Marcos Angelini
Yusuf Yigini**

Technical Workshops. 2022

Soil Organic Carbon is the largest terrestrial carbon pool

promoting sustainable soil management for all

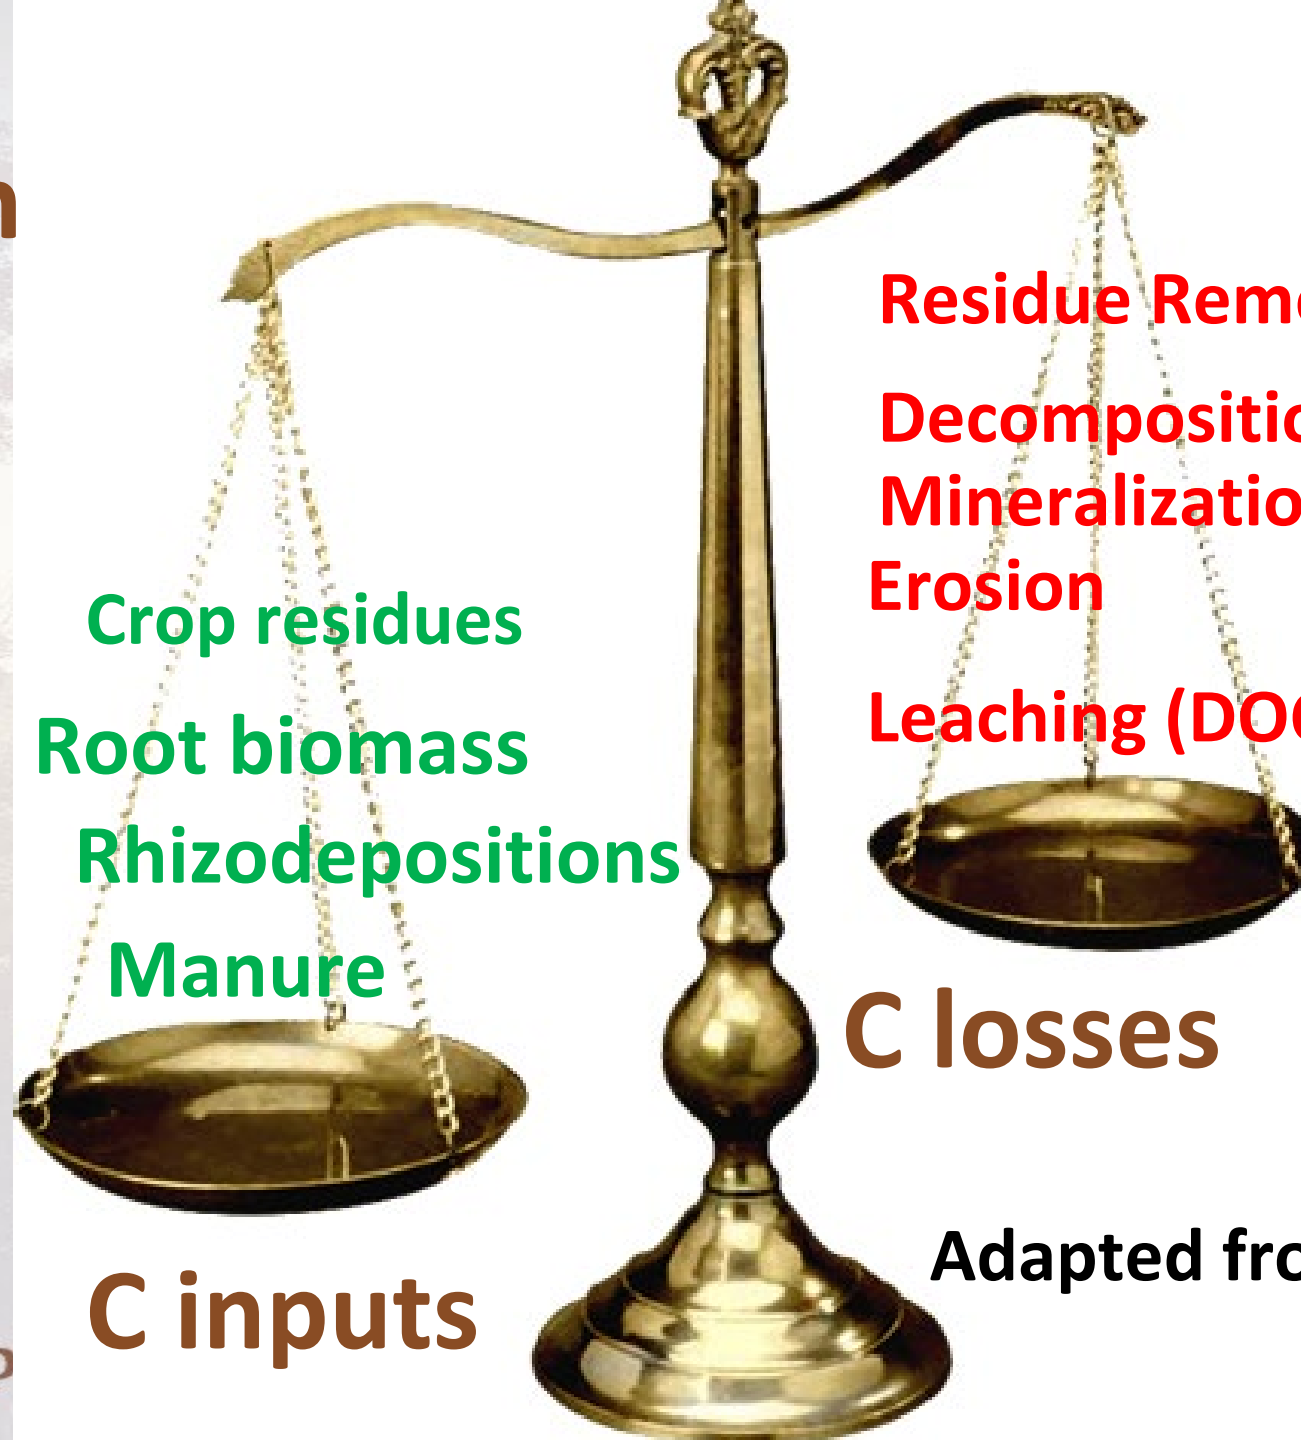

- **Due to the magnitude of SOC pool, small increases in SOC stocks can transform soils into potential carbon sinks (Paustian et al., 2016)**

- **CO₂ sequestration as SOC through sustainable management practices has been outlined as one of the most cost-effective practices to mitigate GHG emissions (Smith et al, 2008; Lal et al., 2018; IPCC, 2019; Smith et al., 2020).**

- **Besides other benefits linked to SOC increase: soil structure, water infiltration and retention, nutrient cycling, etc**

SOC sequestration

With the financial support of

Why GSOC_{seq} map?

