FOREWORD

I have the great pleasure to present the National Report on the Final Results of the Census of Agriculture in Cambodia (CAC) 2013 which contains figures on the number of households engaged in agricultural activities and other important information. In August 2014, the preliminary results on number of households engaged in agricultural activities and other important indicators were released based on the core module of the CAC provided by enumerators. This final results are based on detailed scrutiny of both the data provided by the core module and additional information from the supplementary module. The supplementary module of the CAC sampled the households with agricultural holdings, with a sample size of approximately 98,000 households.

Some of the most important results of the CAC presented in this report will serve the needs of data users in agriculture sector. The other results will be published in due course after detailed analysis. The release of the final results of the first CAC 2013 marks a first important stage in the statistical history in Cambodia.

I would like to express my deep gratitude to **Samdech Akka Moha Sena Padei Techo HUN SEN**, Prime Minister of the Kingdom of Cambodia for his constant support which enabled successful completion of the census. It was my privilege and pleasure to function as Chairman of the National Census Committee.

I would like to thank the Capital and Provincial Governors and members of the National Census Committee and Capital and Provincial Census Committee for their assistance. Our thanks are due to the Press, the Radio and the TV who played a very important role in census publicity.

On behalf of the Royal Government of Cambodia, I would like to thank FAO, the Swedish International Development Cooperation Agency, Australian Aid and USAID for providing financial and technical assistance to the CAC 2013. My deep appreciation goes to all the National Institute of Statistics staff and officers of the Ministry of Agriculture, Forestry and Fisheries involved in various stages of the census for their efforts, support and good work in making the census a success.

The major share of the credit for the success of the CAC is due to the cooperation from the Cambodian people themselves and hardworking officers including enumerators, supervisors, village chiefs, commune and district census officers and regional and assistant officers of the National Institute of Statistics (NIS), Ministry of Planning and the Ministry of Agriculture, Forestry and Fisheries.

I extend my deep appreciation to H.E. Mr **San Sy Than**, Secretary of State of the Ministry of Planning and former Director General of the National Institute of Statistics and H.E. Ms **Hang Lina**, Director General of the National Institute of Statistics NIS and all staff in the core technical working group for their effort in making the census a success.

I hope that Ministries, institutions, organizations, international agencies, researchers, policy makers and the public will find this report useful.

CHHAY THAN
Senior Minister
Minister of Planning

Phnom Penh
December 2015

Composition of the National Committee for the Census of Agriculture in Cambodia, 2013

H.E. Chhay Than	Senior Minister, Minister of Planning	Chairman
H.E. Chan Tong Yves	Secretary of State, Ministry of Agriculture, Forestry and Fisheries	Vice Chairman
H.E. Sak Setha	Secretary of State, Ministry of Interior	Vice Chairman
H.E. Hang Chuon Naron	Secretary of State, Ministry of Economy and Finance	Vice Chairman
H.E. In Saroeung	Secretary of State, Ministry of Planning	Permanent Vice Chairman
H.E. Sam Sotha	Secretary of State, Council of Ministers	Member
H.E. Rath Sarin	Secretary of State, Ministry of Land Management, Urban Planning and Construction	Member
H.E. Yin Kim Sean	Secretary of State, Ministry of Environment	Member
H.E. Pit Chamnan	Secretary of State, Ministry of Education, Youth and Sport	Member
H.E. Veng Sakhon	Secretary of State, Ministry of Water Resources and Meteorology	Member
H.E. Thach Phen	Secretary of State, Ministry of Information	Member
H.E. San Visal	Secretary of State, Ministry of Rural Development	Member
H.E. San Sy Than	Under Secretary of State, Ministry of Planning, and Director General, National Institute of Statistics	Secretary

Composition of the Technical Committee for the Census of Agriculture in Cambodia, 2013

H.E. In Saroeung	Secretary of State, Ministry of Planning	Chairman (Until 23 September 2013)
H.E. Rin Virak	Secretary of State, Ministry of Planning	Chairman (From 24 September 2013)
H.E. Tuy Chamroeun	Under Secretary of State, Ministry of Planning	Vice Chairman
H.E. Hor Darith	Under Secretary of State, Ministry of Planning	Vice Chairman
H.E. San Sy Than	Director General, National Institute of Statistics and Under Secretary of State, Ministry of Planning	Permanent Vice Chairman (Until 02 April 2013)
H.E. Ms. Hang Lina	Director General, National Institute of Statistics	Permanent Vice Chairman (From 03 April 2013)
Mr. Hong Narit	Director of Planning and Statistics, Ministry of Agriculture, Forestry and Fisheries	Vice Chairman
H.E. Seng Soeurn	Deputy Director General, National Institute of Statistics	Member
H.E. Phoeuk Sarin	Chief Cabinet, Ministry of Planning	Member
Mr. Khin Sovorlak	Deputy Director General, National Institute of Statistics	Member
Mr. Chhay Satya	Deputy Director General, National Institute of Statistics	Member
Mr. Mich Kanthul	Director of Economic Statistics, National Institute of Statistics	Member
Mr. Kim Phalla	Director of Economic Policy and Public Finance Ministry of Economy and Finance	Member
Mr. Ya Sadet	Director of Planning, Council of Ministers	Member
Mr. Long Sokha	Director of Agriculture, Council of Ministers	Member
Mr. Phoung Sophea	Director of Economic Development, Investment and International Relations, Ministry of Land Management, Urban Planning and Construction	Member
Mr. Chan Sovanna	Deputy Director of General Administration, Ministry of Interior	Member
Mr. Srun Pithou	Deputy Director of Planning and Public Relations, Ministry of Rural Development	Member
Mr. Nop Sothearith	Deputy Director of Planning and Legal Affairs, Ministry of Environment	Member
Mr. Oung Borat	Deputy Director of Planning , Ministry of Education, Youth and Sport	Member
Mr. Ly Chhay	Deputy Director of Planning and International Cooperation, Ministry of Water Resources and Meteorology	Member
Ms. Meas Sotheavy	Deputy Director of Planning and Statistics, Ministry of Agriculture, Forestry and Fisheries	Member
Mr. Kong Siek Ly	Chief of Bureau, Ministry of Environment	Member
Mr. Pich Pothy	Deputy Director of Economic Statistics, National Institute of Statistics	Secretary

Composition of the Publicity Committee for the Census of Agriculture in Cambodia, 2013

H.E. In Saroeung	Secretary of State, Ministry of Planning	Chairman
H.E. Thach Phen	Secretary of State, Ministry of Information	Vice Chairman
H.E. Kem Gunawadh	Delegate of the Royal Government in charge of the Director General, National Television of Cambodia, Ministry of Information	Vice Chairman
H.E. Tan Yan	Delegate of the Royal Government in charge of the Director General, National Radio of Cambodia, Ministry of Information	Vice Chairman
H.E. San Sy Than	Under Secretary of State, Ministry of Planning, and Director General, National Institute of Statistics	Permanent Vice Chairman
Mr. Hong Narit	Director of Planning and Statistics, Ministry of Agriculture, Forestry and Fisheries	Member
H.E. Ms. Hang Lina	Deputy Director General, National Institute of Statistics	Member
Mr. Phoung Sophea	Director of Economic Development, Investment and International Relations, Ministry of Land Management, Urban Planning and Construction	Member
Mr. In Sambol	Deputy Director of Planning, Ministry of Rural Development	Member
Mr. Ly Chhay	Deputy Director of Planning and International Cooperation, Ministry of Water Resources and Meteorology	Member
H.E. Seng Soeurn	Deputy Director General, National Institute of Statistics	Secretary

Summary Indicators

Household Agricultural Holdings	
<p>The CAC 2013 utilized six questionnaires for the census and survey in the household sector. Two questionnaires (Forms A & B) were used in the core module phase and canvassed on census basis. The other four questionnaires (Forms C, D, E & F) were meant for the supplementary module phase and detailed data were collected in them on sample basis. This apart, one questionnaire (Form G) was self-administered by the village leaders to collect information on topographical feature, calamity/disaster, availability of economic activities, etc. along with availability of village level infrastructure. It may be noted that there were separate questionnaires for the non-household agricultural farm operators.</p> <p>Below the level of the province, the country is composed of three administrative units with the smallest unit of administration defined as the village, followed by the commune and district. Cambodia's 14 073 villages are clustered within 1 621 communes which are grouped within 194 districts. Some of the key estimates obtained from the CAC 2013 are presented below for the country as a whole.</p>	
Core Module: Infrastructure in Cambodia	
<i>A total of 12,604 village heads were interviewed, covering all 25 provinces of Cambodia (including Tboung Khmum), with urban areas of Phnom Penh excluded from the census.</i>	
Percentage of villages reported to produce only one crop per year	50%
Percentage of villages reported to have rice mills for agro-processing	80%
Percentage of villages reported the use of mobile phones	77%
Percentage of villages reported to have either a health centre or a health clinic or a hospital	24%
Percentage of villages reported to have access to water through tube and pipe water wells	80%
Percentage of villages with direct access to a national road	35%
Percentage of villages exposed to flooding in the five years prior to the census	39%
Percentage of villages exposed to drought and/or food shortage in the five years prior to the census	38%
Core Module: Agricultural Holdings and Land Tenure	
Number of households listed (25 provinces and 5 districts in Phnom Penh)	2.6 million

Number of households listed with household agricultural holdings (engaged in growing of crops on at least 0.03 ha and/or with minimum of 2 large livestock, and/or 3 small livestock and/or 25 poultry)	2.1 million
Total area of all household agricultural holdings (including homelots)	3.3 million ha
Total area of 101 juridical holdings listed	0.8 million ha
Number of household agricultural holdings with separate agricultural lands listed	1.9 million
Number of households engaged in agricultural activity on their homelot only listed	253,437
Percentage of households with agricultural holdings from total households listed	82.0%
Percentage of households engaged in agricultural activity on their homelot only from total household agricultural holdings listed	11.9%
Percentage of households engaged in growing of crops on agricultural lands from total households with agricultural activities	85.3%
Average number of parcels per household agricultural holding including homelots	2.5
Average area per parcel in household agricultural holdings including homelots	0.6 ha
Average area of household agricultural holding with separate agricultural lands excluding the homelot	1.6 ha
Average area of household agricultural holding with separate agricultural lands including the homelot	1.7 ha
Average area for all household agricultural holdings (including homelots)	1.55 ha
Percentage of household agricultural holdings of size less than 1 ha from the total of household agricultural holdings with separate agricultural lands	47%
Percentage of area occupied by household agricultural holdings of size less than 1 ha from the total area of household agricultural holdings with separate agricultural lands	26.6%
Percentage of household agricultural holdings of size 20 ha or more from the total of household agricultural holdings with separate agricultural lands	0.24%
Percentage of land area occupied by household agricultural holdings of size 20 ha or greater from the total area of household agricultural holdings with separate agricultural lands	6.1%
<p style="text-align: center;">Supplementary Module: Crop Cultivation</p> <p><i>(The supplementary module of the CAC sampled the households with agricultural holdings, with a sample size of approximately 98,000 households.)</i></p>	
Percentage of area (gross) planted to cereal and grain crops from the total area of household agricultural holdings	74.2%

Percentage of area (gross) planted to rice crops from the total area of household agricultural holdings	70.3%
Percentage of area (gross) planted to non-aromatic rice crops from the total area planted to cereal and grain crops	83%
Percentage of area (gross) planted to cassava crops from the total area of household agricultural holdings	9%
Percentage of area (gross) planted to cassava crops from the total area planted to tuber, root and bulk crops	98%
Percentage of area (gross) planted to oilseeds from the total area of household agricultural holdings	1.0%
Percentage of area (gross) planted to vegetables from the total area of household agricultural holdings	1.3%
Percentage of parcels irrigated from the total number of parcels in household agricultural holdings including homelots	32.2%
Percentage of area (net) irrigated from the total area of household agricultural holdings	22%
Percentage of area (net) of rice crop irrigated from the total area of rice crop planted	27.9%
Percentage of agricultural households using inorganic fertilizers	70%
Percentage of agricultural households using organic fertilizers	50%
Percentage of agricultural households applied fungicides to eradicate fungal disease	9%
Percentage of agricultural households reported the use of self-sourced rice seed	72%
Percentage of agricultural households reported the use of extension services provided by government	30%
Percentage of agricultural households reported to receive agricultural information from the radio	52%
Percentage of agricultural households reported to be aware of the location of nearest market for agricultural produce	70%
Supplementary Module: Raising of Livestock and Poultry	
Percentage of agricultural households keeping and raising livestock and/or poultry	75%
Percentage of agricultural households keeping and raising large livestock	66%
Percentage of agricultural households keeping and raising small livestock	28%
Percentage of agricultural households keeping and raising poultry	85%

Percentage of agricultural households keeping and raising pigs from all households keeping and raising small livestock	98%
Percentage of agricultural households keeping and raising 2 to 9 large animals from total agricultural households keeping and raising large livestock	86%
Percentage of agricultural households rearing between 25 and 499 poultry birds from total agricultural households keeping poultry	70%
Percentage of adult chickens (10 days or more) to all chickens	57%
Percentage of adult ducks (10 days or more) to all ducks	82%
Percentage of agricultural households reported to keep livestock and poultry within their homesteads	90%
Percentage of cattle disposed of through sale live from total agricultural households keeping and raising cattle	78%
Percentage of buffalo disposed of through sale live from total agricultural households keeping and raising buffalo	55%
Percentage of pigs disposed of through sale live from total agricultural households keeping and raising pigs	90%
Percentage of chickens disposed of through sale live in market from total agricultural households keeping chickens	47%
Supplementary Module: Fishing and Aquaculture	
Number of households engaged in fishing and/or aquaculture listed	525 952
Percentage of households engaged only in fishing from the total number of households engaged in fishing and/or aquaculture	11%
Percentage of agricultural households engaged in aquaculture from the total number of households engaged in fishing and/or aquaculture	1%
Percentage of agricultural households engaged in fishing mainly to meet household consumption needs from the total number of households engaged in fishing	90%
Percentage of agricultural households conducting aquaculture for purpose of breeding or rearing aquatic plants or animals in natural or artificial ways from the total number of households engaged in aquaculture	90%
Percentage of agricultural households reported to use technique of lift and push nets for fishing from the total number of households engaged in fishing	60%
Supplementary Module: Supplemental Economic Activity in Agricultural Households	
Percentage of agricultural households reported to be engaged in forest-related activities from the total household agricultural holdings	38%
Percentage of agricultural households reported to be engaged in forest-related activities for gathering firewood and/or harvested bamboo from the total agricultural households reported to be engaged in forest-related activities	97%

Percentage of agricultural households reported to be engaged in micro-trading business from the total household agricultural holdings	11%
Supplementary Module: Agricultural Households and Population	
Estimated population of households with agricultural holdings	8.5 million
Sex ratio (no. of females per 1000 males) among population of households with agricultural holdings	997
Percentage of male-headed households	78.2%
Percentage of female headed households	21.8%
Mean age of population	28.8 years
Percentage of dependent household members (those less than 15 years and those 60 and older) of the total population	32%
Percentage of married members of the total population	52%
Supplementary Module: Food Security of Agricultural Households	
Percentage of agricultural households consumed rice seven days per week on average	96%
Average number of days per week consumed vegetables by the agricultural households	4.8 days
Average number of days per week consumed meat and meat products by the agricultural households	3.8 days
Average number of days per week consumed fish by the agricultural households	3.5 days
Average number of days per week consumed fruit by the agricultural households	1.7 days
Percentage of agricultural households reported to have experienced food insecurity and shortages during the 12 months	16%
Percentage of agricultural households that experienced food insecurity and shortages caused by low crop yield	80%
Percentage of agricultural households reported to have resolved the problem of food shortage including the primary solution of borrowing money, securing food on credit or as advance payment for manual labour to be undertaken at the time of the next harvest of the total households experienced food insecurity	89 %

Chapter 1 - Scope, Coverage and Sample Design

The Census of Agriculture in Cambodia (CAC), conducted in 2013, was a comprehensive statistical undertaking for the collection and compilation of information on crop cultivation, raising livestock and poultry, and aquaculture operations. The data collected and generated from this census will be useful in the formulation of plans, policies and programs for the development and improvement of the agriculture and fisheries sectors in the Royal Government of Cambodia (RGC). This was the first census of agriculture conducted in the Kingdom of Cambodia.

The National Institute of Statistics (NIS) of the Ministry of Planning, and the Ministry of Agriculture, Forestry and Fisheries (MAFF), were the responsible government ministries authorized to undertake the CAC 2013. While the NIS had the census mandate, the MAFF will be the primary user of the data produced from the census.

Objective

The main objective of the CAC 2013 was to provide data on the temporal agricultural situation in the Kingdom of Cambodia to be utilized by planners and policy-makers. Specifically, the census data will be useful in:

1. Providing a sampling frame in the conduct of agricultural surveys;
2. Providing data at the smallest administrative unit in the country; and,
3. Providing data on the current structure of the country's agricultural holdings, including cropping, raising livestock and poultry, and aquaculture activities.

Whilst a limited data set at the national, regional and provincial level is presented in the summary statistical tables annexed to this report, there is a very large and detailed data set that is accurate to commune level accessible through the NIS. The full coverage of the census and the supplementary module generated by the surveys can be examined in the detail of the questionnaires available from the NIS website. These data create the potential for a wide range of analyses to be conducted that are well beyond the scope of this report.

Approach

The broad approach for the CAC was to identify and approach all households in all provinces in Cambodia with the exception of the urban area of Phnom Penh. Census enumerators were mobilized in all provinces and trained for this massive undertaking. Of 2.6 million households in the census target area, 2.1 million household agricultural holdings were identified according to the pre-requisite conditions for a minimum cropping area of 0.03 ha and/or having at least 2 large livestock and/or three head of small livestock and/or a minimum of 25 poultry. Those 2.1 million households were identified as having 5.66 million parcels of land within their holdings and a total area of 3.3 million hectares of land. These households provided basic information on the household, the nature of their holdings and their agricultural activities to provide a very complete data set for selected key questions. In order to expand the data set and cover a much more detailed set of questions, a survey approach was used with a Probability Proportional to Size (PPS) sampling to gather data on all relevant household agricultural activities and conditions.

The information set was further expanded with a questionnaire for village heads and follow up questions for all of the juridical holdings encountered in the census. Because the census was directed at the household sector, only a limited number of juridical holdings were encountered in the process.

Information on the juridical holdings should not be considered as comprehensive given the limited scope for their inclusion in the information gathering process. The agricultural census was primarily a task of complete enumeration of all households in the country and household agricultural holdings in particular. The households resident in urban Phnom Penh were excluded from the census area.

Once households were identified as qualifying for inclusion in the census as having agricultural holdings, their land holdings were assessed in terms of whether the holdings consisted of a homelot with separate agricultural lands or only a homelot and the production activities were assessed for these different types of holdings. For the survey questions, the target population was restricted to the holdings that included separate agricultural lands and also those households with only a homelot with agricultural activities within were included in the sample frame. These amounted to 1.88 million households with some 5.4 million parcels of land within their holdings, and an area of 3.3 million ha.

Census Scope

The CAC 2013 utilized six questionnaires for the census and survey in the household sector. Two questionnaires (Forms A & B) were used in the core module phase and canvassed on census basis, aiming to cover every household outside the urban districts of Phnom Penh. The other four questionnaires (Forms C, D, E & F) were used in the supplementary module phase and detailed data were collected on a sample basis. One questionnaire (Form G) was administered to the village leaders to collect information on topographical features, calamities or disasters, availability of economic activities, etc. along with availability of village level infrastructure. Separate forms were used to collect data for the non-household agricultural holdings. The questionnaires are available on the website for the NIS.

The scope of each questionnaire was as follows:

Form A – Listing Form: Collected information on the location and involvement of households in agriculture or aquaculture activities. This form was used to identify households qualifying for inclusion in the census by having a land holding used for agricultural purposes.

Form B – Basic Information on the Agricultural Holding: Collected information on the location, the respondent and the agricultural holding. Information included the legal status of the agricultural holding, basic characteristics of the holding such as size, number of parcels in the holding and location, actual area, main land use, land tenure of each parcel in the holding, presence of forest and other wooded lands, use of irrigation, temporary crops planted, permanent crops planted, main purpose of production, livestock and poultry raised in the holding, presence of aquaculture and the landholder's household information.

Form C – Growing of Crops: Collected information on the location, respondent and agriculture holders as well as sub-holders; temporary crops planted and harvested, including area planted, cropping duration, cropping pattern, and area harvested; permanent crops, including area of compact plantations and number of productive permanent crops in scattered planting, irrigation and other information regarding parcels and agricultural activities in the homelot; agricultural practices, implements, equipment and machinery used in the holding; agricultural services, membership in an organization and other relevant information.

Form D – Raising Livestock and Poultry: Collected information on the location, respondent, the

agricultural landholder and sub-holders; livestock and poultry raised as of the time of enumeration; inventory of livestock and poultry during the previous 12 months; equipment, machinery, buildings and access to agricultural extension services.

Form E – Aquaculture Activity: Collected information on the location, respondent and aquaculture operator and sub-operators; details of aquaculture activity, including types of culture, location, actual area, production facilities, types of water used, main species cultured and equipment and machinery used; household involvement, hired labor and other relevant information.

Form F – Relevant Information on the Agricultural Household: Collected information on the location, respondent and agricultural landholder; agricultural household population: total number, name, relation to head, sex, age, marital status, highest school grade completed, currently attending school, physical/psychological/mental difficulty; primary and secondary economic activity, status of employment and tasks done in own agricultural holding in previous 12 months; other farm labour, food security, other economic activities such as catching fish and aquatic products in marine or inland waters, forestry-related activities, etc.

