

HEAVY METALS IN AGRICULTURE:

CADMIUM IN COCOA BEANS
CASES IN ECUADOR AND TRINIDAD & TOBAGO

DSc Sasha Tom Hart sashartom@gmail.com

June, 2023

Project Objectives

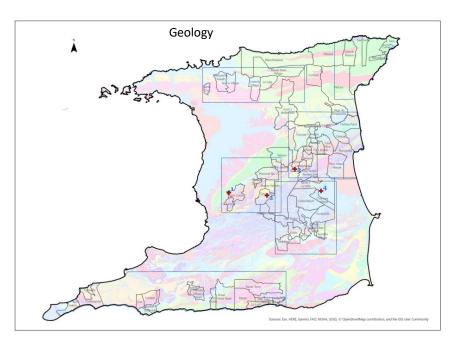

Main objective:

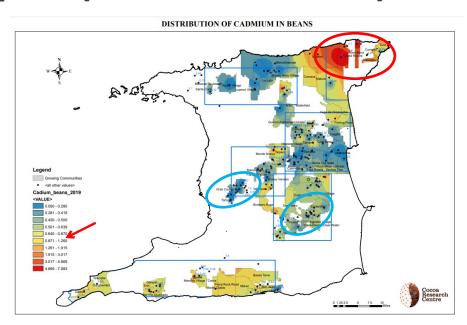

<u>Contribute</u> to implement actions of agenda GSOP18 ("Be the solution to soil pollution."). Focus Cd/cacao triggered by EU Reg. 488/2014, max. levels >2019 (<0.8mg/kg).

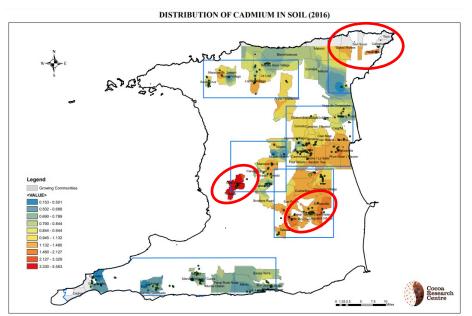

Specific objectives (initial steps):

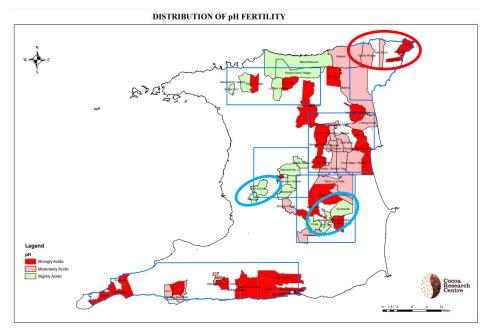

- Identify previous / ongoing research regarding Cd in cacao (watershed to soil scale);
- 2. Interviews at farms and <u>learn from local context</u>: Eastern Lowland/Trinidad & Tobago, Manabí/Ecuador (suspended);
- 3. Develop initial watershed scale conceptual models, based on a risk assessment approach;
- 4. Conclusions/ recommendations for solutions/ next steps.

Identified Research: Examples (to be Continued)

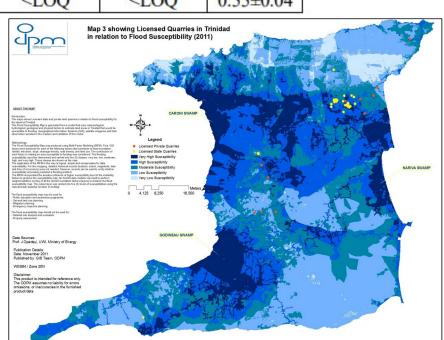

Ramtahal (2012): "The Triple Super **Phosphate** (TSP) (...) contained the highest Cd concentrations of $35\mu g/g$ (...)" Limited regulation on fertilizers (and manure)

Table 43: Mean Cadmium Concentrations of Sediments and Soil Samples 5m and 10m Inland from Manacal River Bank at Locations 1-5

Cd (µg/g± SD)	Location				
- 1 X 1 m 1	1	2	3	4	5
River Sediment	<loq< td=""><td><loq< td=""><td><loq< td=""><td>0.65±0.01</td><td>0.82±0.03</td></loq<></td></loq<></td></loq<>	<loq< td=""><td><loq< td=""><td>0.65±0.01</td><td>0.82±0.03</td></loq<></td></loq<>	<loq< td=""><td>0.65±0.01</td><td>0.82±0.03</td></loq<>	0.65±0.01	0.82±0.03

<LOQ: Below Detection Limit (< 0.5 μg/g)

"(...) suggests that <u>similar studies</u>
<u>be done</u> in other flood-prone
areas used for cacao cultivation."

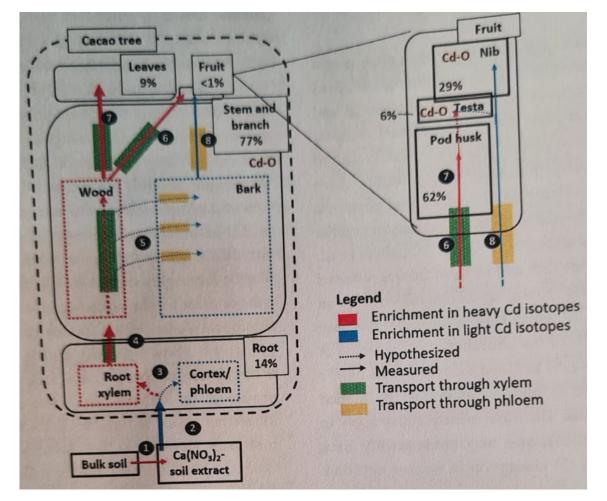

>floods

HIMAWATEE BABOOLAL (2019):

- "Cd (...) occurred at the rural site at levels much higher than expected."
- "Like As, Cd also is reported to be **enriched in the fine PM** (...) indicating that **Cd may not be from natural erosion**."
- "(...)periods that overlap with peak Sahara dust influx over the Caribbean."