Objective

- Identify which regions and productive systems show higher potential to increase SOC stocks, following harmonized and standardized procedures among countries

establish priorities for research and public and private policies

Support countries to develop Climate change adaptation and mitigation strategies, and sustainable development

promoting sustainable soil management for all

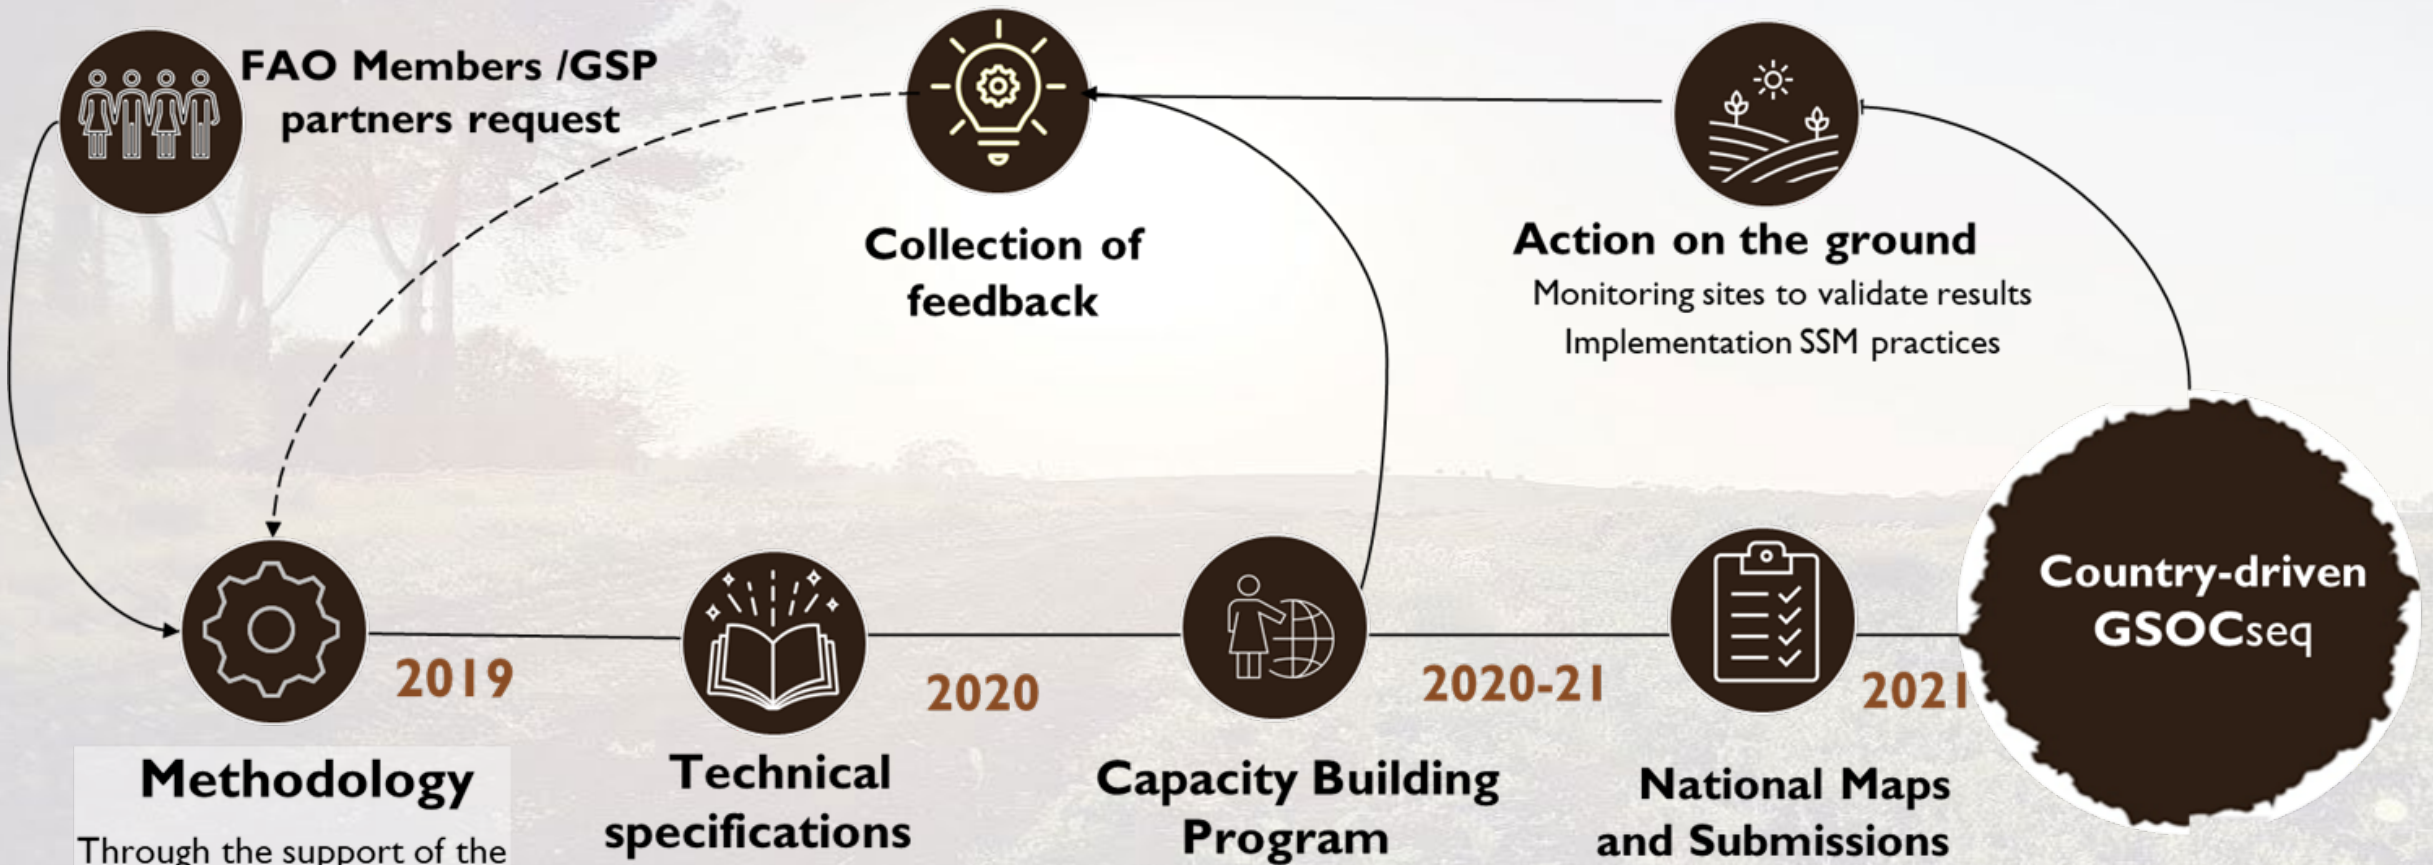

¿Why GSOC_{seq} map?

Country-Driven GSOC_{seq} product. Strengths:

- Local expertise, based on best available local data (“bottom-up”)
- Inclusive process, involving specialists from different fields and institutions
- Continuous improvement process ; “living product”

How is the GSOCseq Country-driven process?

Methodology
Through the support of the GSP's technical networks

Taking into considerations potential data and computational limitations

Technical specifications and country guidelines

Reviewed INSII, ITPS, CIRCASA, 4p1000, UNCCD

Capacity Building Program

Online Technical Manual
Online regional trainings

National Maps and Submissions

Permanently updated Submissions

promoting sustainable soil management for all

Country Driven GSOCseq. Workshops

- **Trainings/exchange workshops**
- **Harmonization of procedures and methodologies among countries**
- **Integration of experts among countries and within each country**

promoting sustainable soil management for all

Agenda

DAY 1 (3h) - Opening and Introduction

1. High-Level opening (Dr. Park Joungyoon, AFACI Senior Deputy Secretary General, AFACI Secretariat)- 10'
2. Introduction: The GSOCseq Initiative (importance, the process, benefits, timeline), General framework (BAU, SSM1-SSM2-SSM3, Meta-Analysis), Product specifications, discussion and feedback on national capacities