Form G – Village Questionnaire: Collected information on soil types, main topographical features, susceptibility to calamity or disaster within the previous five years, economic activities available, seasonal labour movement, crop duration, presence of agro-processing equipment, machinery and facilities, mode of transport, availability of schools, communication facilities, health facilities, water facilities, access to roads and presence of markets, presence of people's organizations, presence of NGO/INGO, ethnicities and religion.

All households in the country were interviewed in the first phase using Form A to determine their involvement in agricultural holdings. In the case where a household was found to be involved in agricultural activities and qualified for inclusion, according to the definition of an agricultural holding, the household was further interviewed using Form B. Detailed data in respect of agricultural holdings were collected using appropriate Forms F and C and/or D and/or E during the supplementary module phase from a sample of households, which were selected using probability sampling methods.

Geographical Coverage

All households in the country, excepting four districts of Phnom Penh that were known to be core urban areas, were covered in the CAC 2013, along with large agricultural enterprises operated by corporations, cooperatives, government and private institutions – termed 'juridical holdings' – in the non-household sector.

Agricultural holdings owned, managed and operated by urban households or entities not encountered in the census coverage area were thus kept outside the purview of survey coverage. Smaller agricultural enterprises engaged in farming in the non-household sector could not be covered in the survey, as their inclusion in the survey was not considered economical. Villages with a very small number of agricultural households (five or less) were also excluded from the sampling frame for the supplementary modules.

Survey and Reference Period

The CAC 2013 was undertaken in two phases: A core module – to list all households in all villages in the country – was undertaken during 45 days from 17 April 2013 to 31 May 2013. The supplementary

module was conducted during the period November 1-22, 2013. There was a slight extension of the survey period in the supplementary phase due to heavy rain and problems of access for the survey teams, particularly in hilly areas.

The 12-month period prior to 1 April 2013 (i.e. from 1 April 2012 to 31 March 2013) was, in general, used as the reference period for Form A and Form B. For most of the items of Forms C, D, E and F, the reference period was the 12 months immediately preceding the surveys conducted in November 2013. However, the reference period for some of the items was different from the time period specified, and is thus indicated separately for data items in each questionnaire.

Sampling

In the core module, the listing and collection of some basic information about agricultural and aquaculture activities was conducted in respect of all households of all villages in the country. In the supplementary module, the survey was carried out both in the household and non-household sectors. These statistical units were categorized as agricultural households in the household sector, and large agricultural entities operated by corporations, cooperatives, government and private institutions in the non-household sector.

The list of villages compiled for the Population Census (PC) 2008 was used as the basic document for the listing work of the CAC 2013 in the core module phase. Then, the list of agricultural households prepared from the data collected in Form B, in the core module phase, was used as the sampling frame in the supplementary phase. 'Large' agricultural households were identified at this stage from the list. In addition, a list of 'special' agricultural holdings and 'juridical' agricultural holdings was prepared at the administrative level, and this list was used to include the 'large' agricultural holdings identified in the survey.

Survey Procedure

All data in the CAC 2013 were collected in de facto method by a group of trained enumerators and supervisors directly interviewing eligible members of farming households.

The respondents were any adult family member (18 years or older) of the household and knowledgeable of the agricultural holding's activities. The most qualified respondent was the agriculture holder. However, in his or her absence, the spouse or any son or daughter 18 years or older, could also act as the respondent. No household member below 18 years or neighbour or other household was interviewed or asked for the information on the household being surveyed.

Data in the census and survey were collected using standardised structured questionnaires guided by the *Instruction Manual for Field Staff*, which provided detailed concepts, definitions and procedures to be followed for collection of each item. The draft questionnaires and instructions manual were prepared on the basis of recommendations from the User-Producers Workshop. The census questionnaires and enumeration manuals were revised and finalised based on the results of a pilot census and experiences gained during that exercise. The *Instruction Manual for Field Staff* was supplemented by a set of checks on the consistency of data carried out in the field, at the data entry stage, and in the subsequent data validation processes.

Advocacy Plan

Before fieldwork commenced, a thorough advocacy plan was launched to gain the support and cooperation of all households and non-households engaged in agricultural activities in the country. Village leaders were enlisted to provide information locally and an awareness campaign was

undertaken in the mass media, including broadcasts on television and radio, the use of printed banners, posters and stickers on bags, T-shirts and caps used during the census and surveys. Leaflets and pamphlets were also prepared with explanations to such questions as: What is the Census of Agriculture in Cambodia? What agency is responsible for the conduct of CAC? How essential is the CAC 2013? This material is available on the NIS website for the CAC.

Sample Design and Field Operations

In general, a stratified two-stage sampling design was adopted for the survey. The First Stage Units (FSU) were villages within a commune. The Second Stage Units (SSU) were households with small agricultural holding within the sample villages. The FSUs were selected within each commune by systematic Probability Proportional to Size – size being the number of households with agricultural holdings. The SSUs were selected systematically with a random starting point. The first stage of sample selection was conducted at the commune level using a sampling rate of 50 percent in order to produce statistics at this level. Households with small agricultural holdings were selected with a sampling rate of 5 percent, that is, for every 20 households with small agricultural holdings, one was chosen as a sample household (see details of sampling design and estimation procedures at the end of Annex 1). All data in the core module of the CAC 2013 were collected from over 2.6 million households spread over 14 073 villages, 1 621 communes, 194 districts and 24 provinces by trained enumerators who were selected from among university students and graduates, and Village Animal Health Workers on the basis of qualifying tests. Subsequently, the data were separated to allow for the creation of the 25th province Tboung Khmum.

Field operations included training of supervisors and enumerators, data collection and supervision. Central and field staff from the NIS and MAFF, and the 4,000 hired field data workers, were trained before they undertook the data collection and supervision process. Since the CAC was composed of two modules, separate training was conducted for each module. There were two levels of training, conducted separately, in both the core module and supplementary module. The two levels of training for each module were: (a) training of trainers, which included NIS and MAFF central office staff, provincial heads and representatives; and (b) training of enumerators and team supervisors. All field officials including supervisors at all levels were trained extensively in concepts, definitions and procedures for data collection.

Whilst data in the core module of the CAC 2013 were collected from over 2.6 million households, the supplementary module – requiring relatively more skill and training – involved personnel drawn from university students and graduates, and local educated youth in place of the Village Animal Health Workers. The village questionnaire (Form G) was dispensed to village leaders in all villages during the census operation.

The accuracy of the final output of the CAC depended on the quality of the data collection from the households listed and enumerated. Even though training was conducted properly and data processing developed efficiently, if quality controls were not implemented efficiently during the data collection process, the final data would still be of poor quality. There were several levels of supervision and channels of communication in the CAC, as detailed in the *Supervisor's Manual*. This hierarchy of supervision and communication, along with separate comprehensive guidelines – highlighting different activities and quality control procedures – was prepared for the Provincial Census Supervisors and Team Supervisors to properly monitor the progress of listing and enumeration of the CAC, and for early detection of any problem of data collection.

Data Processing

Once the enumerators collected the entire data for a village, they submitted the completed questionnaires to their respective team supervisors who, in turn, carried out scrutiny checks and then submitted the questionnaires to the provincial headquarters at the end of each week. The responsible officials in the provincial headquarters rechecked the questionnaires and, finally, submitted them to the national headquarters for data entry and validation.

At the census headquarters, the completed questionnaires were received first in the documentation control unit, where certain minimum checks were conducted regarding coverage and completeness of questionnaires, before these were submitted for data entry and further processing.

The processing of data and computation was undertaken using the CSPro 5.0 data processing software package. Validation of the data began in the documentation stage and continued through data entry and processing in that the data entry package was embedded with consistency checks. This process was further supplemented by manual scrutiny, howler checks, and finally, computer editing.

Chapter 2 - Geography and Infrastructure in Cambodia

Bordered by Thailand, Laos and Vietnam to the west, north and east, Cambodia's four main topographical features are expansive plains, the great Tonle Sap Lake region, coastal areas abutting the Gulf of Thailand, as well as mountains, hills and highland plateaus. Within these zones, the topography and divergent soil types are major factors in determining the type of crops that are cultivated in Cambodian villages. The population is dispersed across 25 provinces and the municipality of Phnom Penh. Below the provincial and municipal level, the country is composed of three administrative units, with the smallest unit of administration defined as the village, followed by the commune and district.

Cambodia's 14 073 villages are clustered within 1 621 communes which are grouped within 194 districts. A total of 12 604 village heads were interviewed nationwide for the CAC (covering all 25 provinces, but excluding the most urbanized areas of Phnom Penh) regarding soil types, topography and village infrastructure.

Topography

Eight provinces constitute the Tonle Sap Lake Zone: Banteay Meanchey, Battambang, Pailin, Siem Reap, Oddar Meanchey, Kampong Thom, Kampong Chhnang and Pursat. Geographically hilly with mountains and plateaus, Pailin and Oddar Meanchey have no villages within the lake area. However, for historical and administrative reasons, these two provinces are still considered within the Tonle Sap Lake Zone, as both were once part of Battambang and Siem Reap. Around 30 percent of villages in Siem Reap, Battambang, Pursat and Kampong Chhnang are situated around the lake.

Seven provinces constitute the Plains Zone: Kampong Cham, Kandal, Phnom Penh, Prey Veng, Svay Rieng, Takeo and Tbong Khmum.

Six provinces constitute the Plateau and Mountainous Zone: Kampong Speu, Preah Vihear, Ratanak Kiri, Mondul Kiri, Kratie and Stung Treng. Ninety percent of villages in Preah Vihear, Pailin and Mondul Kiri, and between 60 percent and 80 percent of villages in Oddar Meanchey and Stung Treng are situated in hilly, mountainous and plateau areas.

Four provinces constitute the Coastal Zone: Kampot, Koh Kong, Preah Sihanouk and Kep. Within the four provinces, Kep has the largest percentage of villages (44 percent) located on coastal waters followed by Koh Kong (39 percent of villages) and Preah Sihanouk (21 percent in villages). Kampot has the lowest percentages of villages on coastal waters.

Soil Types

Almost 50 percent of villages in Cambodia are situated in areas of fine sandy soil and 10 percent are located in regions with coarse sandy soil. Fine sandy soil is found in higher concentrations in the provinces of Svay Rieng, Koh Kong, Siem Reap, Kampot, Prey Veng, Oddar Meanchey, Kampong Chhnang, Kratie, Preah Sihanouk and Pursat. Due to proximity to the coast, a combination of coarse and fine sandy soil is found in more than 70 percent of villages in Kep. The same is found in more than 50 percent of villages in the central and northern provinces of Kampong Speu, Stung Treng and Preah Vihear. Mineral-rich clayey soil is evident in more than 50 percent of villages in Battambang, Banteay Meanchey, Kratie, Kep, Preah Sihanouk and Pailin. In Ratanak Kiri Province, clayey soil is found in less than 15 percent of villages. Loamy soil, with its rich mix of sand, silt and clay, is evident

in more than 50 percent of villages in Stung Treng, Preah Sihanouk and Kandal, as well as in other provinces.

Susceptibility to Severe Weather

Cambodia is prone to heavy rains and floods in the wet season and drought in the dry season, with 39 percent of villages in the country experiencing flooding and another 38 percent facing drought and food insecurity in the five years prior to the undertaking of the census.

Countrywide, 26 percent of villages experienced typhoon-like conditions in the past five years, while in the coastal province of Kep the figure was much higher with 80 percent of villages experiencing such conditions. Serious flooding affected 75 percent of villages in north-western Banteay Meanchey province and floods are now an annual occurrence in parts of the province that border neighbouring Thailand. An equally high number of villages in Kampong Thom province (74 percent) suffered from flooding while more than 50 percent of villages in Kratie, Stung Treng and Prey Veng experienced floods in the five-year period prior to the census. Villages in Stung Treng (25 percent) and Kratie (21 percent) faced dangers related to landslides.

Drought and food insecurity also affected villages during the same five-year period, particularly Battambang (88 percent of villages); Pailin (62 percent), Oddar Meanchey (60 percent), Svay Rieng (59 percent), Prey Veng (58 percent), Kratie (57 percent) and Pursat (56 percent).

Economic Activity

Cambodia remains a predominately agricultural country. Economic life is dominated by crop cultivation, raising livestock and poultry, marine and riparian fishing, aquaculture, and the gathering of forest products. In the hilly uplands and plateau areas of Mondul Kiri, Stung Treng and Preah Vihear, 50 percent of villages still gather natural products from local forests. Around 66 percent of villages in Kep, Koh Kong and Preah Sihanouk provinces are primarily involved in fishing while 40 percent of villages in Kratie, Siem Reap, Koh Kong and Kampong Thom are engaged in aquaculture, which is a relatively new form of economic activity in these areas. The economically-active populations of villages also work in other industries and areas of employment to earn extra revenue when necessary, particularly in the vicinity of Phnom Penh where 40 percent of villages had more than one main area of income generation, and Kep, where more than 60 percent of villages turn to alternate sources of income generation when necessary.

Cropping System

Nationwide, around 50 percent of all villages in Cambodia produce only one crop per year and that figure increases to 80 percent for villages in the Phnom Penh area and in the provinces of Oddar Meanchey and Tbong Khmum. Provinces where two crops per year are produced include: Pailin, where 90 percent of villages cultivate two crops annually, and Kep, Takeo, Kampong Cham, Kampot, Prey Veng, Kandal, Pursat, Battambang and Kampong Thom.

Agro-processing and Rural Infrastructure

Availability of, and access to, agro-processing equipment and facilities are an important part of the production cycle for rural households, particularly the poor, who are dependent on agriculture, fisheries and forest products.

Threshers and harvesters are the most commonly available items of equipment for rural households while rice mills are the most commonly available facilities. Between 60 and 80 percent of villages reported that threshers, harvesters and mills were the most common items in terms of agro-processing equipment. However, there were more rice mills available than threshers and harvesters in 80 percent of villages.

Irrigation systems so vital for providing land with water, other than relying on rainfall, and improving crop production and pastures were available in only 20 percent of villages nationwide. Some villages in remote regions of Pailin, Preah Vihear, Ratanak Kiri and Stung Treng reported having no access to irrigation systems. At its most basic level, an irrigation system is the process under which water is moved from a source to an agricultural crop. Such systems normally involve the existence of infrastructure and equipment, such as irrigation canals, pumps, sprinkler systems or localized watering systems. It also includes manual watering of plants using buckets, watering cans or other devices.

Access to water, transport, education, communications, health facilities and other basic infrastructure is directly and indirectly required by agricultural communities to undertake their activities. The most common mode of transport in rural areas was the motorcycle. Motorized rickshaws, known as ‘tuk-tuk,’ and wooden trailers pulled by motorcycles, known locally as ‘remork,’ were present in 25 percent of villages as the main mode of transport for agricultural produce moved between farm holdings, markets, consumers and elsewhere. Tuk-tuks were most commonly found in the vicinity of Phnom Penh (79 percent of villages), Kep (61 percent) and Kandal (58 percent). Remorks were widely present in villages in Kep (78 percent), Kampot (46 percent), Phnom Penh (46 percent), Kandal (43 percent) and Preah Sihanouk (43 percent). In coastal and riparian provinces, boats were a common mode of transport between villages: Koh Kong (80 percent of villages use boats), Kratie (59 percent), Preah Sihanouk (59 percent), Stung Treng (58 percent) and Kep (50 percent). Other modes of transport include cars (owned or rented).

Communications

Mobile phones were used in 77 percent of villages across the country. The lowest number of mobile phone users was found in Battambang villages where just 38 percent of villages reported mobile phones usage. Fixed telephone lines were used as a means of communication in just 13 percent of villages across the country. Villages in Kampong Cham and Tbong Khmum reported the highest rates of fixed line telephone use, while Kratie had the least, with just 2 percent of villages using a traditional telephone. Internet access was available and used in 5 percent of villages nationwide and between 11 percent and 19 percent of villages in the provinces of Kandal, Mondul Kiri, Pailin and Kep. Just 2 percent of villages nationwide used the Cambodian postal service as a means of communication.

Health and Education Facilities

The number of villages with a health facility demonstrated the scarcity of such facilities throughout the country, and their concentration in certain areas. Of the total number of responding villages, 13 percent reported the presence of a health centre, while 8 percent reported the presence of health clinics and 3 percent reported hospitals. Villages in Kep, Mondul Kiri and in the vicinity of Phnom Penh had the largest number of villages reporting the presence of health facilities. Educational establishments were present in 67 percent of the country’s villages.

Figure 2.1 Villages reporting various categories of schools and other educational institutions.

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

There were 9 338 different types of established schools located in 9 506 villages in the country. Of the 9 338 government schools across the country, 6 583 were primary schools (present in 71 percent of villages), 1 601 were middle schools (present in 17 percent of villages), 445 were high schools (located in 5 percent of villages), and 118 were colleges or universities located in 1 percent of villages. There were also 626 other types of schools, located in the country.

Distributed by province, Battambang (785) had the largest number of primary schools followed by Prey Veng (560) and Kampong Thom (501). Other provinces had primary schools ranging in number from 100 to less than 500. Less populous provinces, such as Koh Kong, Preah Sihanouk, Mondul Kiri, Pailin and Kep, had less than 100 primary schools each. There were more than 100 middle schools in each of the provinces of Battambang, Kampong Cham, Kampong Thom, Kampot, Kandal, Prey Veng and Siem Reap, and a significant number of high schools were located in the more populous provinces such as Kampong Cham, Kandal and Siem Reap. Colleges, universities and higher, specialized education centres were mostly concentrated in urbanized areas, such as Phnom Penh and Siem Reap.

Water Sources

Drinking water was available from natural sources and commercial producers of bottled and potable water. Natural sources of water included: piped mains water, tubed or piped water wells, protected water wells, unprotected water wells, water taken directly from rivers, ponds, springs, creeks, streams, and rainfall gathered in receptacles. Eighty percent of responding villages reported that they accessed water through tubed and piped water wells, while 55 percent of villages reported accessing drinking water from rivers, ponds, springs and creeks. Rainwater was also collected for consumption in 80 percent of villages. Bottled drinking water was purchased in some 47 percent of all villages nationwide.

Access to National Roads

Around 35 percent of all villages in the country reported accessibility to the nearest national road and 53 percent of villages reported being within four kilometres of the nearest national road. Five provinces – Pailin, Kep, Preah Sihanouk, Kandal and Phnom Penh – had more than 50 percent of villages with close access to national roads. On the other hand, around 30 percent of villages nationwide were 10 kilometres or more from the nearest national road. Markets were available in 13 percent of villages in the country.

Figure 2.2 Percentage of villages reporting various distances to nearest national road.

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

Community organizations

Of the organizations, associations and cooperatives representing local interests in villages, such as farmers, fisher folk, livestock breeders and others, women's organizations were the most numerous in Cambodian villages with 34 percent of villages reporting the presence of such organizations. Battambang had the largest number of villages (99 percent) reporting the presence of women's organizations, while Kep had just 11 percent of villages reporting such organizations. In Kep, associations representing fisher folk were present in 33 percent of villages. Formal cooperatives were reported in just 3 percent of villages nationwide.

Chapter 3 – Agricultural Holdings and Land Tenure

The CAC defines an agricultural holding as an economic unit under single management with at least one of the following characteristics: a minimum of 300 square metres (0.03 ha) of land used wholly or partly for agricultural production; a minimum of two large livestock; a minimum of three small livestock; a minimum of 25 poultry. Thus, an agricultural holding can be comprised of crops only, livestock only, or poultry only. Alternatively, it can be a holding with a combination of crops, large or small livestock, or poultry. Two broad types of agricultural holdings were identified in Cambodia: household agricultural holdings, and juridical agricultural holdings. Juridical holdings are agricultural entities managed and operated by the State or private enterprises e.g. agricultural corporations, partnerships, cooperatives, private institutions, government institutions, etc.

Household Agricultural Holdings

The primary residence of a household agricultural holding is known as the homestead or ‘homelot’. The activities of agricultural household holdings in Cambodia were separated in three categories: a) agricultural activity within the homelot only; b) agricultural activity on land separated from the homelot; c) agricultural activity within the homelots as well as separate land.

About 1.88 million household agricultural holdings reported having agricultural lands separate to their homelots, measuring 3.07 million ha and used for growing crops. Of the 1.88 million household agricultural holdings, 90.5 percent (or 1.68 million holdings) had also undertaken agricultural activities within their homelots, with total size of 0.2 million hectares, therefore increasing the total area of the household agricultural holdings for those holders with separate agricultural lands to 3.27 million hectares.

A further 253 437 household agricultural holdings carried out their agricultural activities within their homesteads only, with a total estimated area used for agriculture of 37 437 ha. These household agricultural holdings had no separate agricultural lands.

Hence, the number of household agricultural holdings (with and without separate agricultural lands) in the country was reported at 2 129 149, with a total area of 3 304 738 ha.

Table 3.1 Number and Percentage of Household Agricultural Holdings

Data Items	Number	Area (in hectares)
Total household agricultural holdings	2 129 149	3 304 738
Holdings using separate lands and homelots	1 875 712	3 267 302
Holdings using portion of homelots only	253 437	37 437

Source: NIS, Census of Agriculture in Cambodia 2013

Size of Agricultural Holdings

Of the 1.87 million agricultural households with separate agricultural land, around 47 percent had plots of land measuring less than 1 ha in size. A further 45 percent comprised agricultural land measuring between 1 ha and 3.99 ha. Thus, 90 percent of Cambodian household agricultural holdings with separate land conducted their agricultural activity on less than 4 ha of land. A very small number (1.21 percent) of household agricultural holdings reported separate agricultural land of 10 ha or more.

