the credit must be repaid back to the lender. An Interest may or may not be attached to the value of the credit

The credit may be repaid either in cash or through farm produce to be harvested .

In this question the enumerator is at liberty to inquire up to three sources of credit where the farmer accessed credit from more than one source.

**Section 8.0 Agricultural Extension Services**

**Agricultural Extension Services:** Refers to educational services provided to farmers by extension officers for the purposes of increasing crop and livestock production.

**Share-cropping:** Refers to farming where smallholder / Smallscale farmer enters into an agreement with large scale farmer where the former sells produce to the latter in exchange of provisions of farm inputs and the like. .

**Contract farming Farming:** Farming agreement entered between smallscale and large scale farmers with regards to markets of farm produce and provision of farm inputs

**Q 6.6 Number of water harvesting structures and year of construction**

1. The number water harvesting structures refers to the number of working / maintained structures and does not include derelict or irreparable structures.

2. Year of construction refers to the year in which the structures were built, and not the year the structures were last repaired. The year should be written in figures e.g. 1998, 2006.

**Section 7.0 Source of agriculture credit**

If the farmer obtained credit from more than one source the use the code from the list provided. Start with the main source of credit in Section "7.1.1".a

**Section 8.0 Agricultural extension services**

1. Ask if the household did receive agricultural extension services during 2007/08 agricultural season from the respondents listed in column 1, then enter column 2.

2. Complete all columns for every extension officer.

### Definitions and working page for page 12

**Q 9.1 and 9.3 :** What is required is to establish whether or not the household kept or raised the listed livestock during 2007/08 agricultural season (i.e. from October 2007 to September 2008). Also to establish the number of livestock as of 1st October 2008

**Keeping or raising livestock** is to to keep livestock at home while providing the livestock with animal feeds and medication and other services. The livestock could be owned by the farmer or kept on behalf of relatives or neighbours .

### Sections 9.1.1 to 9.1.7 Cattle

**Note:**

**Q 9.1 is for the actual number of cattle owned or kept by the household (as of 1st October 2008). This number does not include herds of cattle kept on behalf by relatives or neighbours; that is, the cattle outside the residential area of the household under survey.**

1. If the the household keep mature fecund female cattle, it is expected that such a household will have calves which will be entered in question 9.1.6 or 9.1.7

### Type of cattle (section 9.1.1 to 9.1.7)

**Bull:** Mature uncastrated male cattle used for breeding

**Cow:** Mature female cattle that has given birth at least once

**Ox:** Castrated male cattle used for farm work

**Steer:** Castrated male cattle used for meat

**Heifer:** Female cattle of 1 year up to the first calving

### Section 9.3 Goat

**Note:**

**Question 9.3 is for the actual number of owned or raised by the household (as of 1st October 2008) This number does not include goats kept on behalf by relatives or neighbours, that is the goat outside the residential area of the household under survey.**

1. If the household has she goats, you would normally expect them to have kids

### Type of Goat (Qs 9.3.1 to 9.3.5)

**Billy Goat (he-goat):** Mature Uncastrated male goat used for breeding

**Castrated goat:** Male goat that has been castrated

**She Goat:** Mature female goat over 9 months of age

**Definitions and working page for page 14****Control of livestock diseases causing bugs**

**Livestock worm control medicine:** Medicine used to kill or control livestock on livestock . It is often used for cattle, goats, sheep and pigs.

**Tiick:** Is a dangerous bug that sucks blood form livestock and transmits animals diseases from one to the other animal.

**Tse tse fly:** A fly like bug that sucks blood from livetsock and transmits diseases sleewping sickness from one to the other animal.

**Livestock advice (Section 9.8)**

IA service provided by extension officers to livestock keepers for increasing livestock production.