DAY 2 (3h) - Introduction to sequestration modelling

1. Introduction to sequestration modelling (RothC Basics), Input data requirements; uncertainties, software and tools (R, QGIS and Google Earth Engine to be used during the training)
2. Introduction to the R language and RStudio
3. Input data preparation: running Scripts 0 to 9

DAY 3 (3h) – Input data preparation

1. Input data preparation (continuation of Day 2): running Scripts 0 to 9
2. Harmonization of spatial layers

DAY 4 (3h) – Modeling and Mapping SOC sequestration Potential

1. Modeling and Mapping stage: running Scripts 9-16
2. Hands-on break out room session: applying the methodology to national data

DAY 5 (3h) - Review and Implementation

1. Review and interpretation of the results and QA
2. Hands-on break out room session

How? Framework

- 1 Technical Specifications**
<https://www.fao.org/documents/card/es/c/cb0353en/>
- 2 Technical Manual**
<https://fao-gsp.github.io/GSOCseq/>

Contributors and reviewers

P4WG - Pillar 4 Working Group

INSII - International Network of Soil Information Institutions

ITPS - Intergovernmental Technical Panel on Soils

4per1000 SCT - 4 per 1000 Scientific and Technical Committee

CIRCASA - (Coordination of International Research Cooperation on Soil Carbon Sequestration in Agriculture)

UNCCD-SPI - The UNCCD Science-Policy Interface

...oting sustainable soil management for all

Scope: Agricultural lands
(“Croplands, grasslands” IPCC)

How? Framework

...In a first stage...

Annual crops
Perennial Crops
Integrated crop livestock systems
Perennial sown pastures