Figure 3.1 Percentage of agricultural holdings with separate agricultural lands by size of holding

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

The majority of households with separate agricultural land were located in the Plains Zone, which accounted for 46 percent of the nationwide total of such holdings. Prey Veng (11 percent or 200 000 holdings), Takeo (170 000 holdings) and Kampong Cham (130 000 holdings) were the top three Plains Zone provinces with the largest number of households with separate agricultural land.

Figure 3.2 Average area per agricultural holding by province

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

By topographical zone, the Plains Zone had the largest number of households with agricultural land separate to homesteads. However, in terms of total area of agricultural lands utilized by households, the Tonle Sap Lake Zone surpassed the Plains Zone. The Tonle Sap Lake Zone had fewer households with separate agricultural land, but those households occupied a larger area of land than households in the Plains Zone. Pailin is the smallest province in the Tonle Sap Lake Zone, though the average area

of its agricultural land holdings (4.41 ha) was found to be far higher than the national average of 1.64 ha per holding.

The average size of the separate agricultural lands utilized by each household agricultural holding was reported at 1.64 hectare. The average area of the separate agricultural lands used by the household holdings in the Tonle Sap Lake Zone and Mountainous and Plateau Zone were higher than the national average. Sixteen provinces reported average household agricultural holdings larger than the national average of 1.64 ha. The average size of household agricultural holdings in these 16 provinces ranged from 5.01 ha in Oddar Meanchey and 3.01 ha in Banteay Meanchey to 1.75 ha in Kampong Thom and Tbong Khmum. In the Plateau and Mountainous Zone, all provinces (except Kampong Speu) reported an average land size of more than 2 ha for households with separate agricultural land. Provinces with the average size of their agricultural holdings below the national average included Kampong Speu (0.96 ha), Kep (0.91 ha), Takeo (0.91 ha) and Kandal (0.83 ha).

Agricultural households with larger holdings (50 ha or more) had an average holding of 190.47 ha, meaning that those with larger holdings had, on average, very large holdings.

Partitioning of Household Agricultural Holdings into Parcels

Agricultural holdings in Cambodia are generally composed of a number of partitioned pieces of land referred to as ‘parcels’. These parcels are defined as any piece of land under one land tenure type, (i.e. the right to use the land for agricultural purposes) which is entirely surrounded by other features not forming part of the holding, such as other land, water, roads, and forest. Such parcels may consist of one or more fields or plots adjacent to each other.

Figure 3.3 Percentage of agricultural holdings with separate agricultural lands by number of parcels (excluding homelots).

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

Ninety percent of household agricultural holdings in Cambodia are composed of between one and three parcels of land, while the 1.87 million households with separate agricultural land contained a total of 3 731 551 parcels of land. The total number of land parcels jumps to 5.4 million when homestead land is included with separate agricultural land. Thirty percent of all parcels are located within the homelots of household agricultural holdings. However, because parcels are generally smaller within homelots,

the national average size of parcels decreases from 0.82 ha to 0.60 ha when homelot parcels are included alongside the generally, larger parcels on separate agricultural land.

The main use of land parcels was for the cultivation of temporary crops (with a growing cycle of less than one year), with much smaller percentages of parcels allocated for permanent crops (growing longer than one year), and other purposes. Crop cultivation accounted for agricultural activity in 3.7 million parcels (68 percent of the total). In addition, crops were also grown within the homelot, and in combination with other agricultural activities, such as keeping livestock and/or poultry.

Figure 3.4 Percentage of land parcels (including homelots) by main use

Source: NIS-MoP, Census of Agriculture in Cambodia 2013/13

Main Land Uses of Parcels

Seven of every 10 parcels within household agricultural holdings were used for growing temporary and/or permanent crops. Around one-third of the parcels were used mainly as the residence of households with agricultural holdings though portions of these homelots were also used in growing crops and/or keeping livestock and/or poultry.

A very small percentage of parcels were left idle in the country during the five years prior to the census. Likewise, a very small percentage of parcels were used in undertaking other agricultural activities, such as cultivating temporary meadows, raising livestock and poultry, etc.

The average area per parcel devoted solely to temporary crops (0.79 ha) was lower than the average area of parcels devoted solely to permanent crops (1.27 ha), or parcels devoted to a combination of temporary and permanent crops (1.34 ha). The average size of parcels dedicated to cultivating temporary crops was smaller than parcels with permanent crops because of the much larger number of parcels devoted to temporary crops.

Figure 3.5 Average parcel size (ha) for various uses of land, for the holdings with separate agricultural lands.

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

Land Tenure of the Parcels

Agricultural households owned 98 percent of the parcels of land in their holdings, amounting to a total area of 3.17 million ha. Parcels owned by households were, on average, smaller than parcels that were rented for payment in terms of money and/or for barter with farm produce, given free, or occupied under another land tenure type. The average area per owned parcel was estimated at 0.59 ha. The largest average area per parcel was reported to be parcels rented for payment with either cash or barter with farm produce (1.56 ha). Parcels rented free of charge had an average area per parcel of 0.73 ha. Parcels under other land tenure types were, on average, 0.79 ha.

The Tonle Sap Lake Zone and the Plateau and Mountainous Zone had the largest number of owned parcels that were above the national average in size. Eight provinces in these two zones were reported to have average areas per owned parcel of more than 1 ha: Pailin (2.46 ha), Oddar Meanchey (1.82 ha), Ratanak Kiri (1.66 ha), Mondul Kiri (1.43 ha), Battambang (1.3 ha), Stung Treng (1.29 ha), Preah Vihear (1.14 ha) and Banteay Meanchey (1.13 ha).

Owned parcels with an average area of less than 0.5 ha were found mostly in the Plains Zone, namely Kampong Cham, Svay Rieng, Prey Veng, Kandal and Takeo. Provinces such as Kampong Speu, Kampong Chhnang, Kampot and Kep also reported owned parcels with an average area of less than 0.5 ha.

Figure 3.6 Average parcel size by province

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

Homelots Used for Agricultural Activities inside the Agricultural Holdings

Some 1.68 million households with separate agricultural land also utilized their homelots in the cultivation of crops and/or raising livestock and poultry. Homelots utilized for agricultural production by these households amounted to a total area of 215 329 ha with an average of 0.13 ha per homelot. Households in the Coastal Zone had the largest number of homelots utilized for agricultural activities followed by households in the Plains Zone.

The number of homelots used for agricultural activities in the Plains Zone was larger than that of the Tonle Sap Lake Zone. However, the total area of homelots in the Tonle Sap Zone was larger than the Plains Zone. The Plains Zone had the smallest reported average homelot area in the country.

Within household agricultural holdings with separate lands, 89 percent of homelots were used in the growing of crops and/or in raising livestock/poultry. Among the zones, the Coastal Zone had the largest estimated area of homelots used for agricultural activities, surpassing the national average. The Plains Zone was second to the Coastal Zone in exceeding the national average for the estimated area of homelots used in agricultural activities.

Figure 3.7 Average area of the homestead (ha) and estimate of the average area used for agricultural production.

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

Homelots Utilised for Agricultural Production for Holdings without Separate Agricultural Lands

There were 253 437 household agricultural holdings conducting agricultural activity exclusively within their homelots which had a total land area of 41 871 ha. Of that area, 89 percent of the land (37 437 ha) was used for growing crops and/or raising livestock and poultry, while the remaining land was used for activities such as storing agricultural machinery and equipment, harvested crops or keeping small livestock and poultry beneath houses.

Figure 3.8 Proportion of homelots used for agricultural activities by type of land tenure

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

A larger area of land within rented homesteads was used in agricultural activities compared to the

portion of land utilized for agriculture within owned homesteads, demonstrating that rented homestead were utilized to maximize agricultural activity. The proportion of the rented homelots used for agricultural purposes was also higher than the average proportion used by owned homesteads.

Juridical Agricultural Holdings

Juridical agricultural holdings are entities managed and operated by private or State enterprises, including corporations, partnerships, cooperatives, private institutions, government institutions, etc. During the conduct of the census, 101 juridical holdings were identified as engaged in agriculture, including growing crops, raising livestock, poultry, and aquaculture. The number of juridical holdings reported is relatively small and it is likely that coverage of juridical holdings during the census was limited by the techniques used for the collection of data from the field. The MAFF provided a listing of registered juridical holdings and contact details. Census enumerators attempted to contact all listed juridical holders, including visiting sites in the provinces and registered address in Phnom Penh. In some cases the attempts to contact the registered holders were not successful and in other cases the holders were not found to conduct agricultural activities on the holdings.

Seventy percent of identified juridical agricultural holdings were legally categorized as limited companies (either private or public). The remaining agricultural and aquaculture juridical holdings were registered as owned by sole proprietors, partnerships, and branches of a foreign company. Other types of juridical holdings may include State-owned organizations or their subsidiaries, etc. The area operated by the 101 juridical holdings totalled 806 628 ha or an average of 7 986 ha per holding. Data shows that just five of the juridical holdings accounted for 47 percent of the total 806 628 ha.

Figure 3.9 Percentage of juridical holdings by size

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

Almost all of the 101 juridical holdings had been managed and operated for less than 10 years. Forty-six percent had been in operation for less than five years and another 47 percent had been in operation from five to nine years. A small percentage had been in operation for 10 years or more. The total number of land parcels reported in juridical holdings was 202.

Figure 3.10 Average years of operation of juridical holdings by type of agricultural activity

Source: NIS-MoP, Census of Agriculture in Cambodia 2013

Chapter 4 – Crop Cultivation

The primary activities undertaken by household agricultural holdings in Cambodia were planting, irrigating, and harvesting of temporary and permanent crops. Temporary crops were those with a growing cycle of less than one year, and after harvest, they were either re-sown or replanted for another production cycle. Temporary crops presented in the census were those grown seasonally during the research reference period and involved 14 major crop classifications, including cereals and grains, leguminous grain plants, oil seed crops, root, tubers and bulk crops, spices, condiments, aromatic and medicinal plants, industrial crops, and a wide variety of vegetables.

Permanent crops were those with more than one year growing cycles and found to be still standing and productive within agricultural holdings. There were 11 major classifications used in identifying different permanent crops, including cultivated fruits, edible nuts, oil crops, rubber, spices and aromatic crops, and other non-food crops.

Crops in both categories were presented in terms of area planted, area harvested, and area irrigated. Area planted referred to the amount of land used for agricultural operations, calculated as the number of times the same crop or different crops were planted during the reference period.

Cereal and Grain Crops

The two major crops grown in this category were rice and maize. Based on land use reported, 2.45 million ha of grain and cereal crops were planted during the reference period, amounting to some 86 percent of the total number of land parcels used for temporary crops. More specifically, rice crops accounted for 82 percent of all temporary crops sown on land parcels in Cambodia.

Figure 4.1 Area planted to major cereal and grain crops

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Three types of rice were grown: non-aromatic, aromatic, and glutinous (sticky) rice. Maize crops were

classified in two groupings: young or ‘baby’ corn and white/yellow/purple corn. Of the three types of rice, non-aromatic varieties were the most common by far, planted on a total area exceeding 2 million ha and accounting for almost 3 million parcels of land.

Table 4.1 Number of parcels and area planted to major cereal and grain crops by variety

Major Cereal/Grain Crops	Number of Parcels	Area Planted (ha)	Average Area per Parcel (ha)
Non-aromatic rice	2 816 780	2 029 418	0.72
Aromatic rice	301 168	280 359	0.93
Maize	85 114	125 180	1.47
Sticky rice	49 355	18 028	0.37

Source: NIS, Census of Agriculture in Cambodia 2013

After non-aromatic rice, the most significant crops were aromatic rice, planted on more than 280 000 ha, and maize, planted over more than 125 000 ha, during the reference period.

The top 10 provinces that reported non-aromatic rice planted on 100 000 ha or more were: Battambang, Prey Veng, Siem Reap, Banteay Meanchey, Takeo, Kampong Thom, Svay Rieng, Kampong Speu, Kampot and Kampong Cham. Four provinces reported less than 10 000 ha planted with non-aromatic rice: Preah Sihanouk, Koh Kong, Kep and Pailin.

Agricultural holdings in all provinces also reported planting aromatic rice. Of these, nine provinces planted aromatic rice on more than 10 000 ha, namely, Banteay Meanchey, Battambang, Pursat, Siem Reap, Preah Vihear, Kampong Thom, Prey Veng, Kampong Speu and Takeo. Six provinces planted aromatic rice on less than 1 000 ha: Preah Sihanouk, Kampot, Ratanak Kiri, Koh Kong, Svay Rieng and Kep. Household agricultural holdings in Mondul Kiri did not report planting any aromatic rice.

Glutinous rice varieties were not planted as extensively as non-aromatic and aromatic rice. Eighteen provinces reported glutinous rice planted on more than 100 ha and just seven of those provinces reported glutinous rice varieties planted on more than 1 000 ha. The leading provinces for glutinous rice cultivation were Takeo, Svay Rieng and Prey Veng (in the Plains Zone), Kampong Speu, Preah Vihear and Ratanak Kiri (in the Plateau and Mountainous Zone), and Kampong Thom (Tonle Sap Lake Zone). Kratie, Preah Sihanouk, Koh Kong, Kep and Mondul Kiri reported less than 100 ha of glutinous rice planted. There was no glutinous rice reported in Kandal and Pailin.

Twenty-four provinces reported planting maize. Of these provinces, Battambang had 60 000 ha of maize, making it the leading province in terms of area planted. Other provinces with sizeable maize crops included Pailin (21 000 ha) and Kandal (14 000 ha). Kep and Oddar Meanchey had less than 100 ha of maize.

Figure 4.2 Area (ha) planted with maize (white/yellow/purple) in 10 provinces with largest maize areas.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 4.3 Number of land parcels and area (ha) planted to major cereal and grain crops

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Harvesting

Harvesting refers to the area from which a crop was reaped, either completely or partially, and excludes areas that, although planted, were not harvested due to crop failure, damage, or the harvest occurring beyond the reference period.

Across Cambodia, around 95 percent of the total area of land planted with rice was harvested. Non-aromatic rice accounted for the largest crop harvested at 1.8 million ha, and the highest proportion of

non-aromatic rice crop harvested vis-à-vis planting was in the Coastal Zone (96 percent of the total crop harvested). In the Plateau and Mountainous Zone, the harvest of non-aromatic rice reached around 94 percent of the area planted. In the Tonle Sap Lake Zone, 90 percent (around 812 000 ha) of the non-aromatic rice crop was harvested, and in the Plains Zone just over 88 percent (almost 664 000 ha) of the total crop was harvested.

Around 255 000 ha of aromatic rice was harvested, while glutinous rice accounted for the smallest harvest of all cereals and grains at 16 420 ha. Around 106 000 ha of maize (white/yellow/purple) was harvested, accounting for some 85 percent of the crop planted. The majority of the maize was harvested in the Tonle Sap Lake Zone.

Five provinces almost completely harvested their crops of non-aromatic rice: Battambang (170 000 ha), Prey Veng (162 000 ha), Siem Reap (137 000 ha), Takeo (127 000 ha) and Kampong Thom (120 000 ha). The greatest proportions of area harvested to area planted for aromatic rice was in Banteay Meanchey (41 000 ha), Pursat (32 000 ha), Battambang (25 000 ha), Siem Reap (24 000) and Preah Vihear (19 000 ha).

Maize was completely harvested in two provinces: Battambang (53 000 ha) and Pailin (17 000 ha).

Figure 4.4 Area harvested for major cereal and grain crops

Source: NIS-MoP, Census of Agriculture in Cambodia

(Supplementary Module 2013)

The area planted for all of the four cereal crops shown was bigger than the area harvested. At least 90 percent of each cereal crop planted was harvested during the reference period. Note that each cereal crop was harvested several months after this was planted.

Area harvested was either complete or partial. At least 80 percent of rice crops and 77 percent of maize (white/yellow/purple) were completely harvested during the reference period.

Figure 4.5 Percentage of crop harvested by type of grain crop

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

A small percentage of the rice and maize crops were harvested beyond the census reference period, whereas other portions of the crop were not harvested for reasons such as flood or pest attack.

Figure 4.6 Area harvested (completely, partially or expected to be harvested) for major cereal and grain crops by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

At the zone level, agricultural holdings in the Tonle Sap Lake Zone reported the highest area harvested for non-aromatic rice totaling 858 000 ha. Holdings in this zone also reported the largest harvest of aromatic rice and maize at 187 000 ha and 86 000 ha, respectively. Holdings in the Plains Zone reported a non-aromatic rice harvest of 686 000 ha.

Four percent (108 000) of land parcels planted with non-aromatic rice were due to be harvested after the census reference period. Non-aromatic rice planted in 16 000 parcels (0.5 percent) was destroyed by heavy rains, floods and other natural disasters. Aromatic rice planted in some 5 000 parcels of land

(2 percent) was due to be harvested after the census reference period, and 3 000 parcels (1 percent) were not harvested due to various problems.

Fourteen percent of the total number of land parcels sown with maize (white/yellow/purple) was due to be harvested after the census reference period. Another two percent (2 000) of the total maize parcels were not harvested due to natural calamities such as floods, heavy rains, etc.

Irrigation

Due to the presence of irrigation systems, the Plains Zone had the largest number of irrigated parcels of land (412 000 ha) planted with cereals and grains. Irrigated parcels with cereals and grains accounted for just 22 percent of the total area of all land parcels under temporary crops. Household agricultural holdings in the Tonle Sap Lake Zone had only half the amount of land under irrigation compared to the Plains Zone, yet households in the lake area had a larger area under temporary crops compared to the plains. The Tonle Sap Lake Zone, therefore, planted and harvested a much larger area than households in other zones, including the plains. The Plateau and Mountainous Zone and the Coastal Zone had the smallest area under temporary crop cultivation.

Figure 4.7 Area irrigated for cereals and grains by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Root and Tuberous Crops

Root and tuberous crops were grown on some 299 000 ha, including cassava, sweet potato, taro, arrowroot and yam. Cassava accounted for the largest share of such crops, accounting for almost 294 000 ha of the total area planted. However, cassava completely harvested in the reporting period was significantly lower at 211 000 ha.

Two provinces stood out for cassava farming, namely Battambang with 55 000 ha and Tbong Khmum with 50 000 ha. Crops of between 10 000 ha and 30 000 ha were planted in Kratie, Banteay Meanchey, Ratanak Kiri, Kampong Thom, Pailin, Kampong Cham, Oddar Meanchey, Preah Sihanouk and Stung Treng. The largest area planted with cassava (and the largest producer) was the Tonle Sap Lake Zone. However, the cassava harvest was just 65 percent of the total crop planted in the Tonle Sap Lake Zone

compared to 83 percent of the cassava crop harvested in the Plains Zone and 74 percent harvested in the Plateau and Mountainous Zone.

Figure 4.8 Top 10 provinces for area planted to cassava (ha).

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Roots and tuberous crops were harvested on 215 000 ha, of which cassava accounted for 98 percent of the total.

Figure 4.9 Percentage of parcels planted to cassava harvested during the reporting period.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Cassava planted in seven out of 10 parcels was completely harvested amounting to a total of 189 000 ha harvested during the reference period and 22 000 ha (11 percent of parcels) were partially harvested. A further 19 percent of land parcels devoted to cassava were due to be harvested after the census reference period, while 1 700 parcels (1 percent) were not harvested due to pests, drought or flood.

Figure 4.10 Area planted (ha), completely harvested and irrigated for cassava by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

There were 153 000 parcels of irrigated land under root, tubers and tuberous crops amounting to 16 251 ha. Cassava accounted for the vast majority, 15 487 ha (95 percent), of the total land irrigated in the root and tuberous crop category.

The Tonle Sap Lake Zone had the largest area where cassava was planted and harvested compared to all other zones. However, the gap between cassava planted and cassava harvested in this zone was wider compared to that of other zones. The cassava harvest by area in the Tonle Sap Lake Zone was 65 percent of the area planted with cassava. That figure compares less favourably to 83 percent of cassava harvested in the Plains Zone and 74 percent harvested in the Plateau and Mountainous Zone.

The Plains Zone also reported the largest irrigated area, about 59 percent, devoted to cassava. The Plateau and Mountainous Zone had the second largest irrigated area devoted to cassava.

Leguminous Grain Plants

Leguminous grain plants (commonly known as legumes) are an important sources of protein and an estimated 22 000 ha of legumes were reported planted, the most popular by far being mung bean (planted on 21 000 ha). Around 18 000 ha of the leguminous grain crop was reported harvested while just 4 000 ha of land devoted to legumes was irrigated, 92 percent of which were parcels of land under mung bean cultivation.

Figure 4.11 Top mung bean producing provinces by area planted (ha).

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Mung bean was cultivated primarily by household agricultural holdings in Battambang, Kandal, Kampot, Kampong Speu, Kampong Chhnang, Prey Veng and Siem Reap.

Oilseed Crops

Oilseed crops such as groundnut, sesame, soybean, castor bean, sunflower and cottonseed were planted on 34 000 ha of land, with soybean accounting for 58 percent of the total (20 000 ha distributed amongst 10 000 parcels). Around 31 000 ha of oilseed crops were harvested with soybean accounting for 61 percent of the harvest. Just 4 000 ha of oilseed crops were irrigated. Battambang, Ratanak Kiri and Preah Vihear had at least 3 000 ha of soybean each, making them the top three provinces in the country for soybean cultivation.