9.7 LIVESTOCK DISEASES AND PEST CONTROL		Identification	
Did you livestock during 2007/08 agriculture year? (Yes=1, No=2) (If the answer is No proceed to Section 9.7.5)		<input type="checkbox"/>	
Which animals did your deworm? (Yes=1, No=2, Not applicable=3 in the relevant box)		<input type="checkbox"/>	
9.7.1 Cattle <input type="checkbox"/>	9.7.2 Goat/Sheep <input type="checkbox"/>	9.7.3 Pigs <input type="checkbox"/>	
9.7.4 Poultry <input type="checkbox"/>		<input type="checkbox"/>	
9.7.5 Do you experience tick problem with your livestock? (Yes =1, No = 2, Not applicable 3)		<input type="checkbox"/>	
9.7.6 How did you control tick problem? Control method (Q. 9.7.6): Dipping.....1 Spaying.....2 Application of medicine on back bone.....3 None.....4 Other.....8		<input type="checkbox"/>	
9.7.7 Do you experience Tse tse problem with your livestock? (Yes =1, No = 2, Not applicable 3)		<input type="checkbox"/>	
9.7.8 How did you control Tse tse problem with your livestock? Control method (Q. 9.7.8): Dipping.....1 Spaying.....2 Traps.....3 None.....4 Other.....8		<input type="checkbox"/>	
9.7.9 Do you experience Newcastle disease problem with your poultry? (Yes =1, No = 2, Not applicable 3)		<input type="checkbox"/>	
9.7.10 How do you control Newcastle disease problem with your poultry? Control/curative methods (Q. 9.7.10) Vaccination.....1 Herbs.....2 None.....3		<input type="checkbox"/>	
9.7.11 Did you experience Fowl Typhoid with your poultry? Yes=1, No=2, Not applicable=3		<input type="checkbox"/>	
9.7.12 How did you control/ cure Fowl Typhoid with your poultry? Control/curative methods (Swall 9.7.12) Vaccination.....1 Herbs.....2 None.....3		<input type="checkbox"/>	
9.7.13 Were your cattle vaccinated against the following diseases? (Yes = 1, No = 2, Not applicable=3). 9.7.13 A: Foot and Mouth diseases <input type="checkbox"/> 9.7.13B: Skin disease <input type="checkbox"/>		<input type="checkbox"/>	
<b>9.8 Extension services on livestock</b> Did you receive the following extension advice on the following? (If the answer is NO in COL 2 PROCEED TO THE FOLLOWING QUESTION)			
Na.	Livestock extension advice	Received Extension advice (Yes=1, No=2)	Source of Extension
(1)	(2)	(3)	
9.8.1	Feed and better feeding methods	<input type="checkbox"/>	<input type="checkbox"/>
9.8.2	Improved livestock shed (Goat, Dairy cattle, Poultry and pigs)	<input type="checkbox"/>	<input type="checkbox"/>

NOTE : If answers to Qs 9.1 to 9.6 is No (THAT IS THE HOUSEHOLD DOES NOT RAISE LIVESTOCK) Proceed to q 9.9

### Definitions and working page for page 15

#### General definitions

**Fish farming:** Refers to the rearing/production of fish. It is different from fishing in that in fish farming the fish have to be reared. While in fishing, fishing nets or traps are used to catch fish from rivers, lakes and the sea; thus fishing should not be included in this section

I

#### Question Specific Definitions (Q 9.9)

**Production unit number (Col 1):** A production unit is a pond river/lake which is treated as a separate entity for the production of fish eg it may be by virtue of manageable size, maturity of fish, type of fish etc. eg. a farmer may have 3 fish ponds (each one is a separate production unit).

**Frequency of stocking (Col . 5):** What is the number of time the farmer puts new fingerlings into the pond each year.

**Fingerlings:** These are young immature fish used for stocking ponds.

**Sols: (Col 10 & 11)**

If no fish were sold enter "0" in column 10 and 11

#### Fish sold (Col.12)

Kama hakuna samaki waliouzwa jaza "0" katika safuwima 12

 23 Pests and diseases  
 24 Advice from Local government  
 25 Long dry spells  
 26 Conflicts between livetsock keepera and pastoralists

**Definitions and working page for page 16****10.0 Household poverty indicators****Number of rooms used for sleeping in the household (Q 10.1.4)**

Include sitting room, dining room, kitchen, etc if used for sleeping.