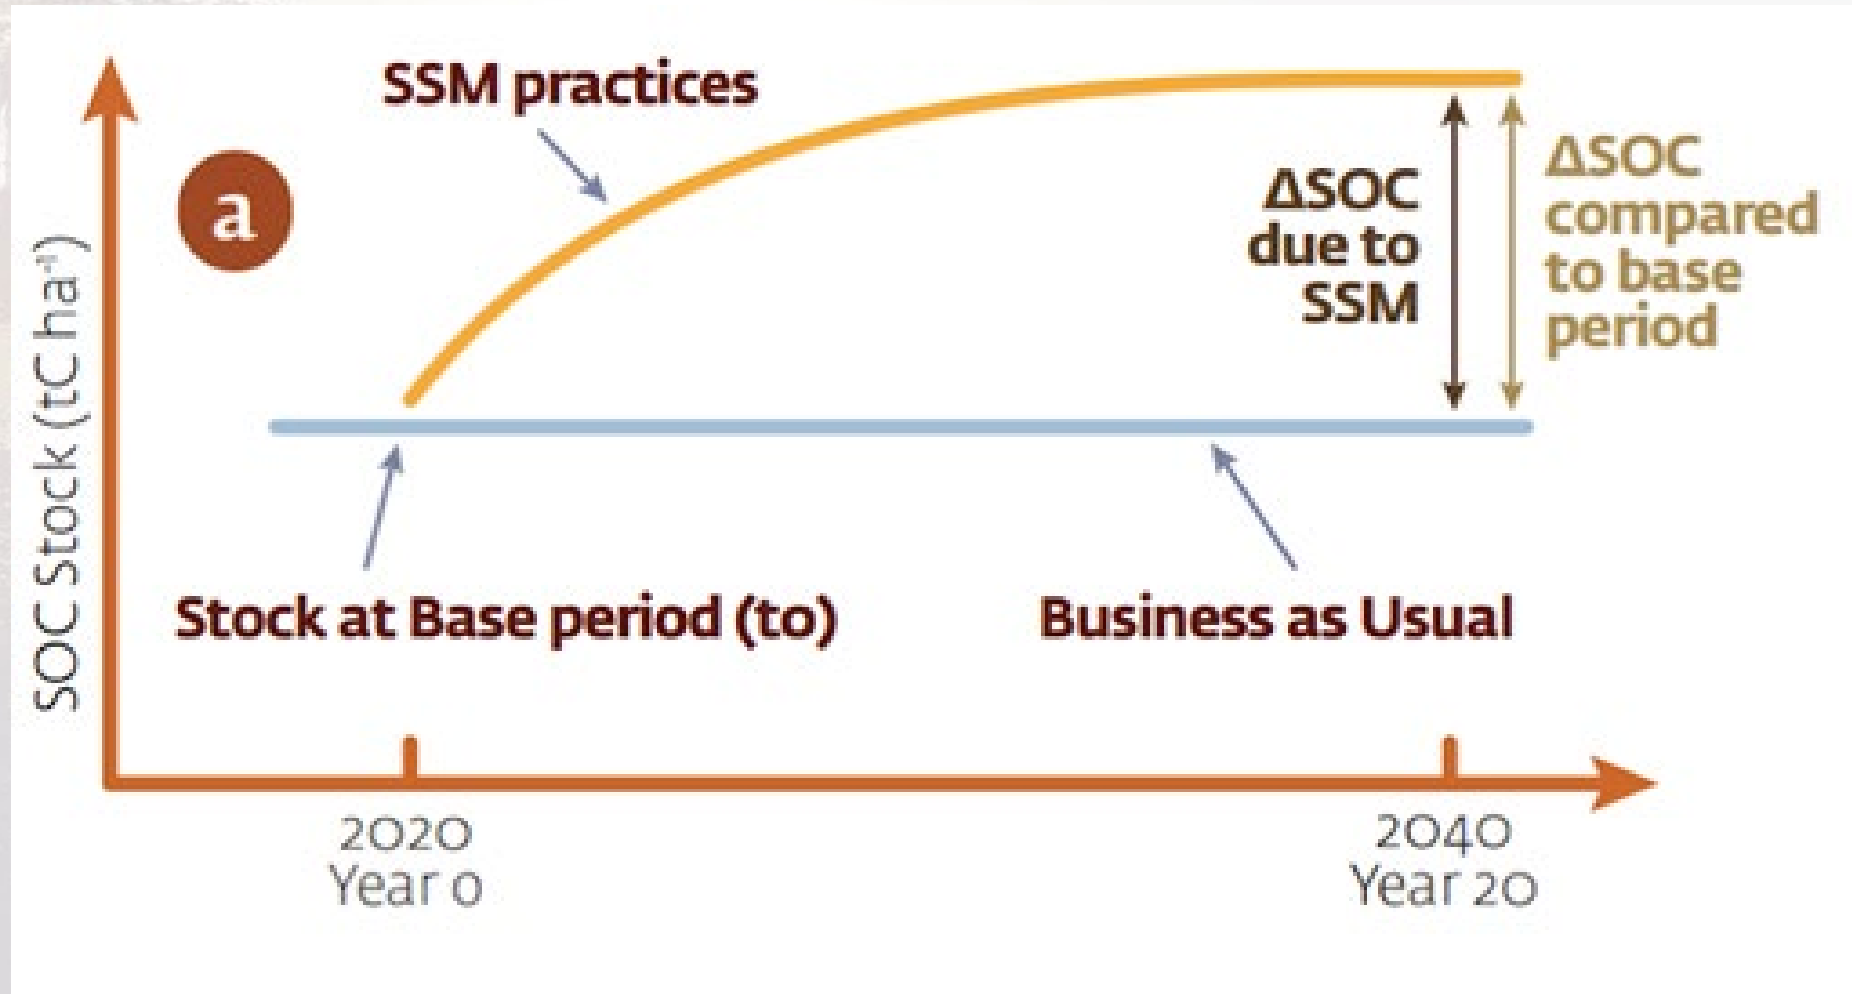

Grasslands, shrublands and savannas
(grazing lands) Agro forestry; silvo
pastoril