Among the oilseed crops, soybean was planted on 20 000 ha nationally.

Figure 4.12 Top three soybean producing provinces by area planted (ha).

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

The top three provinces for soybean cultivation were Battambang (9 000 ha), Ratanak Kiri (5 000 ha) and Preah Vihear (3 000 ha).

Spices, Condiments, Aromatic and Medicinal Plants

Spices, condiments, aromatic and medicinal plants (classified as temporary crops) were planted on some 18 000 ha, with caraway accounting for some 10 000 ha and lemongrass accounting for 4 000 ha of the total. Prey Veng province had the largest amount of land devoted to caraway (5 000 ha) with Banteay Meanchey following closely behind with 3 000 ha. Battambang and nine other provinces had the largest amount of lemongrass cultivation with each province reporting at least 100 ha. The harvest of spices, condiments, aromatic and medicinal plants amounted to 10 000 ha, and 8 000 ha of land devoted to these crops was irrigated.

Caraway was reported planted on more than 4 500 ha in Prey Veng and almost 3 500 ha in Banteay Meanchey. Battambang led other provinces with reported cultivation of lemongrass on more than 900 ha.

Figure 4.13a Top three caraway producing provinces by area planted (ha).

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 4.13b Top three lemon grass producing provinces by area planted (ha).

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Spices, condiments, aromatic and medicinal plants were harvested on some 10 000 ha with caraway accounting for 53 percent of the total harvest and lemongrass account for a further 23 percent of the total.

Of the 18 000 ha under spices, condiments, aromatic and medicinal plants, only 8 000 ha were irrigated. Caraway accounted for the largest number of irrigated parcels, 5 000 ha, followed by 926 ha of land irrigated for the cultivation of lemongrass.

Industrial Crops

Sugar cane, light tobacco and dark tobacco constituted the main industrial crops reported by household agricultural holding and were planted on more than 7 000 ha with sugarcane accounting for almost 50 percent of the total area planted (3 103 ha planted on around 7 000 parcels). Light tobacco accounted for another 3 000 ha. Around 4 000 ha of land under industrial crops was irrigated and around the same amount of land was harvested. Sugar cane was the leading industrial crop in Kandal province (854 ha) and light tobacco was common in Kampong Cham, Tbong Khmum and Kratie.

Of the 4 000 ha of industrial crops harvested, sugarcane account for 60 percent and light tobacco 36 percent. In addition, of the 4 000 ha of irrigated land devoted to industrial crops, 1 554 ha of irrigated land was devoted to sugar cane and 1 835 ha to tobacco.

Figure 4.14 Area planted, harvested and irrigated for sugar cane and light tobacco
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Vegetables

A wide variety of vegetables was cultivated across the country, including leafy, stem and fruit-bearing vegetables, root, bulb and tuberous vegetables, leguminous green vegetables, etc. Fruit-bearing vegetables were planted on 35 000 ha; leafy and stem vegetables on almost 6 000 ha. Cucumber accounted for the largest area planted with 7 000 ha (30 percent of the crop cultivated in Svay Rieng alone) followed by watermelon planted on 6 000 ha and chilli and pumpkin both on 5 000 ha each. Watermelons were cultivated on 800 ha in Kampong Thom province, 722 ha in Kampong Speu and 672 ha in Battambang. Water convolvulus, known locally as ‘trakuan’, was cultivated on 2 307 ha and 50 percent of the crop was located in the Plains Zone, specifically Svay Rieng.

Figure 4.15 Area (ha) planted to fruit-bearing vegetables for Cambodia

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Compact Plantations and Permanent Crops

Compact planting of permanent crops (those with more than one year growing cycles) included plants, trees, and shrubs planted in a regular and systematic manner such as in orchards, and plants, trees, and shrubs planted in an irregular pattern, but dense enough to be considered an orchard. As noted, there were 11 major classifications used in identifying the different permanent crops in Cambodia. However, not all of the permanent crops existed abundantly in the country. Thus, only major permanent crops in compact plantations were represented in the census.

Fruits

Citrus fruits were found in abundance in compact plantations in Cambodia, namely, oranges, tangerines, pomelo, lime, lemon and kaffir lime, as well as other fruits of the citrus family. The total area under compact planting for citrus fruits was reported at some 2 600 ha, accounting for just 0.7 percent of the total area of land parcels devoted to permanent crops. Among the citrus fruits, limes, lemons and oranges were the mostly commonly planted fruit in compact plantations, and the Tonle Sap Lake Zone reported the largest overall area devoted to citrus fruit: oranges (1 128 ha), grapefruit/pomelo (593 ha), lime/lemon (185 ha). Only six provinces reported growing citrus fruits on more than 100 ha, and Battambang province alone accounted for 51 percent of the total area planted with citrus fruits in compact plantations in Cambodia. Battambang is specifically known for oranges, grown in compact plantations on 755 ha, and pomelo planted on 559 ha.

There were 36 varieties of cultivated fruits sown in compact planting on 83 000 ha in the country. Mango trees had the largest compact planting area of 42 000 ha and banana plants came in second place with 24 000 ha. Kampot had the largest amount of land devoted to mango cultivation (6 300 ha) followed by Kandal (5 200 ha) and Kampong Speu (4 200 ha). Kampong Cham province was the leading province in terms of banana cultivation (5 000 ha) in compact plantations.

Figure 4.16 Area in compact planting of various citrus fruits

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Among the citrus fruits, orange trees occupied the greatest area in terms of compact planting with 1 325 ha. Pomelo trees and lime/lemon trees were planted on 687 ha and 473 ha, respectively. At the zone level, provinces in the Tonle Sap Lake Zone reported the most compact planting areas devoted to the three citrus fruits: oranges (1 128 ha); pomelo (593 ha) and, lime/lemon (185 ha).

Figure 4.17 Top 6 provinces growing citrus trees in compact planting

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

There were 36 varieties of cultivated fruits sown in compact planting on 83 000 ha in the country, accounting for 24 percent of the total area of land parcels used under permanent crops. Among these cultivated fruits, banana, mango, jackfruit, longan, custard apple, sapodilla, papaya and durian were planted in more than 1 000 ha. Mango trees had the highest compact planting area of 42 000 hectares. Banana plants ranked second with 24 000 ha.

Figure 4.18 Area of compact planting for various fruit trees

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Kampot reported 6 300 ha of mango trees in compact planting, followed by Kandal and Kampong Speu with 5 200 ha and 4 200 ha, respectively.

Figure 4.19 Top provinces growing mango trees in compact planting

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Seven of the 25 provinces reported banana plant cultivation on at least 1 000 ha of lands. Four of these provinces were situated in the Plains Zone. Kampong Cham led other provinces with 5 000 ha of banana plants.

Figure 4.20 Top provinces for area planted to bananas in compact planting.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Cashew

In the edible nuts category, cashew accounted for 17 percent (60 000 ha) of all land parcels under permanent crops, with the highest compact planting reported in Ratanak Kiri (18 000 ha), Kampong Thom (14 000 ha), Kampong Cham (10 000 ha), and Kratie (8 000 ha). Tbong Khmum, Stung Treng, and Koh Kong also reported significant cashew cultivation.

Figure 4.21 Top provinces for land area planted to cashew in compact plantings

Source: NIS, Census of Agriculture in Cambodia 2013

Oil Crops

Oil crops accounted for 4 percent (14 491 ha) of all land used for permanent crops, and consisted primarily of coconut trees, sugar palm and oil palm. The census distinguished between the oil palm and the sugar palm, as the sugar palm tree was used for many purposes, including processing palm sugar, edible oil, etc. Svay Rieng province accounted for 44 percent of the total land used for oil crops

in compact plantations in the country, including coconut (2 400 ha), sugar palm (2 200 ha), and oil palm (1 800 ha).

Figure 4.22 Area planted to major oil crops

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Spices and Aromatic Crops

For the permanent crops, black pepper cultivation accounted for 90 percent of the 6 300 ha devoted to spices and aromatic crops throughout the country. Tbong Khmum, Kratie and Koh Kong were the three leading provinces for black pepper cultivation in compact planting, with Tbong Khmum accounting for 90 percent (5 224 ha) of total black pepper cultivation.

Figure 4.23 The three top provinces for planting pepper in compact plantings

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Rubber

Rubber accounted for almost 24 percent of the total area under permanent crops in Cambodia. As the most valuable among the tanning crops, rubber was cultivated primarily in large industrial plantations though household agricultural holdings were also engaged in rubber cultivation.

The main rubber-producing provinces were: Tbong Khmum (46 000 ha), Kampong Cham (13 000 ha), Kratie (11 000 ha) and Ratanak Kiri (5 400 ha).

Figure 4.24 Top provinces for planting of rubber in compact plantations

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Non-Food Crops

Bamboo, used for many purposes including house building, furniture and cooking, was the leading non-food crop with a compact planting area of 3 100 ha. Svay Rieng accounted for 57 percent of the total compact planting of bamboo followed by Tbong Khmum (17 percent).

Scattered, Permanent Crops

Along with permanent crops in compact plantations there were also scattered, permanent crops planted throughout the country. These scattered crops, including shrubs and trees, were primarily located within homesteads or on separate agricultural land. Scattered crops provided economic benefits for poor agricultural households in terms of food for personal consumption or income generation. Although the exact land area under scattered crops could not be accurately counted, it was possible to determine an estimate for the number of trees: 300 000 scattered orange trees, 133 000 scattered lime and lemon trees, 110 000 grapefruit/pomelo trees, 14 000 kaffir lime trees, and 6 000 tangerine trees. The national average number of scattered orange trees was 20 trees per parcel of land, and the highest recorded average was found in Oddar Meanchey with 62 orange trees per parcel. Other provinces with higher average numbers of scattered trees per parcel than the national average were Koh Kong (42 trees per parcel), Pursat (35 trees per parcel), Battambang (28 trees per parcel) and Pailin (21 trees per parcel). Scattered cultivated fruit trees included 10 million banana plants, 8 million scattered mango trees, 5 million scattered pineapple plants, 2 million scattered custard apple trees, and 2 million

scattered jackfruit trees.

In the category of edible nuts, there was an estimated 3 million scattered cashew trees, 2 million lotus plants, and 282 000 betel nut palm trees. The scattered oil crop was dominated by coconut, with 4.5 million trees (primarily in Kampot and Kampong Thom), 800 000 sugar palm trees, and 500 000 oil palms. Scattered spices and aromatic crops included 97 000 tamarind trees, 61 000 black pepper plants, and 15 000 wood apple trees. Scattered rubber trees totalled 1.9 million, primarily in Tbong Khmum, Kampong Thom, Kampot, Kratie, Mondul Kiri, Preah Sihanouk and Stung Treng.

Figure 4.25 Number of scattered fruit trees in Cambodia for most common species
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

The average number of scattered orange trees recorded in the country was 20 trees per parcel. Five provinces had higher average numbers of scattered orange trees than the national average. The highest recorded average number of scattered trees per parcel was noted in Oddar Meanchey at 62 trees; followed by Koh Kong (42 trees per parcel), Pursat (35 trees per parcel), Battambang (28 trees per parcel) and Pailin (21 trees per parcel). Note that some of the household agricultural holdings had bigger parcel areas so that high, average numbers of scattered orange trees was possible.

The list of scattered cultivated fruit trees in the country included 38 specific cultivated fruit trees. Among these, 10 million banana plants were scattered in all provinces. Banana plants grow in groups known as ‘hills’ and with three to five stems per hill. If the 10 million banana stems were grouped into hills, it would be the equivalent of 2 to 3 million banana hills.

Scattered mango trees totaled almost 8 million, an average of 16 scattered mango trees per parcel. Other scattered permanent crops reported in the millions were pineapple (5 million plants), custard apple (2 million trees) and jackfruit (2 million trees).

Pineapple was classified as a temporary crop in Cambodia. In other Asian countries, however, pineapple is considered a permanent crop. Like banana plants, pineapple also grows in hills. Hence, if one hill has an average of five pineapple plants, then the 4 million scattered pineapple plants would be only about 1 million scattered pineapple hills.

Cashew, the most important edible nut in the country, was reported to be in scattered planting totalling some 3 million trees. Other scattered edible nuts were lotus plants (around 2 million) and betel nut trees (282 000).

Figure 4.26 Number of scattered edible nut trees/plants in Cambodia by species.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Scattered oil crops estimated in large numbers were coconut with 4.5 million trees (around 14 scattered trees per parcel), 800 000 sugar palm trees (10 trees per parcel) and some 500 000 oil palms (332 trees per parcel). Scattered coconut trees were reported in the largest number in Kampot (940 000 trees); followed by Kampong Thom (500 000 trees).

Figure 4.27 Top provinces growing scattered coconut trees

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Within household agricultural holdings, scattered spices and aromatic crops were reported as 97 000 tamarind trees, 61 000 black pepper plants and 15 000 wood apple trees. Takeo province accounted for 20 percent of the total scattered tamarind trees while Tbong Khmum accounted for more than 30 percent of the scattered black pepper plants. (Table 4.54)

Scattered rubber trees totaled 1.9 million (an average of 45 scattered trees per parcel), with large numbers of scattered trees reported in Tbong Khmum, Kampong Thom, Kampot, Kratie, Mondul Kiri, Preah Sihanouk and Stung Treng.

Agricultural Inputs and Services

Equipment and Machinery

Traditional agricultural equipment was used predominately by Cambodia's household agricultural holdings, primarily hoes, sickles, ploughs, harrows and traditional carts. In addition, heavy and modern equipment was used by many households including some 440 000 households which used harvesting machines, 550 000 households used threshing machines, 420 000 households used water pumps, 650 000 households used power tillers, 116 000 households used tractors, 270 000 households used rice milling machines (used after the harvest) and 700 000 used motor vehicles/bicycles and tricycles for transport. Amongst these users of machinery and equipment, the agricultural households tended to own their motor vehicles and bicycles, yet a large amount of agricultural equipment and machinery was rented by farming households from the private sector. Most water pumps were privately owned. Tractors, harvesters, threshers and power tillers were mostly rented. A small amount of equipment and machinery was made available to households by the State (not shown in the figure below).

Figure 4.28 Number of households using various items of equipment and source of items.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 4.29 percentage of machinery and equipment owned by households, rented from private sector and borrowed from Government

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Around 1.5 million households reported using hoes, 1.3 million households used sickles, 0.7 million households used ploughs, 0.7 million used harrows, 0.5 million used cultivators, 0.2 million used rakes and 0.3 million households reported use of traditional carts in agricultural activities.

Use of Fertilizers and Chemicals

Use of both inorganic and organic fertilizers was high in Cambodia with 70 percent of agricultural households reporting use of inorganic fertilizer (synthetic) and around 50 percent reporting use, or preferring use, of organic fertilizers, which are made from animal wastes and plant residues. Around 30 percent of these households also used additional chemicals, including pesticide and/or herbicides. Around 9 percent of agricultural holdings applied fungicides to eradicate fungal disease. Use of inorganic fertilizers was lowest in the Plateau and Mountainous Zone compared to other zones. The largest percentage of households using organic fertilizer was found in the Coastal Zone (61 percent) and the smallest percentage was in the Tonle Sap Lake Zone (less than 44 percent). The Plains Zone had the largest percentage of households using all chemical types (pesticides, herbicides and fungicides). Coastal Zone provinces had the lowest percentage of households using chemicals on their crops. Prey Veng province reported the largest number of households applying fertilizers, both inorganic and organic, to their crops. Takeo ranked second and Kampong Cham ranked third in terms of the most use of inorganic fertilizers followed by Kampong Speu and Kampot. Stung Treng had the smallest number of households (less than 1 000) applying fertilizers of any type to crops.

Figure 4.30 Number of households using various fertilizer and chemicals on at least one crop during the reporting period by Zone.

Figure 4.32 Percentage of organic versus inorganic fertilizer used in the provinces with the highest numbers of households reporting fertilizer use.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Rice Seed

In all regions of the country, agricultural households utilized both high yielding and local varieties of rice seed. At the national level, 1.5 million households used local rice seed compared to 454 000 that used high yielding varieties of rice seed. In general, more household agricultural holdings used local varieties of rice seed than high yielding rice seed varieties. This was observed in all zones. (Table 4.58)

Figure 4.33 Number of households using high-yielding or local varieties of rice seed.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

The clear majority of households with agricultural land holdings produced and used their own rice seed. Approximately 72 percent of agricultural holdings reported using self-sourced rice seed in Cambodia, with the highest rates occurring in the Coastal and Plateau and Mountainous Zones (85 and 80 percent respectively).

Figure 4.34 Number of households sourcing rice seeds from various sources.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 4.35 Percentage of agricultural holdings using various sources of rice seed by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Agricultural Extension Services

Four distinctive groups (government, private companies, non-government organizations and local associations) offered agricultural extension services to agricultural households in terms of promoting productivity, increasing food security, improving rural livelihoods and promoting agriculture as a means of economic growth. The Government was the main source of extension services.

Figure 4.36 Number of agricultural households making use of various sources of extension services by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 4.37 Percentage of agricultural households making use of different sources of extension services by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

At the national level, approximately 27 percent of households reported using extension services provided by government. Approximately 11.5% of the household agricultural holdings with separate agricultural lands reported making use of private companies as a source of extension services, with almost the same percentage accessing extension services from NGOs.

Figure 4.38 percentage of total household agricultural holdings with separate agricultural lands using extension services by type of extension service and zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Availability of Credit

Thirty-one percent of households engaged in growing crops availed of micro-finance institutions to obtain credit. Around 21 percent of households relied on their friends and relatives to borrow money. Twenty percent of households accessed credit and loans from a bank.

Figure 4.39 Number of households reporting use of various sources of credit

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

A significant number of households did not make use of loans and credit from any source, mostly due to such services being unavailable in their locations or, if available, agricultural households were not aware of their availability.

The proportion of agricultural households using loans/credit was higher in the Plains Zone and Tonle Sap Lake Zone compared to the other zones. Micro-finance was the main source of loans for these two zones as well as those households in the other two zones. The next sources of credit/loan that the households in all zones used were friends/relatives and banks. However, the third choice for the households in the Tonle Sap Lake Zone for obtaining credit was the moneylender.

Agricultural Information

The mass media (television and newspapers) were the most important sources of agricultural information. The extension services provided by the government, as well as information sharing among farmers themselves were other important sources of information. Around 1.1 million households reported receiving agricultural information from the radio and around 1 million from the television.

Figure 4.40 Number of households accessing agricultural information from various sources by zone.

Source: NIS, Census of Agriculture in Cambodia 2013

Market Access

70 percent of agricultural households in Cambodia were aware of the location of their nearest market for agricultural produce, 22 percent of those households had never used the market to sell their harvested crops. Awareness of the nearest market for agricultural produce was highest in the Coastal Zone. Distance from markets was the greatest issue for households in the Tonle Sap Lake zone and plateaus and mountainous areas, which recorded the highest percentage of household that had to travel 1-2 hours to reach their nearest market. A small percentage of households in both areas also travelled more than two hours to reach a market.

Figure 4.41 Percent of households with agricultural holdings reporting various travel times to the nearest market by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Fifty-six (56) percent of the agricultural households with knowledge of the nearest market reported to have accessed the market in less than 30 minutes. Among the various zones, more or less 50-60 percent of the households in all zones travelled to the nearest market in less than 30 minutes. About one-third of the households in all zones reported to have reached the nearest market in over minutes and less than one hour. A higher percentage (between 13%-15%) of those traveling from their homelot to the nearest market in 1-2 hours were recorded in Tonle Sap Lake Zone and Plateau Zone since these two zones had agricultural lands located far away from the market. These two zones also reported some percentage (3-7%) of agricultural households traveling from their house/holding to the nearest market in more than 2 hours.

Nine out ten households with agricultural holdings brought their harvested agricultural crops to the nearest market using vehicle/motorcycle/bicycle/tuktuk. More or less 6% of the households used other means such as draught animals (cattle, buffalo, etc.) and boat/raft. Four percent of the households walked from their house or holding to the nearest market with their agricultural produce.

Community Organizations

A small percentage of agricultural households reported membership in farming organizations and associations. Only six percent of agricultural households were members of farmers' associations; four percent were members of farming cooperatives, and just two percent had joined a farmers' water-user community. Membership of such groups was highest in the Tonle Sap Lake Zone where 8 percent of households in the region were members of some type of group.

Figure 4.42 percentage of household agricultural holders reporting membership of a farming organization by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Chapter 5 – Raising of Livestock and Poultry

Livestock and Poultry

Raising livestock and poultry was the second most important agricultural activity undertaken by agricultural households following crop cultivation and, therefore, played a key role in supporting livelihoods and providing income in rural households. Around 75 percent (1.6 million) of all household agricultural holdings in Cambodia raised livestock and/or poultry at the time of the census enumeration. The largest number of households raising livestock and poultry was recorded in the Plateau and Mountainous Zone (86 percent of households) followed by the Coastal Zone (85 percent), the Tonle Sap Lake Zone (78 percent), and the Plains Zone (75 percent). At the provincial level, the largest number of households raising livestock and poultry was reported in Prey Veng with 178 000 households, accounting for 11 percent of all households in the Plains Zone. Other provinces with at least 100 000 households reporting the presence of livestock and poultry were Takeo (162 000 households), Kampong Speu (134 000), Kampong Cham (114 000), Svay Rieng (106 000), Kampong Thom (104 000) and Kampot (103 000).