It also includes rooms outside the main dwelling

A room is defined as a space which is separate from the rest of the building by a permanent wall or division. A building / house that is not divided into rooms is considered to have one room.

**Household assets (Q 10.2):**

These assets must be functional. Do not include if broken.

**Access to drinking water (Q 10.4):**

If there is more than one source use the one, which the hh uses most frequently.

**Main source of hh cash income:(Q 10.7:**

Activity that provides the hh with the most cash during 2007/08 agricultural season.

## Definitions and working page for page 3

## Question Specific Definitions:

Obtain answers to the following questions from the meeting between the enumerator and influential farmers in the village. Influential people can be Village Chairman, Village Government Executive Officer, Councillor, Ward Chairman, Extension Officer in the village or any other person in the village and who is well informed about village matters. It is important to not that these questions must be asked in groups (of more than one people) to obtain answers discussed and approved by many people.

## Definitions of some specific terms

**Access to community resources. Section 1.0**

**Community Resources:** Resources in which the hh members have no individual claim to and which are shared together by all the village

**Community Land:** The area official demarcated by the village as shared/public land.

**Squatting farmers Land:** Communal land where individual hhs make sole claim to (for crop farming or fenced livestock) without official rights to ownership.

**Available remaining Land:** Official area of communal land minus areas of squatting farmers.

**Government Land Reserve:** Area set aside by the government as national reserve

**Community tree planting scheme(Section 14.3)**

**Community Forest:** A forest planted on the communal land which is planted, replanted or spt planted by the members of the village.

**Plant Planting:** An area designated by the village for planting a block of trees.

**Spot Planted:** Replanting an area where selective logging has been carried out. A tree is planted to replace the one that has been cut.

**Indigenous Trees:** Trees that are native to Tanzania

**Exotic Trees:** Trees that are not native to Tanzania

**Non Government Organisation:** Is managed by people from outside the village and it normally covers more than one village/District/Region. Its function is to provide deveoopment assistance to the farmer and is free from direct government links.

**Village level organization:** is managed by members of the village. Its purpose is normally to access/provide development assistance to the village