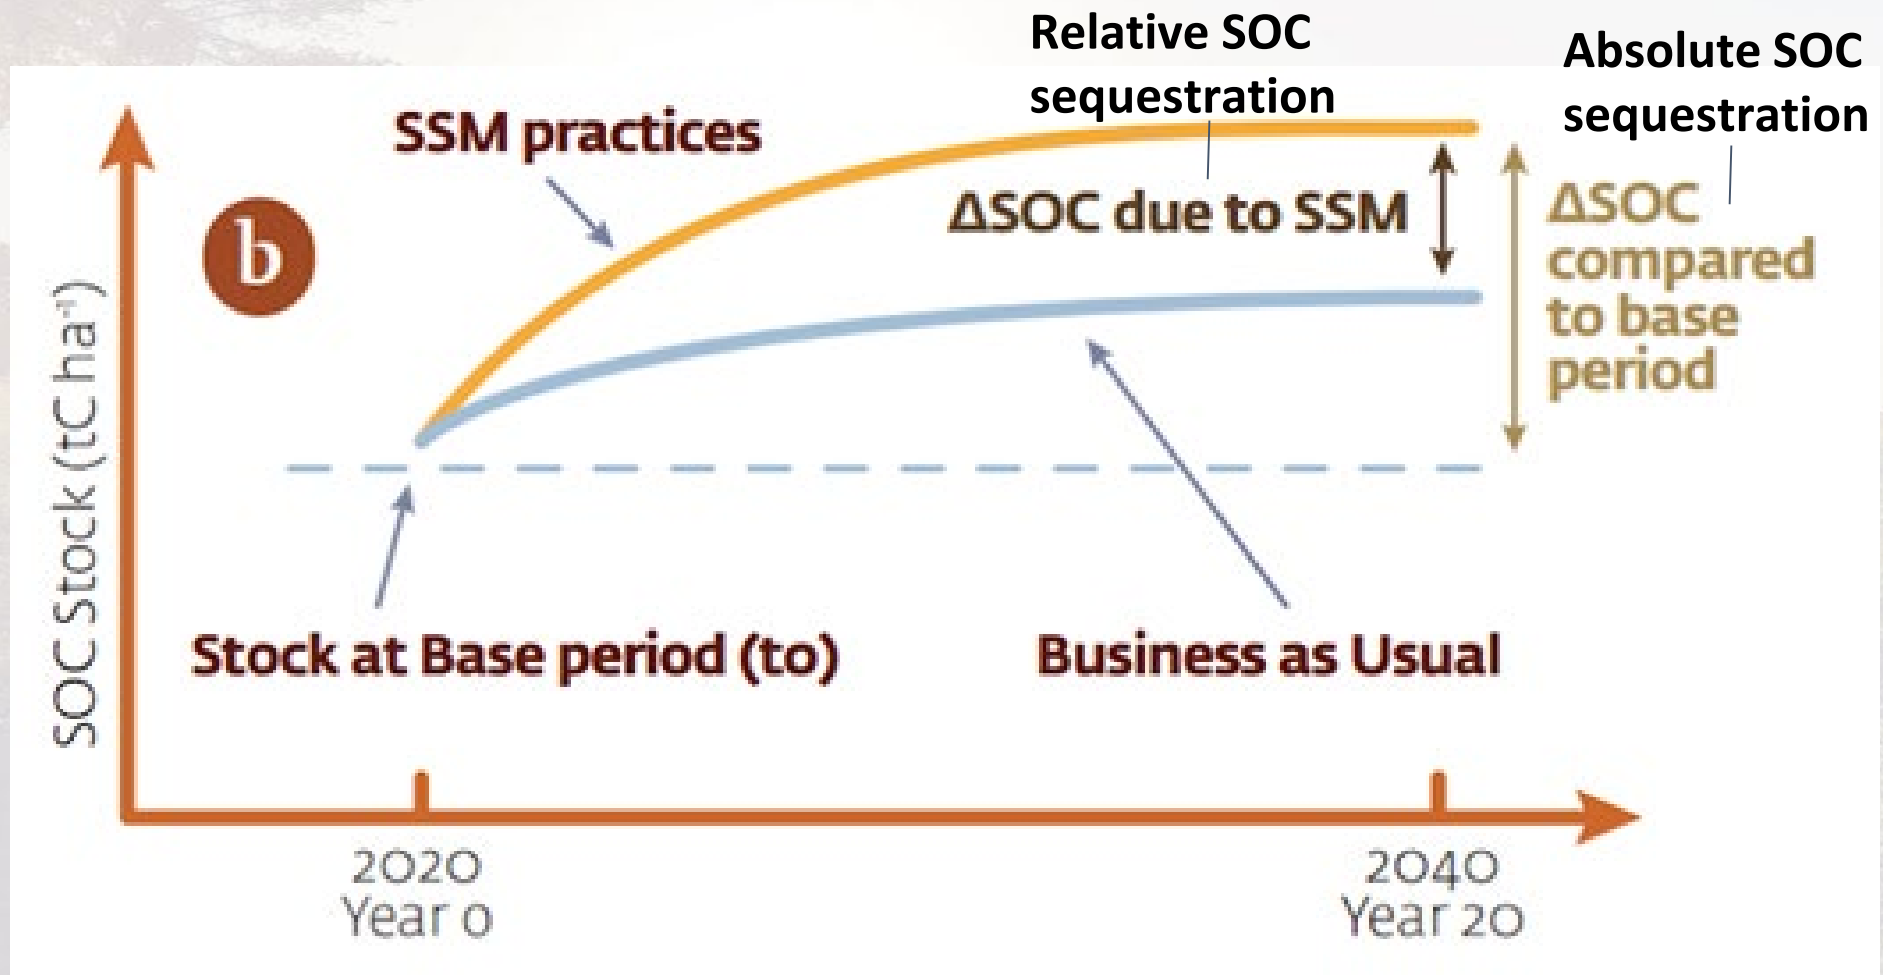

Magnitude of global agricultural area,
Annual management; Higher probability to implement SSM practices
Linked to programmes like RECSOIL (encourage SSM by farmers)

How?