Figure 5.1 Number of household agricultural holdings raising livestock or poultry by province.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.2 Percentage of households raising large livestock

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.3 Number of households keeping large livestock by zone

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Eighty-five percent of household agricultural holdings nationwide reported raising poultry, 66 percent reported raising large livestock, and 28 percent reported raising small livestock. Preference of households for raising large livestock over small livestock was evident from the results of the census, and many households kept a mix of both livestock and poultry. In the case of households raising large livestock, 86 percent kept between two and nine large animals, such as cattle and buffalo. Just 3 percent of households kept 10 or more large animals. The Plains Zone had the largest number of households (more than 200 000) raising small livestock, such as pigs, goats, etc. These households kept small livestock in large numbers, 3-29 animals, and small numbers, 1-2 animals.

Figure 5.4 Number of households keeping small livestock by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.5 Percentage of households raising small livestock

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Almost 70 percent of households that raised poultry reported between 25 and 499 chickens, ducks etc., and 30 percent reported between 1 and 24 birds. Only 0.5 percent of households raised 500 or more fowl.

Cattle, Buffalo and Pigs

The most common large livestock raised in agricultural households were cattle and buffalo, though cattle were six-times more numerous than buffalo, and cows were 10 percent more numerous than

bulls. With an estimated 3.2 million cattle throughout the country, there was an average of three animals per household raising cattle. The Plains Zone accounted for 41 percent of the total number of cattle in the country (1.3 million), followed by the Tonle Sap Lake Zone with some 900 000 cattle (29 percent), the Plateau and Mountainous Zone with 700 000 cattle, and the Coastal Zone with around 300 000. Kampong Speu province reported the largest number of cattle (364 000) followed by Takeo (336 000) and Prey Veng (311 000). Eighty percent of cattle raised in Cambodia were reported to be local breeds and 11 percent were reported to be hybrid or imported breeds.

Figure 5.6 Number of cattle kept by household agricultural holdings by province.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.7 Number of buffalo kept by household agricultural holdings by province.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Household agricultural holding reported a total of some 519 000 buffalo with 41 percent located in the

Plains Zone, followed by 35 percent in the Tonle Sap Lake Zone and 18 percent in the Plateau and Mountainous Zone. At the provincial level, the largest number of buffalo was reported in Svay Rieng (105 000) followed by Pursat (61 000) and Kampong Thom (52 000).

Figure 5.8 Percentage distribution of buffalo by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Cattle and buffalo were reared for three main purposes in Cambodia: (a) to sell (1.3 million head or 40 percent), (b) use as draught animals (37 percent), (c) breeding purposes and sale at a later date (17 percent). Buffalo, due to their reported difficulty in breeding compared to cattle, were predominately kept as draught animals by agricultural households.

Figure 5.9 Number of pigs kept by household agricultural holdings by province.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

The number of pigs raised in agricultural holdings totalled 2.2 million and accounted for 98 percent of all small livestock raised in the country. Agricultural households in the Plains Zone reported raising the majority of pigs (49 percent). Local breeds accounted for 74 percent of all pigs and hybrid or

imported breeds accounted for around 19 percent of the total. Takeo accounted for the largest number of pigs raised by households with a total of 228 000 pigs reported in the province.

Pigs were mostly raised for live sale. A small number of pigs were kept for breeding purposes or slaughtered for sale of their meat.

Chickens and Ducks

Chickens and ducks, an important source of protein, were the most common poultry raised by agricultural households with an estimated 45 million chickens and 11 million ducks reported at the time of enumeration. Takeo led all other provinces with almost 5 million chickens reported within households. Prey Veng reported the most ducks (1.9 million) followed closely by Takeo and Kampong Cham with each reporting 1.8 million ducks.

Figure 5.10a Number of poultry held by household agricultural holdings by kind and age
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.10b Number of poultry other than chickens and ducks by kind and age.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Adult chickens (10 days or more) accounted for around 57 percent all chickens recorded during the census period. Adult ducks accounted for 82 percent of the duck population.

Other birds and poultry reported by households included 70 000 swallows (predominately in Preah Sihanouk and Kampot), 46 000 quails (predominately in Battambang and Phnom Penh), 12 000 turkeys, and 18 000 other fowl species.

Figure 5.11 Top provinces for chicken production showing numbers of birds.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

The vast majority of agricultural households (90 percent) kept their livestock and poultry within their homesteads, dedicating a portion of the space around, or beneath their homes to raising livestock and

poultry. Only 14 percent of households provided grazing land or forage grass for their livestock and poultry. A smaller number of households dedicated space within their cropland for livestock and poultry.

Figure 5.12 Top provinces for duck production showing numbers of birds.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Disposal of Livestock and Poultry

Disposed animals were those sold or otherwise disposed of, such as slaughter at an abattoir, butcher or meatpacking plant. Alternatively, an animal given as a gift, for payment of a service or other reasons, including animals donated for festivals and other community events. Cattle disposed of during the 12 months prior to the census enumeration totalled 406 000 animals with 78 percent of that figure involving cattle sold live. The Plains Zone accounted for 48 percent of the total cattle disposed of, followed by 27 percent from the Tonle Sap Lake Zone and 19 percent from the Plateau and Mountainous Zone.

Figure 5.13 Number and percentage of cattle disposed of in the past year according to nature of disposal.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

As well as cattle sold live, another 6 percent died, 4 percent were reported lost, (including to theft), 5 percent were slaughtered for personal consumption and for sale as meat, 3 percent were given as gifts, wedding etc., and 4 percent were disposed of by other means, such as in payment for debts, etc.

Kampong Speu reported the largest number of cattle sold live (44 000), followed by Takeo (40 000), Prey Veng (29 000), Siem Reap (25 000), Kampong Cham (22 000), Kandal (22 000), and Kampot (21 000).

A total of some 67 000 buffalo were disposed of during the same 12-month period with 55 percent sold live and around 35 percent disposed of to pay debts, bartered for food, etc. Svay Rieng province sold the largest number of buffalo live (6 000) followed by Kampong Chhnang (around 6 000), Prey Veng (5 000), Pursat (4 000) and Tbong Khmum (4 000).

Figure 5.14 Number and percentage of buffalo disposed of in the past 12 months according to the nature of disposal.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Around 1.3 million pigs were disposed of during the 12-month period covered by the census, with 90 percent sold live. Around 7 percent died and the remainder slaughtered for consumption, sale of meat, given as donations/gifts, or lost due to theft. The majority of pigs (42 percent of the total) were reported in the Plains Zone, and Kampong Speu was the leading province for sale of live pigs (214 000). Takeo and Siem Reap also reported sales of live pigs in excess of 100 000 animals each.

Figure 5.15 Number of pigs disposed of during the past 12 months by province.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.16 Number and percentage of disposed pigs in the past 12 months by nature of disposal.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Around 25 million chickens were disposed of during the same 12-month period, with 47 percent sold live in markets and elsewhere. Around 22 percent were slaughtered for consumption or sale of meat, another 22 percent died from sickness and 4 percent were lost. Kandal reported the largest number of

chickens sold live (2.2 million), followed by Kampong Speu (1.2 million) and Takeo (1.1 million).

Agricultural households in Kampot reported almost 600 000 chickens slaughtered for consumption or sold as meat, and Takeo and Siem Reap each reported more than 500 000 chickens disposed in this manner.

Figure 5.17 Number and percentage of disposed chickens in the past 12 months by nature of disposal.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.18 Number and percentage of disposed ducks in the past 12 months by nature of disposal.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Around 3.3 million ducks were disposed during the 12 months of the enumeration period with around 50 percent (some 1.7 million) sold live, 12 percent slaughtered for personal consumption or sale of meat, and 18 percent having died from disease, etc. Prey Veng reported the largest number of ducks sold live (around 540 000) and the largest number of ducks succumbing to disease (122 000). Svay Rieng reported the largest number of ducks slaughtered for personal consumption or sold for meat (63 000).

Poultry Disease

Prey Veng had the largest number of chickens reported as dying from disease (around 577 000). Kampong Speu and Siem Reap each reported more than 500 000 chickens dying from disease. Chart 4.11c shows the provinces where large numbers of chickens died from disease or were slaughtered as a result.

Figure 5.19 Number of chickens slaughtered because of disease or died by province.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 5.20 Number and percentage of households reporting use of various veterinary services.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Equipment and Facilities

Around 11 000 agricultural households reported using incubators, heaters and generators in the raising of livestock and poultry, with around 90 percent reporting ownership of generators and 92 percent owning incubators. Around 40 percent of households reported receiving veterinary extension services in the raising of livestock and poultry, 60 percent received free vaccinations for their livestock and poultry, and a further 25 percent administered their own medicine, vitamins, etc., to their animals. Only 4 percent of households raising livestock and poultry reported membership in community groups or associations involved with raising livestock. Most households raising livestock never considered membership of such groups due to lack of understanding of their usefulness.

Chapter 6 – Fishing and Aquaculture

Fishing and aquaculture constituted an alternate or additional economic activity for household agricultural holdings in Cambodia. Most households engaged in fishing were located near the available fishing grounds in the Coastal Zone and Tonle Sap Lake Zone, while 90 percent of all household agricultural holdings that reported engaging in fishing did so for the purpose of personal consumption.

Fishing

For the purposes of the census, fishing was defined as catching fish and other sea and river species: molluscs (snails, clams, mussels), crustaceans (crab, prawn/shrimp), and echinoderms, (urchins and sea cucumbers) in rivers, coastal waters and other water bodies with or without use of boats and specialized equipment.

The core module of the census recorded a total of 525 952 households engaged in fishing and aquaculture activities from the total population of 2.6 million households covered by the census. This number was reported for fishing and aquaculture activities conducted during the 12 months prior to the conduct of the census core module in April 2013. However, a larger figure of 680 000 households engaged in fishing was recorded in the census supplementary module conducted in November-December 2013. This disparity was due to flooding in the last few months of 2013. At that time, many provinces were flooded and normal agricultural activities were not possible in some areas. This situation prompted many agricultural households to turn to fishing as an alternative source of food and income. See Table 5.1.

Table 6.1 Number and percent of households engaged in fishing and aquaculture: 2012-2013

Fishing/Aquaculture Activities	Total households		Engaged in fishing		and/or engaged in aquaculture	
	Number	Percent	Number	Percent	Number	Percent
Total	525 952	100.0	462 457	87.9	80 632	15.3
Solely aquaculture activity	5 282	1.0	-	-	5 282	6.6
Aquaculture with crop cultivation/raising of livestock/ poultry	63 495	12.1	-	-	63495	78.7
Combined capture fishing and aquaculture	2 893	0.6	2 893	0.6	2 893	3.6
Combined capture fishing, aquaculture crop cultivation/ raising of livestock/ poultry	8 962	1.7	8 962	1.9	8 962	1.1
Capture fishing with crop cultivation/raising of livestock/ poultry	399 639	76.0	399 639	86.4	-	-
Solely capture fishing	50 963	9.7	50 963	11.0	-	-

Source: NIS, Census of Agriculture in Cambodia Core Module 2013. Note: These data were taken from census Form A (List of Households), which was administered in all households during the core module census in April 2013 using the past 12 months prior to census taking as the reference period.

Of the total number of households engaged in fishing, the majority combined fishing with crop cultivation and/or raising livestock and poultry, as well as other aquaculture activities. Only 11 percent of households that were engaged in fishing relied on capture fishing as their sole economic activity.

More households were involved in fishing and other agricultural activities than the number involved solely in fishing and other aquaculture activities.

Based on the number of households, the Plains Zone and the Tonle Sap Lake Zone had more households engaged in fishing than the Coastal Zone. This was due to the smaller number of households located in coastal areas compared to other regions. Prey Veng province reported the largest number of households engaged in fishing activities (12 percent or 82 000 households). Other provinces with more than 50 000 agricultural households engaged in fishing included Siem Reap, Takeo, Svay Rieng and Kampot.

Figure 6.1 Number of household agricultural holdings engaged in fishing by province.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Percentage of agricultural households engaged in fishing by main purpose for of fishing.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

More than 90 percent of agricultural households in Cambodia that were engaged in fishing did so mainly to meet their household consumption needs. Fishing primarily for household consumption was

reported in almost all provinces except the coastal provinces of Koh Kong, Preah Sihanouk and Kep.

Figure 6.4 percentage of agricultural households engaged in fishing by type of fishing gear.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Netting was the most common technique used by agricultural households engaged in fishing with 60 percent of households using lift and push nets and 55 percent using cast nets. Small fishing traps were used by 44 percent of agricultural households to confine fish in areas where they could be easily caught. Hand fishing techniques, such as spearing, were used by 35 percent of agricultural households. Gill nets and rods were also used. Use of fishing boats was reported by only 13 percent of households involved in fishing. Note that around 87 percent of households did not report anything regarding the use of a boat. Three types of boats were used: traditional boats without motors, motorized boats, and improvised vessels such as rafts, etc. Preference for the use of traditional boats was expressed in almost all provinces except for those of the Coastal Zone.

Figure 6.5 Percentage of households engaged in fishing activities by main purpose and province.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Aquaculture

Aquaculture referred to the cultivation, under controlled conditions, of aquatic products such as fish, crustaceans, seaweed and other aquatic resources in seas, lakes, rivers and swamps, or other bodies of water such as ponds, pens and seaweed cultures. Around 26 000 households with agricultural holdings also engaged in aquaculture practices, representing just 1.2 percent of all household agricultural holdings in Cambodia.

Ninety percent of the household agricultural holdings engaged in aquaculture activities were involved in breeding or rearing aquatic plants or animals in natural or artificial ‘pond culture’ enclosures. Just 3 percent were involved in pen culture (a net enclosure from above water level down to the floor of the river, lake, sea, etc.) and another 3 percent were involved in cage culture (a net enclosure in open water similar to an inverted mosquito net suspended in place by floating structures or suspended by stakes in four corners).

Figure 6.6 percentage of aquaculture area by type of aquaculture.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

The total area devoted to aquaculture in household agricultural holdings was estimated to be just 304 ha, with pond culture accounting for the largest share (73 percent) followed by pen culture (16 percent) and rice-fish culture (10 percent). Rice-fish culture involves stocking paddy fields with fingerlings in order to obtain a fish harvest in addition to paddy rice. Prey Veng reported the largest area devoted to pond culture followed by Svay Rieng and Kampot. Ninety-four percent of all pond culture involved freshwater, as did the majority of cage culture.

Sixty-four percent of fish hatcheries and nurseries were operated in freshwater and the remainder in brackish water. The main species cultured and reared by agricultural households varied from fish to crocodiles.

Table 6.2 Number and Percent of Households with Aquaculture Activities, by Type of Aquaculture Activity and Type of Water Used: 2013

Type of Aquaculture	Number of households with aquaculture activities	Percentage of households with aquaculture activities by water type		
		Marine water	Brackish water	Freshwater
Pond Culture	24,555	1.89	3.69	94.43
Pen Culture	839	61.03		38.97
Cage Culture	768	0.13		99.87
Rice-Fish Culture	155			100.00
Hatchery/Nursery	56		35.71	64.29
Other Aquaculture	103	34.95		65.05

Source: Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Most fish culture is conducted within homesteads in the form of backyard aquaculture and the average area farmed was 100 square metres (m²). The largest area, on average, per aquaculture farm was devoted to prawn and shrimp culture (505 m²). An average area of 265 m² was devoted to crab culturing

and 292 m² to raising crocodiles. Prey Veng province led in terms of prawn and shrimp culture, and Takeo led in terms of crab culture.

The most commonly used equipment and facilities reported by those engaged in aquaculture was boats (48 percent), important for raising and harvesting aquatic species, and road transport, which was required to take stocks to markets. Aerator machines, nets, and food processing facilities were also used. Seventeen percent of households engaged in aquaculture reported using buildings and facilities specifically for aquaculture activities.

Table 6.3 Number of Household Members in Household Aquaculture Activities by Sex, Age and Frequency of Involvement: 2013

Frequency of Involvement in Aquaculture	All Members			
	Total	5-14 years	15-17 years	18 years & older
All household members working in aquaculture (own account)	86,410	7,571	8,443	70,396
Full-time	26,851	1,136	1,875	23,840
Part-time	30,685	3,258	2,890	24,537

Source: Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Some 86 000 household members reported being engaged in household aquaculture activities inside agricultural holdings with 31 percent working full-time with aquaculture, and 80 percent of that number aged 18 years and older. However, 19 percent were younger than 18 years, including 9 percent reported as younger than 15 years old. More females than males worked in household aquaculture activities with 94 males to every 100 females engaged in such work.

Table 6.4 Number of Hired Workers in Household Aquaculture Activities by Hours Worked and Frequency of Involvement: 2013

Frequency of Involvement	All Hired Workers			
	Total	21 hours or less	22-49 hours	50 hours and more

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

For every four household members working in aquaculture there was one hired worker, and of the total of 21 861 hired workers reported, 84 percent worked 21 hours or less per week, and 64 percent were male.

Around 32 percent of households agricultural holdings that were engaged in aquaculture activities accessed some form of social protection program, receiving free training (81 percent), advice regarding aquaculture (73 percent), free fry/fingerlings, etc., and loans (18 percent). Around 5 percent of households engaged in aquaculture had members participating in community fisheries and aquaculture organizations.

Chapter 7 – Supplemental Economic Activity in Agricultural Households

Agricultural households in Cambodia supplemented their economic activity both within their holdings through forest-related activities, handicrafts, microbusiness, and outside their holdings by working in other agricultural holdings and jobs in the services sector.

Figure 7.1 Percentage of total households with agricultural holdings engaged in forest-related activities by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Of the total 2.1 million household agricultural holdings in Cambodia, 38 percent engaged in forest-related activities, such as gathering firewood, harvesting bamboo, charcoal production and cutting of sandalwood and other forest timber. The proportion of households utilizing the forest was greatest in the Tonle Sap Lake Zone (45 percent), Coastal Zone (43 percent) and Plateau and Mountainous Zone (42 percent), meaning that nearly half of all agricultural households in these areas relied on nearby forest to supplement economic activity.

Of the total number of agricultural households engaged in forestry-related activities, 97 percent gathered firewood and/or harvested bamboo, and around 30 percent gathered wild fruits and other edibles to augment their diet.

Prey Veng led other provinces in the number of households gathering firewood and harvesting bamboo (106 000), as well as the gathering of wild fruits and other edible forest items (47 000). Gathering firewood and harvesting bamboo were activities also reported by more than 50 000 households in each of the following provinces: Kampong Cham, Kampong Thom, Siem Reap, Kampong Speu, Tbong Khmum, Kampot and Takeo. Takeo also reported some 32 000 households gathering wild fruits and other edibles in forests.

Figure 7.2 For those households engaged in forest-related activity, the percentage of households engaged in each type of forest-related activities zone.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Figure 7.3 Number of agricultural households engaged in handicraft activities by zone.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Around four percent of all agricultural households engaged in handicraft work, such as weaving baskets and mats (60 percent), and production of yarn and items of clothing (40 percent). The largest number of households engaged in basket and mat weaving was reported in Takeo, Kampong Cham and Siem Reap.

Micro-business

Amongst all the household agricultural holdings, some 11% of households reported involvement in some type of business activity (micro, small or medium in scale). These businesses included light manufacturing of clay bricks and tiles, tailoring, small-scale trading and retail sales (phone cards, household utilities, food, etc.), and local micro-lending. The most popular form of business was micro-trading (pursued by nearly 50 percent of households involved in business activities) followed by food businesses (cooking, selling, processing, preserving) which was pursued by over 30 percent of households.

Figure 7.4 Top four provinces in terms of the number of agricultural households operating business activities.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Other Economic Activities of Agricultural Household Members

Around 70 percent of all agricultural household members aged 5 years and older were involved in activities within their holdings that constituted their primary economic activity – with males exceeding females in number by 3 percentage points. A further 1.2 million household members, aged 5 years and older, were engaged in primary economic activity outside their holdings. This economic activity included 10 percent employed in the service sector, such as domestic workers in other households, waiting staff in hotels and restaurants; 7 percent in other industries such as manufacturing, trading, etc., and 5 percent involved in agricultural activities (fishing, forestry, handicraft) in other households.

Phnom Penh accounted for the largest number (24 percent) of agricultural household members working in the service sector. Overall, there were slightly more males (0.4 percent) than females employed in service industry positions. On the other hand, more females (6 percent) than males were engaged in manufacturing and trading industries.

Chapter 8 – Agricultural Households and Population

Households

Whereas the estimated number of households in Cambodia in 2013 totalled some 3.3 million in the NIS-ICPS 2013, the agricultural census counted a smaller figure of some 2.6 million households. This disparity was due to the CAC enumeration excluding highly urbanized areas of Phnom Penh, as well as some extremely remote areas and restricted areas in some provinces that were not reached by the enumerators. The households that were counted reported some 8.5 million people (around 63 percent) of the total population of the country in 2013.

Around 82 percent of the total number of households counted in the agricultural census reported engaging in crop cultivation and/or raising livestock and poultry within their own agricultural holdings. According to the census, the Plains Zone accounted for 45 percent of the population living within agricultural holdings, the Tonle Sap Lake Zone accounted for 33 percent, the Coastal Zone 8 percent, and the Plateau and Mountainous Zone 14 percent.