GARRISON et al., (2010):

- "The African dust system is the largest in the world, annually exporting billions of tons of eroded mineral soils to the Caribbean and Americas (...)."
- "Dust from Africa is a **known source of nutrients and co-factors** to downwind organisms and ecosystems (...)."
- "The <u>enrichment of Cd</u> and Zn in dry deposition samples from (...) Mali was similar to (...) dust aerosol samples collected in **Barbados** (Trapp et al. 2008)"

"(...)isotope fractionation patterns alluded to a <u>more direct transfer from</u> <u>branches to nibs</u> that from leaves to nibs. The largest fraction (57%) of total plant Cd was present in the branches (...)." Blommaert et al. (2022)

Important researches on complex settings; basis for actions
Need for further data (confirm, spatial distribution, over time)

Interviews and Local Context

Institutions

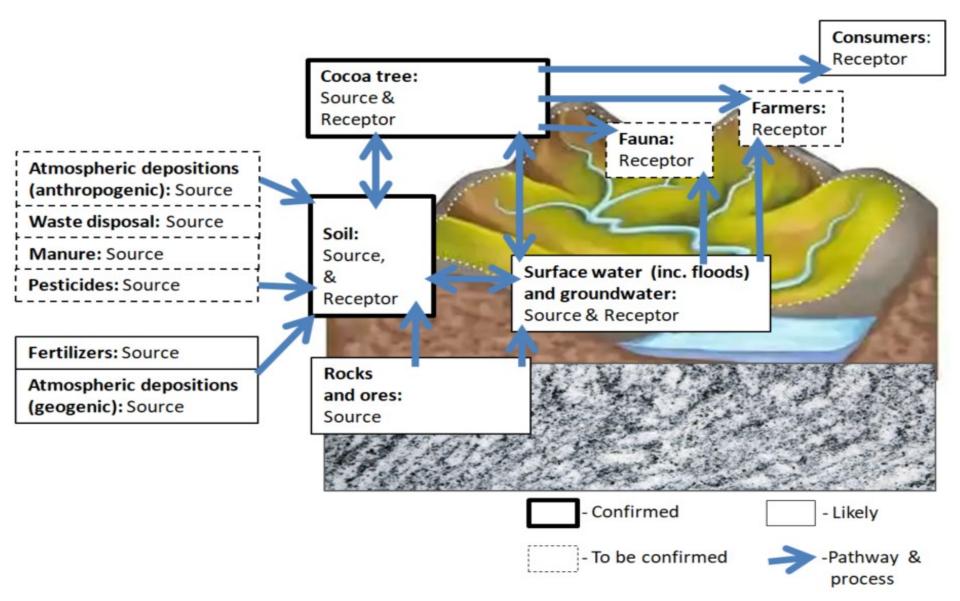

Farms

Sources and Processes

<u>Conceptual Model Cd/cocoa, Eastern Lowlands/T&T</u> (watershed level, risk elements)

Conclusions

The 2 study regions can be classified as <u>Complex Areas</u> (ITRC, 2017) with technical and non tec. challenges = long term solutions and adaptive management (intermediate objectives, periodic monitoring, conceptual model updates).

The applied <u>watershed scale initial steps</u> were considered useful by several stakeholders to support a <u>more clear and holistic understanding of the pollution</u>, in addition to develop **recommendations** and propose **next steps**.

Recommendations

Possible intervention solutions, from watershed to soil scale:

- 1. Evaluate and manage surface and groundwater quality.
- 2. Geogenic and anthropogenic air emissions of Cd.
- 3. Evaluate impact of **flooding and manage occupation**.
- 4. Import and application of **fertilisers**.
- 5. Import and application of **manure**.
- 6. Decrease bioavailability of Cd in the soil by applying amendments.
- 7. Application of nature-based solutions.
- 8. Management of cacao leaves and wood.
- 9. Alternative crops to replace cacao at specific locations.
- 10. Combine best management practices for Cd with related programs.

Next steps

In order to further assess/prevent/minimize soil pollution, the continuation of the project shall include the following steps:

- 1. <u>Test</u> the proposed <u>solutions</u> <u>new standardized field data</u> <u>combined</u> with <u>programs</u> Climate Change, Carbon Seq., Biodiversity, Lab. Meth.
- 2. Update the watershed conceptual models based on risk approach.
- 3. Apply the project to <u>other pilot test areas</u> in Latin America and, possibly, other geographies. <u>Care with differences</u>. Evaluate expanding to other crops and metals (data + adaptation).
- **4. Stimulate <u>knowledge exchange</u>** opportunities between relevant institutions. Results/outcome shall **reach <u>decision makers</u>**.
- 5. Develop <u>Action Plans, Road Maps</u>, and guidelines foster action about Cd-Cocoa situation (current and future).