Framework - SOC sequestration

How? Framework

promoting sustainable soil management for all

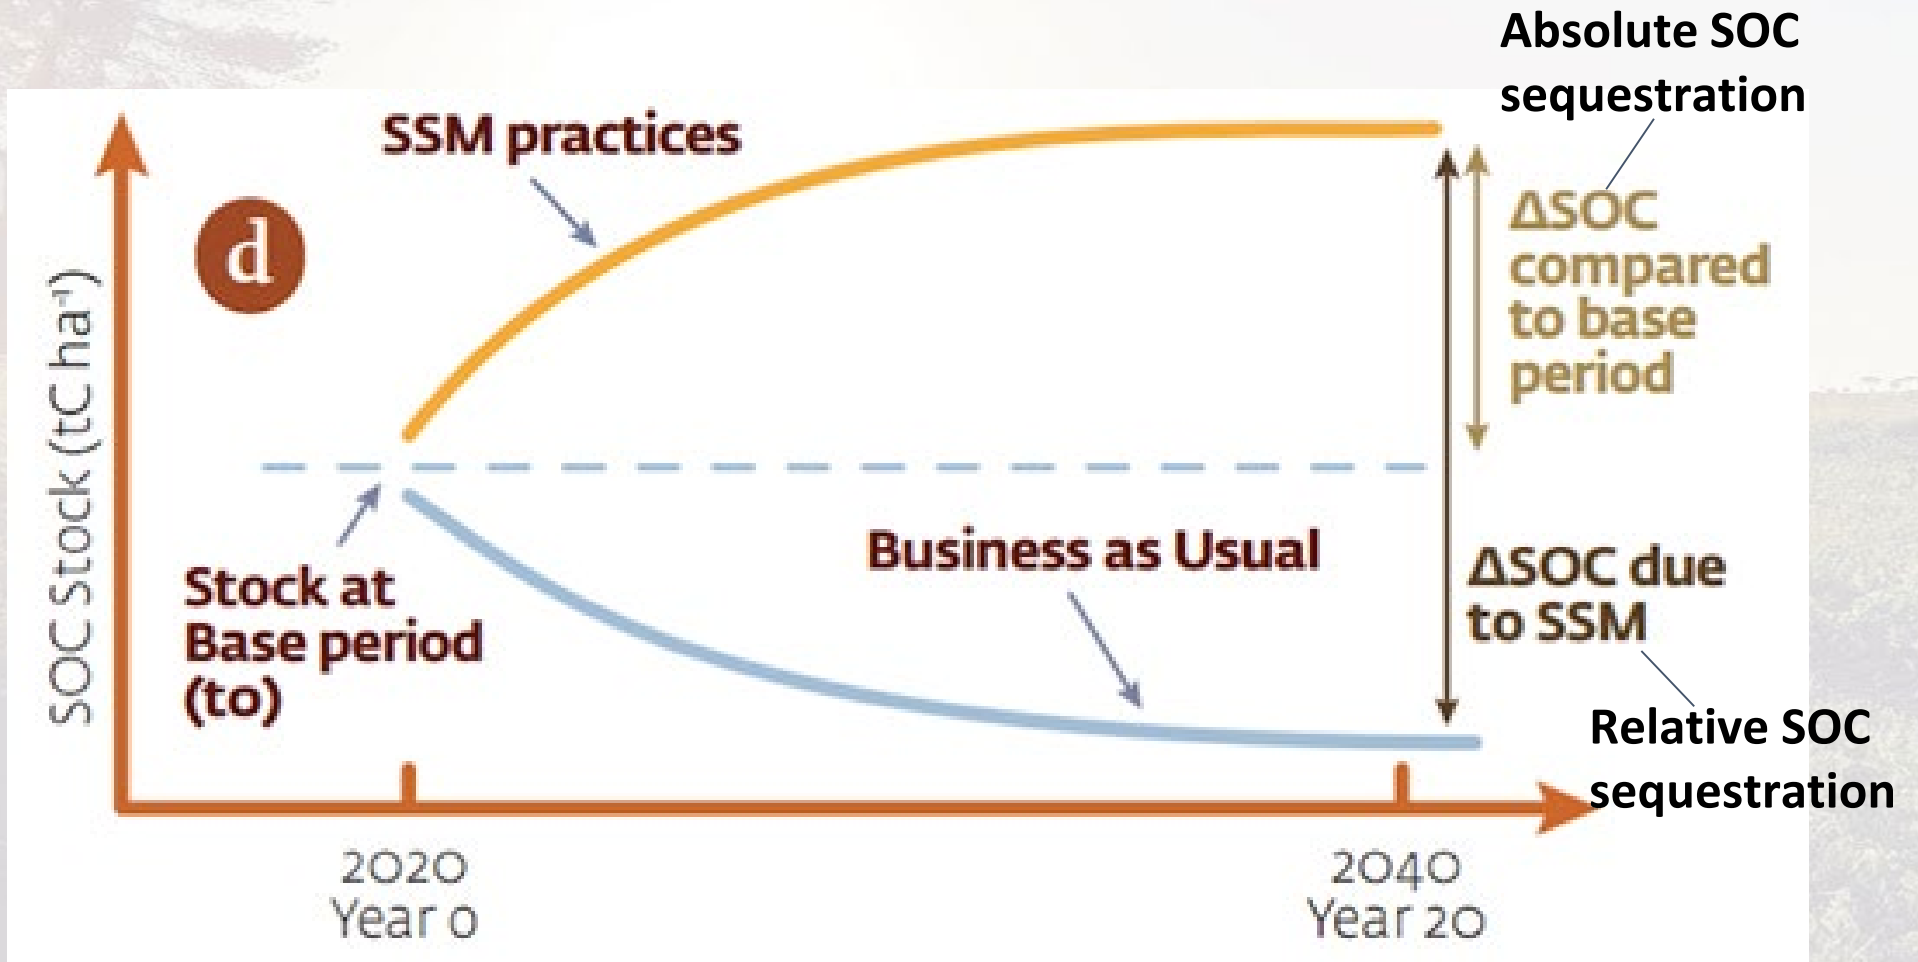

How? Framework

promoting sustainable soil management for all

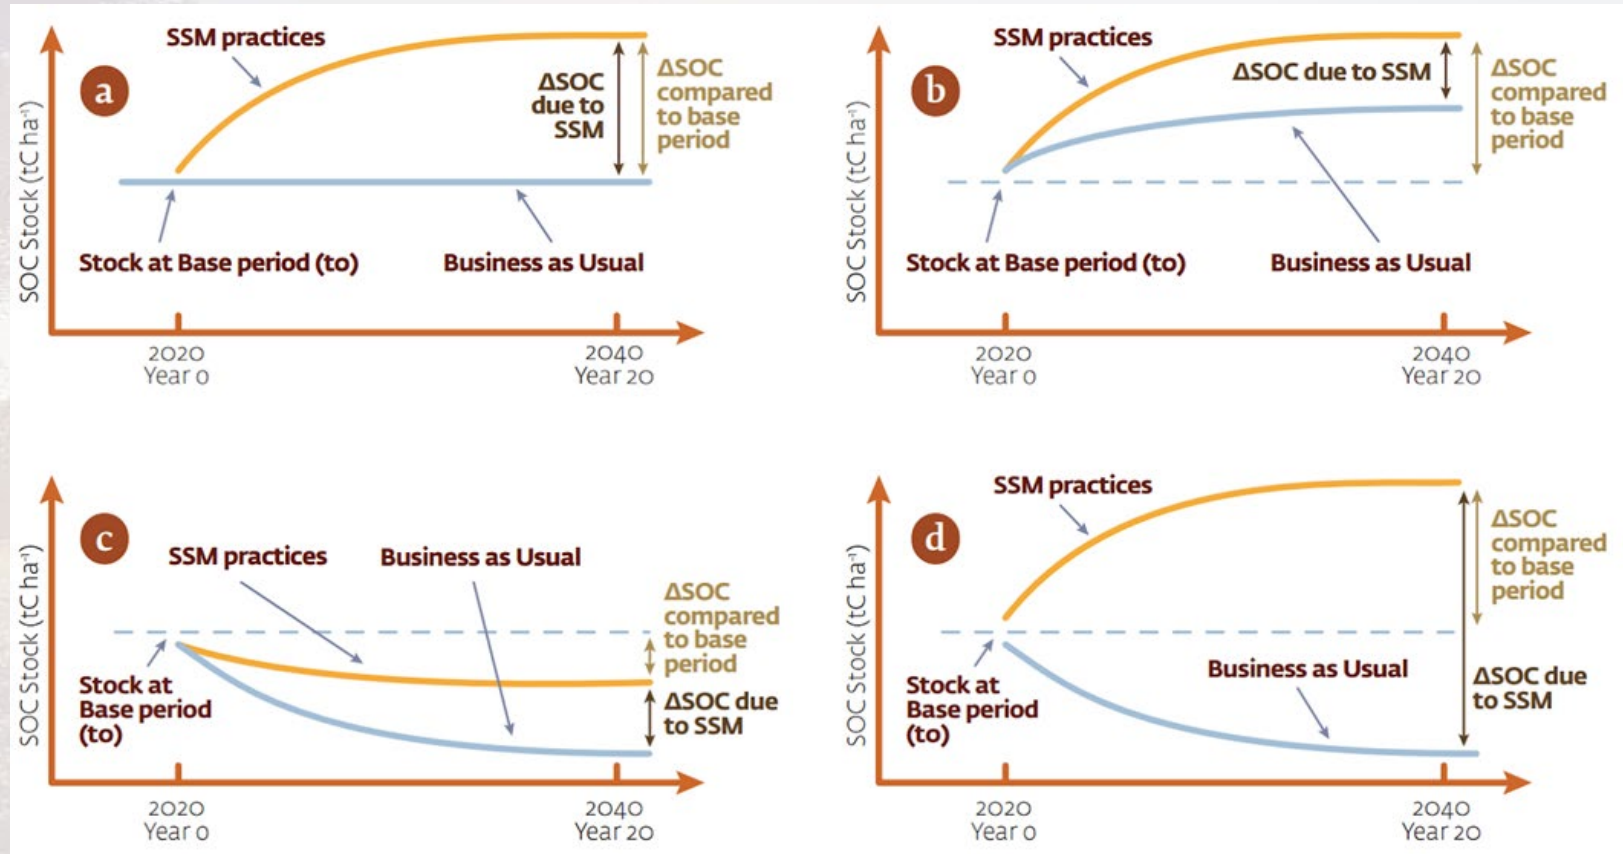

How? Framework

promoting sustainable soil management for all

Absolute and relative SOC sequestration

SOC sequestration (Difference) = Δ SOC in 20 years

Annual Sequestration rate = Δ SOC / 20 years

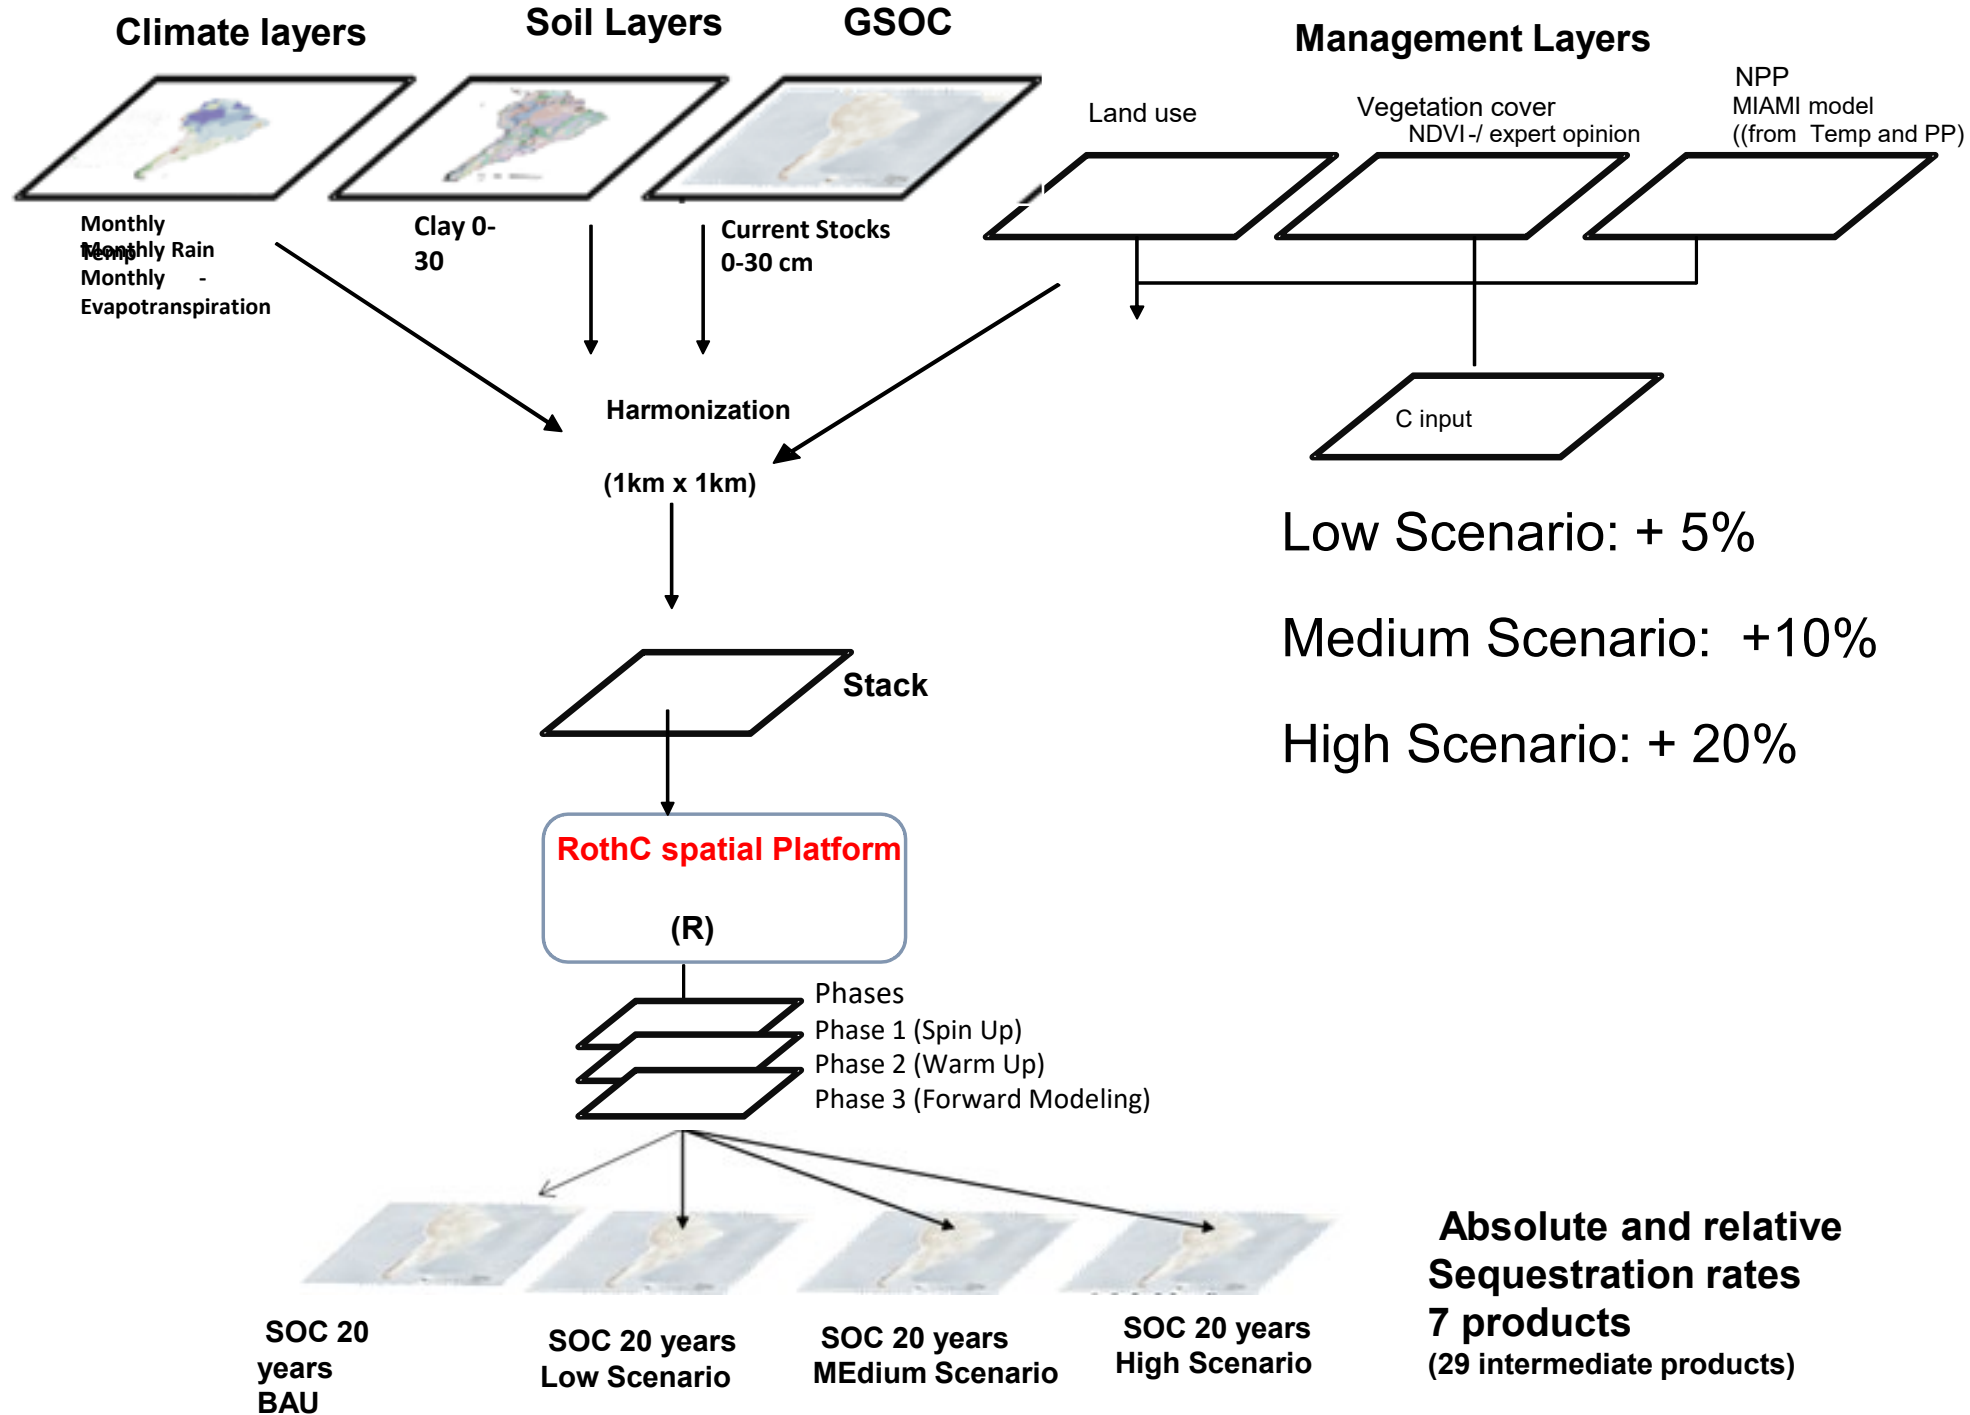

Absolute sequestration rate = (Final SOC SSM 2040– Initial SOC 2020)/ 20 years

Relative Sequestration rate= (Final SOC SSM 2040– Final SOC BAU 2040)/ 20 years

How?

Framework -Summary

- 20-year projection