## ACCESS TO COMMUNAL RESOURCES

1. ACCESS TO COMMUNITY RESOURCES									
1.1 Does the village set aside an area for communal resources e.g. forest, grazing, etc. (Yes =1, No =2) <input type="checkbox"/>									
(If the answer is no proceed to 1.2)									
Area of Community, Village, Ward resources		Area in acre							
1.1.1	Total area of communal land	<input type="text"/>							
		Official figures from the leader							
1.1.2	Area of squatting farmers in communal land	<input type="text"/>							
		Key informant (Leader/Extension officer etc.)							
1.1.3	Remaining available communal land	<input type="text"/>							
		Key informant (Leader/Extension officer etc.)							
1.1.4	Government reserve land	<input type="text"/>							
		Key informant (Leader/Extension officer etc.)							
1.2 UPAFIKANAJI NA MATUMIZI YA MALIASILI ZA JUMUIYA/KUJIHUSHEHIA									
Community Resources		Distance from the resource in Km -season		Main Use		Instructions on distance from the resource (Cols 2 and 3): Distance is estimated from the centre of the village.  If under 1 km 1, enter 0 If above 1 km 1 enter whole number, eg. 1.5km= 2km, 1.25km= 1km			
		Dry (1)		Rainy (2)					
1.2.1	Water for human consumption	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	Main uses (Col. 4): Home or farm/livestock consumption...1 Sold to traders in the village...2 Sold to the village market...3 Sold to local wholesalers...4 Sold to Big wholesalers...5 Not available...6			
1.2.2	Water for livestock	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
1.2.3	Communal grazing land	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
1.2.4	Communal firewood	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
1.2.5	Wood for charcoal burning	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
1.2.6	Wood for building poles	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
1.2.7	Forest for bee keeping (honey)	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
1.2.8	Hunting	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
1.2.9	Fishing	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>				
2.0 COMMUNITY PLANTED TREES									
2.1 Did your village have community planted trees during 2007/08 agriculture year? (Yes=1, No=2) <input type="checkbox"/>									
(If the answer is no proceed to Section 3.0)									
Details of the community tree planting scheme									
No.	Reasons for community forest	Forest Area (acre)	Type of Planting	Type of Trees	Source of seeds/Seedlings	Number of Years since the start of planting	Main uses 2007/08 agriculture year	Main uses of communal forest products	
2.2	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Type of planting (Col. 3): Plantation planting.....1 Spot planting.....2		Source of seedlings (Col. 5): Seeds collection and planting.....1 Village Nursery.....2 Department of Forestry.....3 Private Individuals.....4		Main Uses (Col. 7): Poles.....1 Wood.....2 Charcoal.....3 Firewood.....4 Other (Specify).....5		Main use of revenue (Col. 8): Village development fund.....1 Household use.....2 Household income.....3			
Type of trees (Col. 4): Indigenous trees.....1 Exotic trees.....2 Both types.....3									
3.0 Non governmental Organisation (NGOs) Contact									
3.1 Did any NGO visit the village during 2007/08 agriculture year? (Yes=1, No=2) (If no proceed to Section 4) <input type="checkbox"/>									
4.0 Community Based Organisation									
4.1 Did the village have any CBO during the 2007/08 agriculture year? (Yes=1, No=2) <input type="checkbox"/>									
No.	Type of NGO	Visited Yes=1, No=2	Number of visits	Distance to the Office (km)	No.	Type of CBO	Visited Yes=1, No=2		
3.2	Extension/ Research	<input type="text"/>	<input type="text"/>	<input type="text"/>	4.2	Extension/ Research	<input type="text"/>		
3.3	Service/ Input provision	<input type="text"/>	<input type="text"/>	<input type="text"/>	4.3	Service/ Input provision	<input type="text"/>		
3.4	Community Development	<input type="text"/>	<input type="text"/>	<input type="text"/>	4.4	Community Development	<input type="text"/>		
3.5	Other	<input type="text"/>	<input type="text"/>	<input type="text"/>	4.5	Other	<input type="text"/>		
5.1 Did the village have Field farm schools during 2007/08 agriculture year? (Yes=1, No=2) <input type="checkbox"/>									
5.2 Did the village participate in any research on crops/ improved livestock during the village during 2007/08 agriculture year? (Yes=1, No=2) <input type="checkbox"/>									
5.3 Did the village have local ironsmiths during 2007/08 agriculture year? (Yes=1, No=2) (If the answer is 2 proceed to q. 5.5) <input type="checkbox"/>									
5.4 Did the village have any training centres on draft animals during 2007/08 agriculture year? (Yes=1, No=2) (If number 2 is the answer conclude the enumeration) <input type="checkbox"/>									
5.4 Number of local ironsmiths		<input type="text"/>		5.6 Number of training centres for draft animals		<input type="text"/>			

**Procedure:** Administer this from after completing all smallholder questionnaires for the village.

1. Copy the name of all crops from Sections 5.1, 5.2 and 5.3 grown in the village from smallholder questionnaires. This should also include livestock raised by the household from questions 9.1, 9.3, 9.4 and 9.5 and enter them in col na 1 of this form. Also see codes for livestock below.
2. Enter price estimates per kg in col 5 and 6.

<b>Type of livestock(Col 2)</b>	
Cattle .....01	Ducks.....07
Goat.....02	Turkey.....08
Sheep.....03	Rabbit.....09
Pigs.....04	Kanga.....10
Poultry.....05	Simbilisi.....11
Donkeys.....06	

**Main product- CROPS (sCol4)**

Cereals.....01	Flowers eg. Pyrethrum.....07
Green maize.....02	Vegetables.....08
Green leaves and stem.....03	Fruit.....09
Straw, dry stems etc..04	Other.....10
Roots and tubers, etc.....05	
Leaves (Tobacco etc).....06	

**Main product-**  
**LIVESTOCK**  
**(Col. 4)**  
Live animals.....01  
Meat .....02  
Milk.....03  
Eggs.....04

Quantity  
(Col.5)