Figure 8.1 Number and percentage of households with agricultural holdings by zone.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Prey Veng had the largest percentage of people living within agricultural holdings while Kep had the lowest. Prey Veng, Takeo, Kandal, Kampong Speu, Siem Reap, Battambang, Kampong Cham and Kampong Thom were the top eight most populous provinces with 500 000 or more people within agricultural households. There were almost equal numbers of males (50.1 percent) and females (49.9 percent) within the agricultural household population, though male-headed households exceeded female-headed households by 52 percent to 48 percent. Female-headed households, on the other hand, had more female members (59 percent) than male members (41 percent).

Figure 8.2 Top provinces for population within the agricultural households

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Population Age Groups

Males and females aged between 10 and 19 years old constituted the largest age group (around 23 percent) of all people living within agricultural households, followed by the 20 to 29 years old age group (around 20 percent). There were 2 percent more males than females in the 10 to 19 years age group, but almost equal numbers in the 20 to 29 years age group. Agricultural household members aged below 10 years constituted some 15 percent of the total population in agricultural holdings. The percentage of males and females in agricultural holdings decreased overall in the 30 to 39 years age group, and the number of males to females begins to decrease in that age bracket and continues in successive older age brackets.

Figure 8.3 Sex and age distribution of the population within agricultural households.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Members of agricultural holdings recorded a mean age of 28.8 years. The highest mean age recorded was in Kampong Cham at 31.6 years and the lowest 22.9 years in Mondul Kiri.

Dependency Ratio

Sixty-eight percent of all members of agricultural households were economically active (i.e. aged 15 to 59 years). The percentage of dependent household members, those younger than 15 years and those 60 years and older, was computed at 32 percent of the total population of the households, meaning the dependency ratio in all households was 0.48 on average. The dependency ratio is calculated from the sum of the household population less than 15 years and over 60 years, expressed as a percentage of economically active population between the ages of 15 and 60 years. The dependency ratio was markedly higher in the Plateau and Mountainous Zone and lowest in the Plains Zone. In contrast, the old age dependency ratio was highest in the Plains Zone and lowest in the Plateau and Mountainous Zone.

Table 8.1 Dependency ratio in the households with agricultural holdings by zone: 2013

Zone / Age Group of members	All households		
	Number	Dependency Ratio*	Old age dependency ratio**
Cambodia	8563207	0.48	0.11
Plains Zone	3876473	0.45	0.12
Tonle Sap Lake Zone	2842351	0.49	0.10
Coastal Zone	638304	0.49	0.11
Plateau & Mountains	1206079	0.54	0.09
*Dependency ratio is the ratio of number of persons less than 15 years and over 59 years to the number of persons aged 15 to 59 years.			
**Old age dependency ratio is the ratio of the number of persons over 59 years to the number of persons aged 15 to 59 years.			

Source: NIS, Census of Agriculture in Cambodia Supplementary Module 2013

Relationship to Household Head

For all households, the heads composed 24 percent of the total population. The proportion of the male heads (36.8 percent) to the total male populations was greater than the proportion of the female heads (10.3 percent) to the total female population. On the other hand, only 4 percent of the total male populations were considered spouses (not household head) compared to the 35 percent of the female populations reported as spouses of the male household heads. The sons and daughters composed the highest percentage of the total population, which was reported at 49 percent. From this, the sons consisted of 50 percent of the total male populations while 47 percent of the female population was accounted for as daughters.

Education Attained

Just 9.4 percent of the total population aged 5 years and older within agricultural households completed Grade 5 in school, and only some 4 percent reported completing Grade 12 (though without certification). Just 0.6 percent reported receiving a lower education certificate and 1.1 percent reported

receiving a higher education certificate. Similarly low figures were reported for those who said they held a bachelor's degree. Ten percent of the male population aged 5 years and older in agricultural households reported completing Grade 7, whereas 10 percent of females in the same population completed only Grade 2.

Generally, few members of agricultural households completed higher education and participation was lower for females than males. For example, 3 percent of females completed Grade 12 compared to 5 percent of males; 0.6 percent of females reached college or university compared to 0.9 percent of males; 0.4 percent of females attained a primary degree compared to 0.8 percent of males.

Marital Status

Some 52 percent of household agriculture holdings comprised of married members while 6 percent were widowed, 2 percent were divorced or separated, and 40 percent were unmarried and not living with a partner.

More female heads of households had never married or lived with a partner (42 percent) compared to male heads of households that were unmarried or not living with a partner (39 percent). More female heads of households had been widowed (17 percent compared to 3 percent for male heads of households), and more women had divorced or separated (3 percent compared to 2 percent for male heads of households).

Chapter 9 – Food Security of Agricultural Households

Almost 2 million households (93 percent of the total) with agricultural holdings responded to questions regarding their food security. The basic foods eaten by households consisted of the following: (a) rice and other cereals; (b) vegetables; (c) meat and meat products; (d) fish and other seafood; (e) fruits; (f) root crops; (g) edible beans and pulses; (h) edible nuts.

Figure 9.2 Average number of days in one week each food type is consumed on average for the entire population of household agricultural holdings.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

More than 96 percent of households consumed rice (Cambodia's main staple food) and vegetables on average five days per week. Meat and meat products were consumed on average four days per week. Average consumption of fish and other seafood was also four days per week for 84 percent of responding agricultural households. Almost 70 percent of households consumed fruit two days per week. Also twice per week: 46 percent of households consumed root crops; 34 percent edible beans and pulses, and 18 percent consumed edible nuts.

From the perspective of the entire population of agricultural households, the average number of days each food type is consumed drops according to the actual percentage of the households consuming each food type. Hence, for all agricultural households, rice and cereals were consumed on average on 6.9 days per week; vegetables 4.8 times per week; fish 3.5 days per week; meat and animal products on 3.75 days per week; fruits on 1.7 days per week; root crops 1 day per week; beans and pulses on 0.7 days; and nuts 0.4 days per week during the week prior to survey.

Households in the Tonle Sap Lake Zone and Coastal Zone consumed fish and other seafood one additional day (five days per week) on average, compared to households in other zones. Households in the Plateau and Mountainous Zone consumed meat and meat products on day less on average (three days per week) compared to all other zones. Households in the Plains and Coastal zones ate more fruit in a week (three days) compared to other zones.

Table 9.2 Proportion of households reporting consumption and average number of days reported in consuming basic foods in the last seven days prior to census taking.

Basic Food Types	Percentage of households in Cambodia	Average Number of Days eaten in the last 7 days				
		Cambodia	Plains Zone	Tonle Sap Lake Zone	Coastal Zone	Plateau and Mountain Zone
Rice and Cereals	99.9	7	7	7	7	7
Vegetables (leafy, fruit-bearing and other)	96.4	5	5	5	5	5
Fish and other aquatic resources	96.0	4	4	5	5	4
Meat and animal products (egg etc.)	83.7	4	4	4	4	3
Fruits	69.3	2	3	2	3	2
Root crops	46.0	2	2	2	3	2
Edible beans and pulses	34.3	2	2	2	3	2
Edible nuts	18.2	2	2	2	2	2

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Food consumed during the 12 months prior to the census taking came from two sources: (a) own produce (from agriculture/fishing/forestry), and (b) purchase of foods from markets or other food outlets.

Figure 9.2 Percentage of households reporting consumption of basic food types in the past seven days by source of food.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Of the eight basic food types consumed by households, 83 percent of agricultural households reported consuming rice and other cereals from their own harvests. Sixteen percent reported purchasing rice and cereals from markets and other retailers. Whereas the majority of households produced enough rice and cereal for personal consumption, they also purchased other basic food items, which they did not produce or could not produce in such quantity as to satisfy personal needs. Households also sold

their rice and cereal crops in order to purchase other basic foodstuffs, as well as items of clothing and shelter.

A large percentage of agricultural households purchased meat and meat products, as well as fish and other seafood, in markets and other retail outlets. Households in the Tonle Sap Lake Zone and Coastal Zone had more opportunity to consume their own, self-produced fish and seafood than households in other zones.

Food Security

“Food security exists when all people, at all times, have physical and economic access to sufficient, safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life” (definition agreed to at the 1996 World Food Summit).

Around 16 percent of responding households (331 000) reported experiencing food insecurity and shortages during the 12 months prior to the undertaking of the census supplementary module. Eighty percent of that number experienced food insecurity for one month; 38 percent experienced insecurity for 2 to 3 months; and 24 percent experienced food insecurity for more than three months.

Figure 9.3 Percentage of agricultural households that experienced food shortage for various time periods for those households that reported experiencing food shortage.
Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

The Coastal Zone and the Plateau and Mountainous Zone had the largest number of households that reported suffering food insecurity for two to three months. The Plateau and Mountainous Zone also had the largest number of households experiencing food insecurity for more than three months (28 percent of all households experiencing food insecurity), followed close behind by households in the Plains Zone (25 percent of households experiencing insecurity). Ratanak Kiri and Kandal had the largest number of households (more than 40 percent) that experienced food insecurity for more than three months.

Reasons for Food Insecurity

Eighty percent of agricultural households that experienced food insecurity blamed low crop yield for

their food shortages. Almost 39 percent blamed food insecurity on damage to their crops due to heavy rain, drought, pests, and other natural calamities experienced in the 12 months prior to the census. Around 23 percent blamed the high cost of food in markets and other retail outlets. Other reasons for food insecurity provided by respondents included: illness experienced by the owner of the agricultural holding leading to limited production, and loss of work leading to limited budget to purchase food.

Figure 9.5 Percentage of households reporting various causes of food shortage.

Source: NIS-MoP, Census of Agriculture in Cambodia (Supplementary Module 2013)

Of the agricultural households that reported food shortage, 89 percent (295 000 households) employed some methods to resolve such problems, including the primary solution (reported by 50 percent of households) of borrowing money, securing food on credit or as advance payment for manual labour to be undertaken at the time of the next harvest. The second most common solution was to send a household member to look for work or other sources of income outside the agricultural holding.

Sale or barter of non-food crops, livestock/poultry and handicrafts, etc., was another means by which agricultural households responded to food insecurity. For poor households without such means, direct assistance was sought from relatives residing locally or living abroad, and acceptance of assistance from charitable institutions if available.

Annex 1: Scope, Methodology and Quality of Data

Introduction

The Census of Agriculture in Cambodia (CAC), conducted in 2013, was a comprehensive statistical undertaking for the collection and compilation of information on crop cultivation, livestock and poultry raising and aquaculture operations. The data collected and generated from this census are planned to be used in the formulation of plans, policies and programs for the development and improvement of the agriculture and fisheries sectors in the Royal Government of Cambodia (RGC). This was the first census of agriculture conducted in the Kingdom of Cambodia.

The National Institute of Statistics (NIS) of the Ministry of Planning and the Ministry of Agriculture, Forestry and Fisheries (MAFF) were the responsible government ministries authorized to undertake the CAC 2013. While the NIS had the census mandate, the MAFF is the primary user of the data to be produced from the census.

The CAC was conducted under the Statistical Law of Cambodia signed on 19 July 2010 that stated the confidentiality of the data regulated by Article 22. Any information that was collected from the individuals/households/holdings/establishments in the CAC had to be kept strictly confidential and should not be divulged to any person except to the authorized NIS and MAFF personnel, acting in the performance of their duties.

A number of Sub-decrees were issued for the purpose of conducting the Census of Agriculture and formation of various committees and groups for planning and smooth operation of activities of census. The Sub-decree was issued on the organization and functioning of the National Statistical System.

Since the Agriculture Census was carried out for the first time in the Kingdom of Cambodia in 2013, the concepts and definitions followed in the census and survey were largely as recommended by FAO and UNSD. Keeping in view the national requirements as well as international comparability, some small changes were felt essential for meaningful interpretation and also, for the convenience of the survey operation. The *Instruction Manual for Field Officials*, available in the website of NIS holds details of concepts and definitions of various terms used in the census and survey.

The aspects of data collection and quality depend on:

- (i) Survey Methodology
- (ii) Sample Design
- (iii) Survey Organisation

The quality of statistical product will largely depend on planning, designing and organization of the error factors, and data quality can finally be assessed through the examination of accuracy and reliability of data collected.

This note is to convey the information in respect of all these aspects in the conduct of the Census of Agriculture in Cambodia in 2013, together with a brief analysis of the accuracy and reliability of data collected.

Objectives

The main objective of the CAC 2013 was to provide data on the temporal agricultural situation in the country that will be utilized by the planners and policy-makers. Specifically, the census data will be useful in:

1. Providing sampling frame in the conduct of agricultural sample surveys;
2. Providing data at the smallest administrative unit in the country; and,
3. Providing data on the current structure of the agricultural holdings with cropping, livestock and poultry raising or aquaculture activities in the country.

Census Scope

The CAC 2013 utilized six questionnaires for the census and survey in the household sector. Two questionnaires (Forms A & B) were used in the core module phase and canvassed on census basis, aiming to cover every household outside the urban districts of Phnom Penh. The other four questionnaires (Forms C, D, E & F) were used in the supplementary module phase and detailed data were collected on a sample basis. One questionnaire (Form G) was administered to the village leaders to collect information on topographical features, calamities or disasters, availability of economic activities, etc. along with availability of village level infrastructure. Separate forms were used to collect data for the non-household agricultural holdings. The questionnaires are available on the website for the NIS.

The CAC 2013 utilized six main questionnaires for the census and survey of the household sector. Two questionnaires (Forms A & B) were used in the core module phase and were canvassed on a census basis, aiming to cover every household outside the urban districts of Phnom Penh. The other four questionnaires (Forms C, D, E & F) were used in the supplementary module phase to collect detailed data on a sample basis. One questionnaire (Form G) was administered to village leaders to collect information on topographical features, calamities or disasters, availability of economic activities, etc., along with availability of village level infrastructure. Separate forms were used to collect data for the non-household agricultural holdings. The questionnaires are available on the website for the NIS.

The scope of each questionnaire was as follows:

Form A – Listing Form: Collected information on the location and involvement of households in agriculture or aquaculture activities. This form was used to identify households qualifying for inclusion in the census by having a land holding used for agricultural purposes.

Form B – Basic Information on the Agricultural Holding: Collected information on the location, the respondent and the agricultural holding. Information included the legal status of the agricultural holding, basic characteristics of the holding such as size, number of parcels in the holding and location, actual area, main land use, land tenure of each parcel in the holding, presence of forest and other wooded lands, use of irrigation, temporary crops planted, permanent crops planted, main purpose of production, livestock and poultry raised in the holding, presence of aquaculture and the landholder's household information.

Form C – Growing of Crops: Collected information on the location, respondent and agriculture holders as well as sub-holders; temporary crops planted and harvested, including area planted, cropping duration, cropping pattern, and area harvested; permanent crops, including area of compact plantations and number of productive permanent crops in scattered planting, irrigation and other information regarding parcels and agricultural activities in the homelot; agricultural practices, implements,

equipment and machinery used in the holding; agricultural services, membership in an organization and other relevant information.

Form D – Raising Livestock and Poultry: Collected information on the location, respondent, the agricultural landholder and sub-holders; livestock and poultry raised as of the time of enumeration; inventory of livestock and poultry during the previous 12 months; equipment, machinery, buildings and access to agricultural extension services.

Form E – Aquaculture Activity: Collected information on the location, respondent and aquaculture operator and sub-operators; details of aquaculture activity, including types of culture, location, actual area, production facilities, types of water used, main species cultured and equipment and machinery used; household involvement, hired labor and other relevant information.

Form F – Relevant Information on the Agricultural Household: Collected information on the location, respondent and agricultural landholder; agricultural household population: total number, name, relation to head, sex, age, marital status, highest school grade completed, currently attending school, physical/psychological/mental difficulty; primary and secondary economic activity, status of employment and tasks done in own agricultural holding in previous 12 months; other farm labour, food security, other economic activities such as catching fish and aquatic products in marine or inland waters, forestry-related activities, etc.

Form G – Village Questionnaire: Collected information on soil types, main topographical features, susceptibility to calamity or disaster within the previous five years, economic activities available, seasonal labour movement, crop duration, presence of agro-processing equipment, machinery and facilities, mode of transport, availability of schools, communication facilities, health facilities, water facilities, access to roads and presence of markets, presence of people's organizations, presence of NGO/INGO, ethnicities and religion.

All households in the country were interviewed in the first phase using Form A to determine their involvement in agricultural holdings. In the case where a household was found to be involved in agricultural activities and qualified for inclusion, according to the definition of an agricultural holding, the household was further interviewed using Form B. Detailed data in respect of agricultural holdings were collected using appropriate Forms F and C and/or D and/or E during the supplementary module phase from a sample of households, which were selected using probability sampling methods.

Geographical Coverage

All households in the entire country excepting a few districts of Phnom Penh - known to be core urban areas, were covered in the CAC 2013, along with large agricultural establishments operated by corporations, cooperatives, government and private institutions – termed 'juridical holdings' – in the non-household sector.

Agricultural holdings owned, managed and operated by the urban households or entities not encountered in the census coverage area, were thus kept outside the purview of survey coverage. Secondly, the smaller agricultural establishments engaged in farming in the non-household sector could not be covered in the survey, as their number was felt to be insignificant and preparation of such a list at the country level for inclusion in the surveys was considered un-economical. Third, all villages having only a small number of agricultural farm households; say, 5 or less, were excluded from the sampling frame for the supplementary modules.

Survey Timing and Reference Period

The CAC 2013 was undertaken in two phases: a core module – meant for listing of all households in all villages in the country - was undertaken in 45 days from 17 April 2013 to 31 May 2013; and the supplementary module was taken up during November 1-22, 2013. There was a slight spill-over of survey period in the supplementary phase due to heavy rain and access problems for the survey teams, particularly in the hilly areas.

The twelve months prior to 1 April 2013 (i.e., from 1 April 2012 to 31 March 2013) were, in general, used as the reference period for Form A and Form B. For most of the items of Forms C, D, E and F, the reference period was the 12 months immediately preceding the surveys conducted in November 2013. However, the reference period for some of the items was different from the one specified above, as indicated separately for each data item in each questionnaire.

Sampling

In the core module, the listing and collection of some basic information about their involvement in agriculture and aquaculture activities was done in respect of all households of all villages in the country. In the supplementary module, the survey was carried out both in the household and non-household sectors, and the statistical units were agricultural households in the household sector and large agricultural establishments operated by corporations, cooperatives, government and private institutions in the non-household sector.

The list of villages compiled for the Population Census (PC) 2008 was used as the basic document for starting the listing work of CAC 2013 in the core module phase. Then, the list of agricultural farm households prepared from the data collected in Form-B in the core module phase was used as the sampling frame in the supplementary phase. The ‘large’ agricultural farm households were identified at this stage from the list so prepared. In addition, a list of ‘special’ agricultural holdings and ‘juridical’ agricultural holdings was prepared at the administrative level and was used to include the large holdings in the survey.

Survey Procedure

All data in CAC 2013 were collected in de-facto method by a group of trained enumerators and supervisors by directly interviewing the eligible members of the farm households.

The respondents were any adult member (18 years old and over) of the household who should be knowledgeable of the agricultural holding activities. The most qualified respondent was the agriculture holder. However, in his or her absence, the spouse or any son or daughter 18 years old and over could also act as respondent. No household member below 18 years or neighbours or other households was interviewed or asked for the information of the household surveyed.

The data in the census and survey were collected using standardised structured questionnaires guided by the *Instruction Manual for Field Staff* giving detailed concepts, definitions and procedures followed for collection of each item. The draft questionnaires and instructions manual were prepared on the basis of the recommendations of the User-Producers Workshop. The census questionnaires and enumeration manuals were revised and finalised based on the results of a pilot census and the experience gained during this exercise. The *Instruction Manual for Field Staff* was supplemented by a set of checks on the data consistency carried out in the field, at the data entry stage and in the subsequent data validation processes.

Advocacy Plan

Before the start of field work, a thorough advocacy plan was launched to inform all households and all non-households engaged in agricultural activities in the country to get their support and cooperation as well as the village leaders to provide information. This indirectly reduced the burden of the respondents in providing information.

An awareness campaign was done through the mass media using television and radio, and the use of banners and posters, stickers on bags, T-shirts and caps used for the census and surveys. This apart, leaflet and pamphlets were prepared explaining ‘What is the Census of Agriculture in Cambodia?’, ‘What agency is responsible for the conduct of CAC?’, ‘How essential is the CAC 2013?’ etc. These documents are available at the NIS web site.

Sample Design and Field Operations

In general, a stratified two stage sampling design was adopted for the survey. The first stage units (FSU) were the villages within the commune, and the households with small agricultural holding within the sample village were the second stage units (SSU). The FSUs were selected within each commune by systematic Probability Proportional to Size - size being the number of households with agricultural holdings - and the SSUs were selected systematically with a random start. The first stage of sample selection was done at the commune level using a sampling rate of 50% to be able to produce the statistics at this level. The households with small agricultural holdings were selected with a sampling rate of 5%, that is, for every 20 households with small agricultural holdings, one of these was chosen as sample household. The details of the sampling design are discussed below.

Sampling Design and Estimation Procedure

Statistical Unit

The data collection in CAC 2013 was undertaken in two phases: in the core module, the listing and collection of some basic information about their involvement in agriculture and/or aquaculture activities was done in respect of all households of all villages in the country. In the supplementary module, the survey was carried out both in the household and non-household sectors, and the statistical units were agricultural farm households in the household sector and juridical holdings in the non-household sector. The special agricultural holdings were listed with a view to prepare estimates at the country level.

For the purpose of data collection in the supplementary module of CAC, the agricultural holdings were categorized in to the following types as given below:

- a. Those operated by households using agricultural lands with a total of less than 10 hectares and/or with 2-9 large livestock and/or 3-29 small livestock and/or 25-499 poultry and/or combination of livestock and poultry and/or homelot activities with at least 50 permanent crops/trees (same or different kinds), were called ‘small’ agricultural holdings;
- b. Those operated by households using agricultural lands with 10 hectares and over and/or 10 or more large livestock and/or 30 or more small livestock and/or 500 or more poultry, were called ‘large’ agricultural holdings;
- c. Those operated by very important households (VIHs) using vast hectares of lands, were called ‘special’ agricultural holdings; and,

- d. Those operated by corporations, cooperatives, government institutions and private institutions, were called 'juridical' agricultural holdings.

All agricultural holdings in the last three categories identified for the census were completely interviewed in the second phase of the CAC 2013 operation. Sampling was applied in the first type of operational holdings. Note that the 'special' operational holdings were few in number. Similarly placed households residing in the urban areas of Phnom Penh, but having lands in the rural areas, if any, were not captured in the survey to maintain economy in the operation. Secondly, a list frame was available for the institutional holdings, that is, those operated by corporations, cooperatives, government institutions and private institutions, and they were about 100 in numbers. The distribution of these units into commune was restricted owing to maintaining confidentiality of information, and thus, the estimates in respect of them might be attempted at the national level.

Sampling Methodology for Small Agricultural Holdings

In general, a stratified two stage sampling design was adopted for the survey. The first stage units (FSU) were the villages within the commune, and the households with small agricultural holding within the sample village was the second stage units (SSU). The FSUs were systematically selected within each commune by Probability Proportional to Size (PPS) sampling - size being the number of households with agricultural holdings in the commune and the SSUs were selected systematically with a random start. The first stage of sample selection was done at the commune level using a sampling rate of 50% - to be able to produce the statistics at this level. The household with small agricultural holding was selected with a sampling rate of 5%, that is, for every 20 households with small agricultural holdings, one of these was chosen as sample household.

It would be convenient to understand the stratification if the procedure of selection of FSUs using the PPS adopted for the survey is described first. The following procedures were used:

- a. The number of households with agricultural holdings in each village in each commune was determined.
- b. The running cumulative number of households was calculated. The last number corresponded to the total households with agricultural holdings in each village.
- c. Then the number of sample villages was determined by getting the 50% of the total number of villages in each commune.
- d. The sampling interval was computed by dividing the number of households with agricultural holdings in each commune by the number of sample villages.

If the number of households in a particular village in a commune was greater than the sampling interval, this was outright included in the sample villages of the commune. Then the cumulative number of households, number of sample villages and sampling interval were re-computed.

- e. Afterwards, a random start was determined between 1 and the sampling interval.
- f. The sample villages were determined using the following series: RS; RS + SI; RS + 2SI; RS + 3SI; RS + 4SI; RS + 5SI; RS + 6SI; RS + 7SI; RS + 8SI; RS + 9SI.

If the sample village had 6-39 households with agricultural holdings, two sample households (due to budgetary constraints) were selected using systematic sampling.

All households with large agricultural holdings categorised as (b), (c) and (d) in Para-2.2 above, whether residing in sample villages or non-sample villages were completely enumerated in the supplementary module.

Stratification

The villages were first grouped as below, in accordance with the definitions given above:

1. First, all institutional holdings in the country, i.e., those operated by corporations, cooperatives, government institutions and private institutions - the 'juridical' agricultural holdings also were grouped (say, Gr-1);
2. Then, all households with 'special' operational holdings within the commune were grouped (say, Gr-3);
3. Then, all households with 'large' operational holdings within the commune were grouped (say, Gr-2);
4. Then, all villages reported with 5 or less number of households with 'small' operational holding were grouped (say, Gr-4);
5. Then the remaining villages, that is, all villages with 6 or more households with 'small' operational holdings were grouped (say, Gr-M).

The Group-M was again divided into two during the drawing of sample villages so that a separate group was formed with the over-sized or 'certainty' villages (FSUs).

Thus, the villages of Group-M were divided into two as:

- The 'certainty' villages within the commune, that is, those villages where the number of households in the villages in a commune was greater than the sampling interval in the first step, were outright formed a group (say, Gr-5). A sample of farm households was selected from all such villages.
- Then the remaining villages of Group-M formed the last group (say, Gr-6).

Group-1 & Group-2 were formed at national level, and Group-4 might also be considered at national level as Forms-C/D/E/F were not canvassed in them. Groups-3, 5 & 6 were available at the village and commune level.

Sampling Strategy Adopted

1. Group-1: A list frame of 'juridical' agricultural holdings was available at the country level and all the units were surveyed, and as reported, a national level estimate will be generated only. Thus, no sampling was done in this group or stratum.
2. Group-2: A list frame of 'special' agricultural holdings was prepared at the country level and all the units were surveyed, and as reported, national level estimate may be generated only. Thus, no sampling was done in this group or stratum.
3. Group-3: All such households identified during the listing of farm households in Form-B for each village and community were surveyed completely. Thus, no sampling was done in this group or stratum. The estimates can be generated at the village and community.
4. Group-4: Forms-C/D/E/F was not canvassed in the villages of this group. But Form-G was canvassed in all the villages in the country for collection of village statistics. Thus, no sampling was done in this group or stratum. But, the estimates can be generated at the village and community level based on Form-G.
5. Group-5: All the 'certainty' villages identified at the sampling stage were selected for collection of data in respect of Forms-C/D/E/F from the selected sample households, as

mentioned earlier. Thus, a single stage sampling of households was done in this group or stratum. The estimates can be generated at the village and community level using the sampling design.

6. Group-6: Data in respect of Forms-C/D/E/F were collected from the selected sample households of selected sample villages of this group. Thus, a two stage sampling of villages and then households was done in this group or stratum. The estimates could be generated at the village and community level using the design.

Once the estimates of any parameter are obtained at the commune level, the estimates can then be added over communes to get it at the province level, and similarly for the nation. The estimation procedure is explained below for a community.

Estimation Procedure

Notations:

s = subscript for sth commune.

i = subscript for ith FSU [village].

k = subscript for kth sample household within an FSU.

Z = total of size (no. of farm households) of all villages belonging to the group in a commune.

z = size of sample village (i.e., no. of farm households) used for selection.

N = number of villages (FSUs) belonging to the group in a commune.

n = number of sample FSUs actually surveyed excluding casualty (non-reporting) but including 'zero' cases.

H = number of farm households listed in an FSU (village).

h = number of farm households actually surveyed in an FSU excluding casualty (non-reporting) but including 'zero' cases.

x, y = observed value of characteristics x, y under estimation.

\hat{X} , \hat{Y} = estimate of population total X, Y for the characteristics x, y.

Important note for zero cases: A sample household is considered to be 'zero' case when all the forms (C/D/E/F) could not be canvassed due to wrong identification of such households at the listing stage (Form-B), and such cases are to be distinguished from that of the cases of 'non-response'. In calculating weights, the sample counts (n or h as the case may be) are not adjusted for 'zero' cases, but adjustment is done in the case of 'non-response'.

Under the above symbols,

y_{sik} = observed value of the characteristic y for the kth household in the ith FSU belonging to the sth commune.

Formulae for Estimation of Aggregates for a Commune:

The general expression of the estimate of population total Y for the characteristics y for the sth commune can ideally be written as:

$$\hat{Y}_s = \hat{Y}_{1s} + \hat{Y}_{2s} + \hat{Y}_{3s} + \hat{Y}_{4s} + \hat{Y}_{5s} + \hat{Y}_{6s}, \quad \dots \dots \dots \quad (1)$$

where the suffix 1, 2, 3, 4, 5 & 6 represents the estimate for the respective stratum or group.

But in practical situations explained above, the estimates at the commune level will come from the

Groups-3, 5 & 6 only. Again Group-3 being completely enumerated, calculation of design based weights does not arise. The estimates obtained for Group-3 will be added with the corresponding design based estimates obtained from Groups-5 & 6 at the desired level of domain. Estimation procedures for Groups-5 & 6 are explained below:

Forms-C/D/E/F: Household Forms (Schedules)

(i) For estimation of any characteristics for the Group-5 in the s^{th} commune:

$$\hat{Y}_{5s} = \frac{N_{5s}}{n_{5s}} \sum_{i=1}^{n_{5s}} \left[\frac{H_{5si}}{h_{5si}} \sum_{k=1}^{h_{5si}} y_{5sik} \right] \dots\dots\dots (2)$$

Here, $n_{5s} = N_{5s}$ and thus their ratio will be one for Group-5 since there was no first stage selection, that is, all villages were surveyed. This factor is kept in Eq. (2) to tackle the ‘non-response’ cases, if any, or to tackle the cases when merging will be done with it in the case of void stratum. In case there is no cases of ‘non-response’ or merging of strata does not rise, then the factor N_{5s}/n_{5s} in Eq. (2) above can be ignored.

(ii) For estimation of any characteristics for the Group-6 in the s^{th} commune:

$$\hat{Y}_{6s} = \frac{Z_{6s}}{n_{6s}} \sum_{i=1}^{n_{6s}} \frac{1}{z_{6si}} \left[\frac{H_{6si}}{h_{6si}} \sum_{k=1}^{h_{6si}} y_{6sik} \right] \dots\dots\dots (3)$$

First the estimate ($\hat{\mathbf{Y}}_s$) of a commune will be obtained using Equation-1. Then, estimate for a province will be obtained by adding commune level estimates ($\hat{\mathbf{Y}}_s$) over all the communes within the province and again, for the country by summing over all the provinces.

Estimate of Ratios:

Let \hat{Y} and \hat{X} be the overall estimates of the aggregates Y and X for two characteristics y and x respectively at the commune/ province level. Then the ratio estimate (\hat{R}) of the ratio ($R = \frac{Y}{X}$) will be obtained as $\hat{R} = \frac{\hat{Y}}{\hat{X}}$.

Calculation of Weights:

Forms-C/D/E/F	Group-6	$\frac{Z_{6s}}{n_{6s}} \times \frac{1}{z_{6si}} \times \frac{H_{6si}}{h_{6si}}$
---------------	---------	---

Group-5	$\frac{N_{5s}}{n_{5s}} \times \frac{H_{5si}}{h_{5si}}$
In case there is no 'non-response' or merging of strata does not occur, then the factor N_{5s}/n_{5s} for Group-5 may be ignored.	

Operational Aspects

The operational aspects of the census and associated surveys can broadly be divided into three phases:

- 1) Preparation and planning tasks;
- 2) Collection and processing of incoming survey data, e.g. checks on completeness, implementation of extensive plausibility checks, initiating reminder procedures;
- 3) Preparation and analysis of data in the form of tables and graphs, publication of results in numerous publications and preparation and transmission of data sets on individual holdings to public.

The National Institute of Statistics (NIS) of the Ministry of Planning and the Ministry of Agriculture, Forestry and Fisheries (MAFF) of RGC had the State responsibility for implementing the Agriculture Census and Farm Holding Survey. Since the census and farm holding survey were undertaken for the first time, its specialist team was supported by experts of relevant disciplines from national and international organisations and bodies. On the top, there was a National Committee for the Census of Agriculture (NCCA) of the Kingdom of Cambodia in 2013 headed by the Minister of Planning with other ministers as members of the Committee. This committee was technically supported by a Technical Committee on the 2013 Census of Agriculture (TCCA) headed by a Secretary of State. A Chief Technical Adviser of international repute was engaged to provide all technical inputs to TCCA. This apart, two more committees were formed: (i) a Statistics Advisory Council for determining official statistical policies; identifying statistical priorities and requirements to be addressed by the National Institute of Statistics and designated statistical units; and for determining the dates of conducting the population, agriculture, and establishment censuses, and (ii) a Committee on the 2013 Census of Agriculture of Banteay Meanchey Province mainly for, among other things, collaborating with the Technical Committee on the Census of Agriculture to prepare all documents, materials, equipment, and to prepare and carry out the staff training programmes. Working below this level, there were Provincial Census Committees (PCCs), headed by Provincial Director of Planning, formed in the Ministry of Planning for coordination of all activities among the districts, communes and villages and also, for making all logistics arrangements. In addition, there was a large number of enumerators and supervisors engaged for data collection and supervision.

The communes and village level in the provinces were associated with the census and surveys. The advantage of engaging local level governments, village leaders and local livestock workers for data collection was that they were personally acquainted with some of the respondents and were familiar with regional circumstances that helped in improving the data quality indirectly.

The entire data in the core module of CAC 2013 were collected from over 2.6 million households spread over 14 073 villages, 1 621 communes, 194 districts and 24 provinces by the trained enumerators who were selected from university students and graduates and Village Animal Health

Workers on the basis of qualifying tests. The data were later extracted for the 25 provinces following the creation of a new province.

The field operations included training of supervisors and enumerators, data collection and supervision. The central and field staff from NIS and MAFF and the 4,000 hired field data workers were trained before they undertook the data collection and supervision. Since the CAC was composed of two modules, separate training was conducted for each module. There were again two levels of training in both the core module and supplementary module, which were conducted separately. The two levels of training for each module were: (a) training of trainers, which included NIS and MAFF central office staff, provincial heads and representatives; and (b) training of enumerators and team supervisors. All field officials including the supervisors at all levels were trained extensively on concepts, definitions and procedures for data collection.

Whilst the data in the core module of CAC 2013 were collected from over 2.1 million households, the supplementary module – requiring relatively more skill and training for the enumerators– involved personnel drawn from university students and graduates and local educated youth in place of the local livestock workers. The village questionnaire (Form-G) was administered to the village leaders in all the villages during the census operation.

The accuracy of the final output of the CAC depends on the good quality of the data collection from the household being listed and enumerated. Even though the training was done properly and the data processing was efficiently developed, if insufficient quality controls were implemented during the data collection, the final data would still be of poor quality. There were several levels of supervisors in the CAC and channels of communication detailed in the *Supervisor's Manual*. The hierarchy along with a separate comprehensive guideline was prepared for the Provincial Census Supervisors (PCSs) and Team Supervisors (TSs) - highlighting different activities and quality control procedures - to properly monitor the progress of listing and enumeration of CAC and for early detection of any problems of data collection.

Data Processing

Once the entire data for a village were collected by the enumerators, they submitted the filled-in questionnaires to their respective team supervisors who in turn, carried out some scrutiny checks and sent them to the provincial head-quarters at the end of every week. The concerned officials in the head-quarters checked them again and finally sent the forms on to the national head-quarters for data entry and validation.

At the census head-quarters, the filled-in questionnaires were received first in the documentation control unit where certain minimum checks were conducted in respect of coverage and completeness of questionnaires before these were sent for data entry and further processing.

The processing of data and computation was done using the CSPro 5.0 data processing package. The validation of data started from the documentation stage, through data entry and subsequent processing in the sense that the data entry package was embedded with consistency checks. This was further followed by manual scrutiny, howler checks and finally, computer editing.

In the NIS Central Office, manual editing was done first at the documentation stage before the data entry of the census results. Once the entire data were finally validated, tabulated and made ready for dissemination, then the National Institute of Statistics (NIS) of the Ministry of Planning and the

Ministry of Agriculture, Forestry and Fisheries (MAFF) of RGC would be responsible for maintenance and dissemination of data obtained from the CAC 2013.

Accuracy and Reliability of CAC Data

There are two aspects of data validation: (i) internal validation that takes care of inter- and intra-module consistency of data collected in the survey and census, and (ii) the validation of collected data with external available sources. The first part of data validation is done in a routine manner, starting from documentation to the final table generation. The second part of data validation is also very important for acceptability of data in the public domain and requires comparison of the results with alternative sources of information.

External Data Validation

Before comparison of estimates obtained from two sources, it is important to compare the following aspects of each data set:

- Coverage,
- Concepts and definitions used,
- Method of data acquisition/ collection including instruments instructions (questionnaires, supervision/scrutiny of data, flow of filled-in questionnaire, processing of data, etc),
- Sampling errors,
- Non-sampling errors.

The sampling and non-sampling errors will be dealt with in the discussion of accuracy and reliability of data of this note and the first three aspects are discussed in brief below.

The CAC 2013 data was in two parts. The data collected in the core module (in Form A, Form B and Form G) were based on the complete enumeration subjected to its respective coverage. Data in Form A were collected from all households of the country, except a few districts of Phnom Penh – known to be core urban areas. Form G was carried out in all the villages irrespective of its size. Thus, this set of data could be subject to non-sampling errors only.

The very purpose of the data of Form B, prepared from Form A, identifying the qualified¹ households, was to prepare the list of households as the frame for selection of a sample of households for survey in the supplementary phase. Thus the smaller un-qualified households were left out of survey. The detailed data in respect of agricultural holdings were collected using Form F and the applicable Forms C, D and/or E during the supplementary module phase from the sample of households drawn from the list of Form B.

The villages with fewer than 5 agricultural holdings were not included in the survey for two reasons: their magnitude was considered to be small and to maintain economy of the survey. There are some other issues of coverage relating to supplementary module. While (i) the large agricultural establishments operated by corporations, cooperatives, government and private institutions and (ii) the

¹ 1 An economic unit under single management comprising of at least 2 large livestock and/or at least 3 small livestock and/or at least 25 poultry of any kind and/or land with a size of at least 300 square meters (or 0.03 or 3A) used wholly or partly for agricultural production purposes regardless of title, legal form or size.

agricultural holdings located in the rural areas, but owned, managed and operated by the VIPs residing only in the urban areas were listed at the country level for survey (termed as ‘special’ holdings), other similarly placed ‘special’ agricultural holdings and small agricultural establishments engaged in farming in the non-household sector were not covered in the survey. Lastly, in the survey, estimates for 4 communes could not be obtained, as no sample village could be surveyed (due to non-response) from them and thus, those remained out of survey coverage.

It is evident that the frame prepared based on Form B for survey is a truncated one in respect of coverage. While the data of Form B are expected to be suffering from non-sampling errors, the data of Form F and the applicable Forms C, D and/or E would be subjected to both sampling and non-sampling errors. It also is important to note here that all estimates derived from the data of Form F and Forms C, D and/or E would dimensionally correspond to the parameters of the domain generated by Form B, and not Form A nor for the country as a whole.

Concepts and Definitions

The concepts and definitions followed in the census and survey were largely followed as recommended by FAO and UNSD. Keeping in view the national practices and requirements as well as to maintain international comparability, some small changes were made for meaningful interpretation of results and also, for the convenience of the survey operation. The area of the agricultural holding, as defined in the survey, was the actual (net) measure of the size of the land in the agricultural holding. Area planted to a crop referred to the area planted on a particular parcel of land for each successive crop and thus represents the gross planted area. The area irrigated referred to the physical area of land irrigated, not the total area of crops irrigated. Thus, land irrigated for successive crops in different seasons within the reference year is only counted once in computing the area of land irrigated. On the other hand, area of crops irrigated referred to total area of crops irrigated counting the area as many times as a crop was cultivated and irrigated. This apart, in the survey, the data for poultry (chicken, ducks, etc) were counted and collected separately for young (age less than 10 days) and adults birds - keeping the provision to estimate the numbers jointly or separately.

Comparison of Estimates

Population and Households

Statement 1 gives the estimates of population and households based on ICPS 2013 and CAC 2013 along with the magnitude, differences and possible reasons for such differences, as well as the reliability of the estimates wherever relevant. Similarly, Statement 2 provides estimates of selected parameters such as number of households with agricultural holdings, area of household agricultural holdings, area planted to paddy and rubber, number of cattle, buffalo, chicken, etc. based on MAFF/DAHP estimate of 2013 and that of CAC 2013 with possible reasons for differences as well as the reliability of the estimates. These statements are found at the end of this Annex.

The ICPS 2013 estimate of population was 14 676 590 persons, of which about 21.44% were identified as urban dwellers. The number of households was estimated to be 3 335 589 - considering household size 4.4. In case the urban population of Phnom Penh (1 510 327) is excluded from the total population of Cambodia, then the estimate of population becomes 13,166,369 and the number of households 2,925,860 (considering household size 4.5).

The number of households obtained from Form A is 2.6 million and is 78% of the ICPS estimate of the number of households for Cambodia as a whole (3.3 million). The gap further reduces to 11% if the estimate of households based on Form A is compared with Cambodia excluding urban-Phnom Penh (2.9 million). The set of households generated in Form A may be considered to be the coverage in the core module phase, and the existing gap may be attributable to the exclusion of households from

coverage mentioned.

For the preparation of frame for supplementary survey, the list of households that qualified for becoming 'agricultural households' was prepared out of the households listed in Form A. Form B listed about 2.1 million agricultural households as a whole and it is around 82% of households listed in Form A. If compared with the estimated number of households of ICPS 2013, the list of Form B would cover about 65% of the households of Cambodia and 73% of the households of Cambodia excluding urban-Phnom Penh.

The percentage of these households relating to the villages with of 5 or less agricultural households not covered in Form B is estimated at around 1%. This apart, the estimate for four communes is estimated as less than 1% of the total. Thus the two categories taken together explain around 2% gap of coverage. Last and importantly, all households having less than 2 large livestock and/or less than 3 small livestock and/or less than 25 poultry of any kind and/or land less than 300 square meters (or 0.03 ha. or 3A) used wholly or partly for agricultural production purposes have been excluded from the coverage of survey. The number of such households is expected to be quite significant and would perhaps largely bridge the remaining gap with the list of Form A.

As seen in the foregoing discussions that the frame obtained from Form B, decidedly, does not cover the entire country – mainly for the specific objectives of CAC and partly, to control the budget to a rational size. Obviously, any estimate derived from the data of supplementary modules would adhere to the properties of the population from where the samples have been drawn and in this particular case, the domain of households of Form B. While comparing the estimates based on supplementary modules, it may be kept in mind that the domain size of Form B in terms of households is about 2.1 million agricultural households as a whole and it is around 82% of households listed in Form A and about 73% of the households of the planned coverage: Cambodia excluding urban-Phnom Penh.

In 2013, NIS conducted a mid-term Inter Census Population Survey. The estimates are available for comparison with the CAC data. Statement 1 gives the comparative estimates obtained from ICPS 2013 and CAC 2013 for Cambodia. The estimates of Form A and Form B are based on the complete enumeration for its desired domains, but the estimates of Form F are based on survey data - inflated to the scale of their calculated weights based on the sampling design adopted for selection. While the comparison of estimates of Form A and Form B with ICPS would give the magnitude of their respective coverage, the estimate of Form F would reveal, in true sense, the consistency with the parameters of population domain (Form B) as well as its reliability in statistical sense.

Estimates of two parameters - population and sex ratio - obtained from Form F have been compared here. The sex ratio obtained from the survey may indicate the possibility of under-count or over-count of gender specific household members. It may be seen that Form F data estimated 8.56 million population as compared to 8.8 million (97%) in Form B with coefficient of variation (CV) nearly zero. The estimate is very close to its population parameter and statistically very reliable too. Form F also estimated sex ratio of 997 females per 1000 males - lower than that of ICPS of 1048 females per 1000 males. Possibly, females might have been under-counted in the survey, as is often observed in other household surveys of other underdeveloped and developing countries.

The above observations also establish that in general there is no mistake in the evaluation of parameters of weight calculation for the survey and moreover, data in respect of population (household members) have been collected in the field quite satisfactorily. Thus the estimate of other parameters from the survey will largely depend on concepts and definitions used and data collected in the field based on them.

MAFF data compared to CAC

NIS data on Population Census is very straight forward. In 2013, they have conducted a mid-term Inter Census Population Survey (ICPS) and the data are available for use. The information on the number of cultivators and area under cultivation are available for agriculture years in the publication of MAFF. While counting the number of cultivators, the MAFF count a household as many times as a particular crop or different crops have been cultivated by a household during the agriculture year, i.e., during the rainy season and in the dry season together. There is a similar procedure for estimating the area cultivated. DAHP count the adult birds only while giving information on number of poultry in the publication for chickens and ducks together.

Both MAFF and DAHP have the similar processes of gathering data on cultivators, cultivated area, etc. and of livestock data. In both the processes, the village level workers are assigned the job of collection in the first stage. Some estimates on both cultivation and livestock are available from MAFF and DAHP for 2013 and those have been presented in Statement 2 along with those from CAC for Cambodia.

The MAFF administrative data generally follow the concept of gross area, that is, if a land has been cultivated twice by a crop or by different crops in an agricultural year, it is counted twice. Gross rice cultivated area of MAFF is found to be 3 052 420 ha compared to net estimated area planted to rice of 2 327 805 ha determined by the CAC. The said MAFF estimate is about 92% of the estimated net total area of household agricultural holdings (3 305 754 ha) of CAC. The corresponding percentage is 70% for gross area planted to rice of CAC. The estimates from both the sources appear to be dimensionally largely consistent and perceptible. The difference may possibly be attributed to the under-coverage of villages and households in the survey.

The DAHP considers only the adult birds in their count of poultry as against counting of both adult and young (age less than 10 days) birds but separately in CAC. CAC has estimated that about 57% of the total number of chickens was adults and for ducks, the percentage was 82% of the total in 2013. The DAHP do not give number of poultry separately for chicken and ducks, but the total estimate is 27.32 million. In the case of CAC, if the estimate is adjusted for young birds, the total number of adult chickens and ducks together exceeded the total number of chickens and ducks of DAHP by about 22%. The estimates of other parameters like (i) number of cattle per household (1.2), (ii) number of buffalo per household (0.2), and (iii) number of pigs per household (0.85) or some such variables of CAC appear to be perceptible and establish internal consistency. The estimates are very reliable in statistical sense too (see CV in the Statement 2).

In light of above findings, the estimate of poultry produced by the CAC may be viewed. Considering the consistency and reliability of the estimates of other parameters of CAC placed in this note, it is difficult to accept that the count of adult poultry has been over counted in CAC. The difference in the case of poultry birds between two sources may be scrutinised and reviewed at both ends.

Sources of Error

The accuracy and reliability of data collected from survey can broadly be measured by examining the three aspects of the data and these are:

- a) *Sampling errors*: measured generally in terms of standard errors, coefficient of variation, confidence interval of the estimates obtained from the survey;
- b) *Non-sampling errors*: assessed through the examination of:

- (i) Quality of data sources used ,
 - (ii) Coverage errors: under-coverage and over-coverage,
 - (iii) Measurement errors,
- c) *Non-response*: This may occur due to non-response of unit and non-response of item.

Sampling Errors

As explained in the sampling design adopted for the survey, four basic strata (Groups-1, 2, 3 & 4) were completely enumerated in the survey and importantly, they consist of all large farms. There will not be any sampling error in the estimates of parameters derived from them. Sampling has been adopted for other two strata (Groups-5 & 6), and therefore the estimates of parameters derived from them will be subjected to sampling errors.

It is important to note that a large amount of information has been collected in the supplementary module of CAC 2013, of which some are rare and some are concentrated in a few pockets of the country. In a multi-subject enquiry, it is very difficult to adopt a sampling strategy to bring efficiency of all the variables collected in the survey. In practice, some important variables are, in general, considered, for deciding the sampling strategy and sample size, and that too, in most cases, to get the robust estimates at the national or provincial level.

The estimates of important variables, their standard errors (SE), coefficients of variation (CV) and confidence intervals (CI) obtained from the survey have been obtained for some variables and these are given in Statement 3 at the national level (see at the end). It is seen that CV of all the estimates are very low and thus, quite reliable.

Non-sampling Errors

In dealing with primary data, several steps were taken in CAC starting from the planning stage through to the preparation of final results, to improve the data quality to reduce the sampling and non-sampling errors. The frequency of editing data on various items of information due to inconsistent entries, item-non-response or imputation may provide some inputs in assessing the accuracy of data in controlling the non-sampling errors in the field and these are given for some important characteristics in Statement 4 (see at the end).

In most cases, the frequency of data editing is found to be very small and insignificant. Only in a very few cases such as ‘number of parcels reported with actual area’, ‘number of households reported to have other livestock’, ‘number of households reported to have pond culture’, ‘number of households reported to have cage culture’, etc., the magnitude of data editing is found to be significant.

PC 2008 data were used as a secondary data source for two basic purposes: (i) preparation of list frame of villages for collection of data in the core module stage of CAC 2013 and (ii) planning and preparing budget for CAC 2013. While using the data for study of coding structure followed in PC 2008, some inconsistencies were noted and these were rectified in consultation with NIS. Secondly, it was reported from the field that some villages, although they existed during CAC 2013, did not appear in the list of PC 2008. This was reported from the hilly areas of a few provinces and may represent new settlements. However, the number of such cases was small.

Under Coverage

Under coverage occurs mainly in the field when a part of the selected areal units are not covered. For example, some of the households in the selected villages are omitted in listing and preparing frame of households for selection. This may happen also at the time of data processing when ‘total number of

households' listed in a village is wrongly entered a lower value than the actual one, and as a result, the weight calculated from it would be lower than the actual. This apart, under coverage may occur even when a stratum is found to be void, that is, no data could be collected in respect of all the samples allotted for that stratum. The number of void commune is found to be only 4 in CAC 2013. The name of province and number of void communes is given in Statement 5.

Statement 5: Number of void communes by province: CAC 2013

Name of Province	Total no. of commune	Total no. of void communes (name)
Battambang	115	2 (Prey Chas, Kaoh Chiveang)
Mondul Kiri	21	2 (Chhbar Ampov Ti Muoy, Kakab)
Cambodia	1590	4

Over Coverage and Multiple Listing

Over coverage may occur at the various stages of survey both in the data collection and processing operation starting from documentation to the final data validation. It can happen in the field when the geographical area of the areal unit (the village) has been wrongly identified by including the area of the adjacent areal unit(s) and thus listing and counting more households than the actual. The duplicate records can incidentally be created in the data processing stage and those can be deleted by comparing the raw data prepared at the initial stage with that prepared at the various stages of validation. Since such an analysis was not planned at the beginning, the frequency of such cases could not be analysed except at the final stage of computer editing. The number of duplicate household records deleted at the final stage of computer editing is given in Statement 6. This magnitude is found to be very small compared to the total data volume of CAC.

Statement 6: Number of duplicate household records deleted

Ref. to Form	No. of duplicate hh. records found	No. of duplicate hh. records deleted
Form C	115	115
Form D	49	49
Form E	0	0
Form F	184	184
Cambodia	348	348

Measurement Errors

The measurement error generally happens in the field in recording the quantitative entries, say, recording area of parcel, area irrigated, number of livestock, etc. by the enumerators.

Statement 7: Frequency of records with very low values or high values found and edited: CAC 2013

No.	Data reference (Sch./item)	Lower limit of data	Upper limit of data	No. of records read	No. of records corrected
1.	Form-D, Item-3.1a, Code 01	Cattle < 2 and no other livestock or poultry	-	0	0
2.	Form-D, Item-3.1a, Code 02	Buffalo < 2 and no other livestock or poultry	-	0	0
3.	Form-D, Item-3.1a, Code 03	Horse < 2 and no other livestock or poultry	-	0	0
4.	Form-D, Item-3.1a, Code 04	Other Large Livestock < 2 and no other livestock or poultry	-	0	0
5.	Form-D, Item-3.6	Small livestock < 3 and no other livestock or poultry	-	0	0
6.	Form-D, Item-3.12b	Poultry < 25 and no other livestock	-	0	0
7.	Form-B, Item-4.2a	-	Total area of hh. agri. holdings > = 100 ha	214	214

These errors may even happen in entering the data wrongly at the time of data entry. Such mistakes were largely taken care in the field by scrutinising the filled in questionnaires by the Team Supervisors and in the subsequent stages of manual scrutiny, and finally at the time of howler checking, that is, checking very high values or very low values. The frequency of such cases observed at the time of howler checking is given in Statement 7.

Non-response Errors

There are two types of non-response. One is that the sampled village or the household could not be surveyed at all (unit level non-response), and the other is that the household could not provide all information that was sought from and as a result, some of the data items remain un-reported for such households (item level non-response). These are also treated as non-response and the cases of non-response of sampled village or household are, in most cases, dealt with by adjusting the number of villages or households actually surveyed and thus the weights. It may be noted that there were 42 sample villages as a whole for which data could not be collected in CAC 2013.

One way of dealing with the problem of unit non-response is to make all efforts to collect information from a sub-sample of the units not responding at the first attempt. But in practice, it is hardly possible to carry out a small survey of non-response units besides the large scale survey operation. The main difficulty is to prepare a frame of non-responding units out of the large sample survey when it is over. Instead, most countries in their surveys adjust the weights by undifferentiated response rates for non-

response units and this method has been adopted in calculating weights in CAC.

The second kind of non-response error when information on some items in the questionnaire, for various reasons, could not be collected in the survey or is collected wrongly. Those are generally imputed using various strategies applicable for the case. The data validation manual that includes the imputation methods for Forms- C/D/E/F data was clearly documented in the *Instruction Manual for Field Officials* (see NIS website). The same information has also been used for machine editing (see frequency in Statement 4). This procedure also takes care of the cases of imputation of missing data items.

Overall Assessment of Data of CAC

It can be concluded from foregoing analysis and evidence that the overall quality of data of CAC is consistent to its coverage, consistent and perceptible with external data sets, internally consistent and highly reliable at the national level in statistical sense.

The convergence of estimates based on supplementary data of CAC with respect to its survey coverage also establishes the efficiency in controlling the non-sampling error at various stages and particularly, data collection mechanisms in the field.

The differences in the estimates of CAC with the external sources, wherever observed, may be scrutinised and reviewed at both ends. The limitations identified are to be eliminated for future data collection.

Statement 1: Some comparative estimates of population and households from CAC 2013 and ICPS 2013				
<i>Item of information</i>	<i>Estimate</i>	<i>Remarks</i>	<i>SE</i>	<i>CV(%)</i>
1. NIS - ICPS 2013: Cambodia				
1.1 Population	14.7 million	Urban population is 21.44%.		
1.2 Sex ratio (no. of females per 1000 males)	1048			
1.3 No. of households: Cambodia	3.3 million	Assuming average hh size = 4.4.		
1.4 No. of households: Cambodia excl. urban Phnom Penh	2.9 million	(i) Assuming average hh size = 4.5, as urban Phnom Penh has been excluded. (ii) Estimate is 88% of hh reported in Serial 1.3.		
1.5 No. of households: Cambodia excl. entire urban area	2.5 million	(i) Assuming average hh size = 4.6, as entire urban area has been excluded. (ii) Estimate is nearly 75% of hh reported in Serial 1.3.		
2. CAC 2013 : Cambodia				
Form A				
2.1 No. of households excluding : (i) hh of urban Phnom Penh, (ii) 'Special' hh agri. holdings, and (iv) Institutional holdings.	2.6 million	(i) Estimate is 78% of hh reported in Serial 1.3. (ii) Estimate is 89% of hh reported in Serial 1.4.		
Form B				
2.2 No. of agri. hh listed, excluding those in Serial 2.1 and: (i) All hh with land size < 0.03 ha and/or having a fewer no. of livestock or poultry were excluded. (ii) hh of villages with <=5 farm hh (1%), (iii) Four void communes (<1%).	2.13 million	(i) Estimate is 82% of hh reported in Serial 2.1. (ii) Estimate is 65% of hh reported in Serial 1.3. (iii) Estimate is 73% of hh reported in Serial 1.4. (iv) Estimate is 85% of hh reported in Serial 1.5. (v) List of Form B is used as frame, (vi) Form B covers about 65% of the hh of Cambodia. (vii) Important: Any estimate based on Forms C/D/E/F is to be compared w.r.t. this frame of Form B and its size.		
2.3 No. of persons listed	8.8 million	(i) Estimate is 60% of ICPS 2013 pop. in Serial 1.1. (ii) Estimate is consistent with coverage of Form B (domain size: 65%).		
Form F				
2.4 Estimated population	8.56 million	(i) Estimate is 58% of ICPS 2013 pop. in Serial 1.1. (ii) Estimate is 97% of pop. in Serial 2.3. (iii) Estimate is very much consistent with coverage of Form B. (iv) Estimate is very reliable in terms of CV.	0.5	0
2.5 Sex ratio	997	(i) Estimate is very close to ICPS estimate. (ii) Perhaps females are under-listed in survey (This is the phenomena in most countries).		

Statement 2: Some comparative estimates of agricultural households, area planted and livestock from CAC 2013 and MAFF 2013				
<i>Item of information</i>	<i>Estimate</i>	<i>Remarks</i>	<i>SE</i>	<i>CV(%)</i>
1. MAFF/DAHP 2013: Cambodia				
1.1 Rice cultivated area (ha): <i>gross</i>	3,052,420	1. Estimate is 92% of area reported in Serial 2.2 that includes area of homelots of holdings with separate agricultural lands.		
1.2 Rubber planted area (ha): <i>gross</i>	328,771	(i) Does it include scattered area under plantation? This needs verification.		
1.3 Chicken & Duck (excl. young birds)	27,316,415	(i) Adjusted (for young birds) CAC estimates is 22% higher than DAHP, (ii) It is important to examine the data collection methodology.		
2.CAC 2013: Cambodia				
Form C				
2.1 No. of household agricultural holdings (with/without separate agricultural lands)	2,129,149			
2.2 Total area of household agricultural holdings: <i>net</i>	3,305,754			
2.3 Area (gross) planted to rice (ha):	2,327,805	(i) Estimate is 70% of area reported in Serial 1.2.		
2.4 Area (gross) planted to cereals/grain crops (ha)	2.45 million	(i) Estimate is 74% of the reported area in Serial 1.2.		
2.5 Rubber (gross) planted area - compact (ha)	82,831.26			
2.6 Rubber planted area (gross) - scattered (ha)	1,884,231	One needs to convert the scattered plantation to compact area crop-wise.		
Form D				
2.7 Estimated no. of cattle	3.2 million	(i) Cattle per hh is 1.2, (ii) Estimate is very robust in term of CV.	11.2	0.0003
2.8 Estimated no. of buffalo	519 thousand	(i) Buffalo per hh is 0.2, (ii) Estimate is very robust.	7.9	0.0015
2.9 Estimated no. of pigs	2.2 million	(i) Pigs per hh is 0.85, (ii) Estimate is very robust.	2,172.80	0.0978
2.10 Estimated no. of chickens (incl. young birds)	45 million: (25.7 million ad	(i) 57% are adult birds, (ii) 14 chickens (adult) per hh (iii) Estimate is statistically very robust.	2,539	0.0056
2.11 Estimated no. of ducks (incl. young birds)	11 million (9.3 million ad	(i) 82% are adult birds, (ii) 5 ducks (adult) per hh. (iii) Estimate is statistically very robust.	10,324	0.0914

Statement 3: Estimates of some important indicators based on the data of supplementary module and its SE, CV and CI: CAC 2013

Indicators	Estimate	SE	CV (in %)	CI (at 95% level)	
				Lower limit	Upper
1. Area planted (gross) to non- rice	229,418.20	6.40	0.0003	2,029,405.66	2,029,430.74
2. Area planted (gross) to aromatic rice	280,359.11	36.07	0.0021	280,347.33	280,370.89
3. Area Planted (gross) to maize (white/yellow/violet)	125,179.69	5.98	0.0048	125,167.97	125,191.41
4. Area (gross) harvested for non-aromatic rice	1,834,084.15	4.70	0.0003	1,834,074.94	1,834,093.36
5. Area (gross) harvested for aromatic rice	254,618.70	6.00	0.0024	254,606.94	254,630.46
6. Area (net) irrigated for non-aromatic rice	587,802.00	4.90	0.0008	587,792.40	587,811.60
7. Area (net) irrigated for aromatic rice	55,977.00	2.20	0.0039	55,972.69	55,981.31
8. Number of cattle	3,248,417	11.20	0.0003	3,248,395	3,248,439
9. Number of buffalo	519,083	7.90	0.0015	519,068	519,098
10. Number of chickens (incl young birds)	45,167,583	2,539	0.0056	45,162,607	45,172,559
11. Number of ducks (incl young birds)	11,297,360	10,324	0.0914	11,277,125	11,317,595
12. Number of pigs	2,220,811	2,172.80	0.0978	2,216,552	2,225,070
13. Total population of households with agricultural holdings	8,563,932	0.5	0.0000	8,563,931	8,563,933

Statement 4: Frequency (in %) of data-items edited due to inconsistent entries, item-non-response or imputation: CAC 2013

No.	Description of item	Item reference (Questionnaire, Item, code)	Total no. of records read	Type of inconsistency (inconsistent, non- response or imputed)	% of cases deleted or corrected
Form B					
1.	Total no. of household (hh) records	Form-B	2,188,608	Deleted: inconsistent w.r.t. definition of agr. holding	1.28*
2.	(i) No. of hh reported to have cattle	Form-B, Item-11, Code 01	1,747,267	Deleted and/or imputed	1.04
3.	(ii) No. of hh non-response w.r.t. cattle	Form-B, Item-11, Code 01	441,341	based on other entry	2.23
4.	(i) No. of hh. reported to have buffalo	Form-B, Item-11, Code 02	1,747,267	Deleted and/or imputed	1.04
5.	(ii) No. of hh non-response w.r.t. buffalo	Form-B, Item-11, Code 02	441,341	Imputed based on other entry	2.23
6.	(i) No. of hh. reported to have chicken	Form-B, Item-11, Code 08	1,747,266	Deleted and/or imputed	1.04
7.	(ii) No. of hh. non-response w.r.t. chickens	Form-B, Item-11, Code 08	441,342	Imputed based on other entry	2.23
8.	(i) No. of parcels reported	Form-B, Item-4.3b, Code 1	3,795,229	Deleted and/or imputed	0.78

53.	No. of hh recorded	Form-F, Item-3.01	102,588	Deleted: inconsistent with other entry	3.43*
54.	No. of males	Form-F, Item-3.04	234,724	Deleted and /or imputed	3.45
55.	No. of females	Form-F, Item-3.04	225,177	Deleted and /or imputed	3.43
	No. of persons recorded with inadmissible sex code	Form-F, Item-3.04	165	Deleted and /or imputed	100
56.	Total no. of hired workers recorded**	Form-F, Item-4.3	383,866	Deleted and /or imputed	2.99
57.	No. of hh. recorded with '0' hired workers	Form-F, Item-4.3	117	Deleted and /or imputed	3.42
58.	No. of records with invalid values	Form-F, Item-4.3	154,586	Deleted and /or imputed	2.99

* The frequency of 'deletion/imputation' of any item/sub-item considered under a questionnaire (Form) is confounded with the percentage of household records deleted for that form. Thus the frequency of 'deletion/imputation' of any item/sub-item is expected to be much lower than it is reported here.

**This is, in fact, number of hired jobs (including full-time, part-time and occasional) created on the farms during the last 12 months preceding the date of survey.

Annex 2: Summary Statistical Tables

Summary Statistical Tables for Chapter 2 - Geography and Infrastructure