- After the adoption of SSM that increase C inputs
- 0-30 cm Depth (GSOC, IPCC, Activity data to validate the model)
- Absolute and relative SOC sequestration rates, average 20 years
- In current agricultural lands (Each country can model preferred land uses, restoration, etc.)

Why RothC as standard model?

- **Standard method** among countries (DayCent, Century, ICBM, YASSO,DAISY,AMG, CLM5, etc)
- Fewer **data requirements**; data relative simple to obtain;
- It has been applied across several ecosystems, climate conditions, soils and land use classes;
- Successfully applied at **national, regional and global scales**; e.g. [Smith et al. \(2005\)](#), [Smith et al. \(2007\)](#), [Gottschalk et al. \(2012\)](#), [Wiesmeier et al. \(2014\)](#), [Farina et al. \(2017\)](#), [Mondini et al. \(2018\)](#), [Morais et al.\(2019\)](#);
- It (or its modified/derived version) has been used to estimate carbon dioxide emissions and removals in different **national GHG inventories as a Tier 3 approach**; [Smith et al. \(2020\)](#): Australia (as part of the FullCam model, Japan (modified RothC), Switzerland, and UK (CARBINE, RothC).

promoting sustainable soil management for all

RothC Data requirements

Climate

Soil

Management

Climate Data

1. Monthly rainfall(mm)
2. Average monthly mean air temperature (°C)
3. Monthly open pan evaporation (mm)/evapotranspiration (mm)

Soil Data

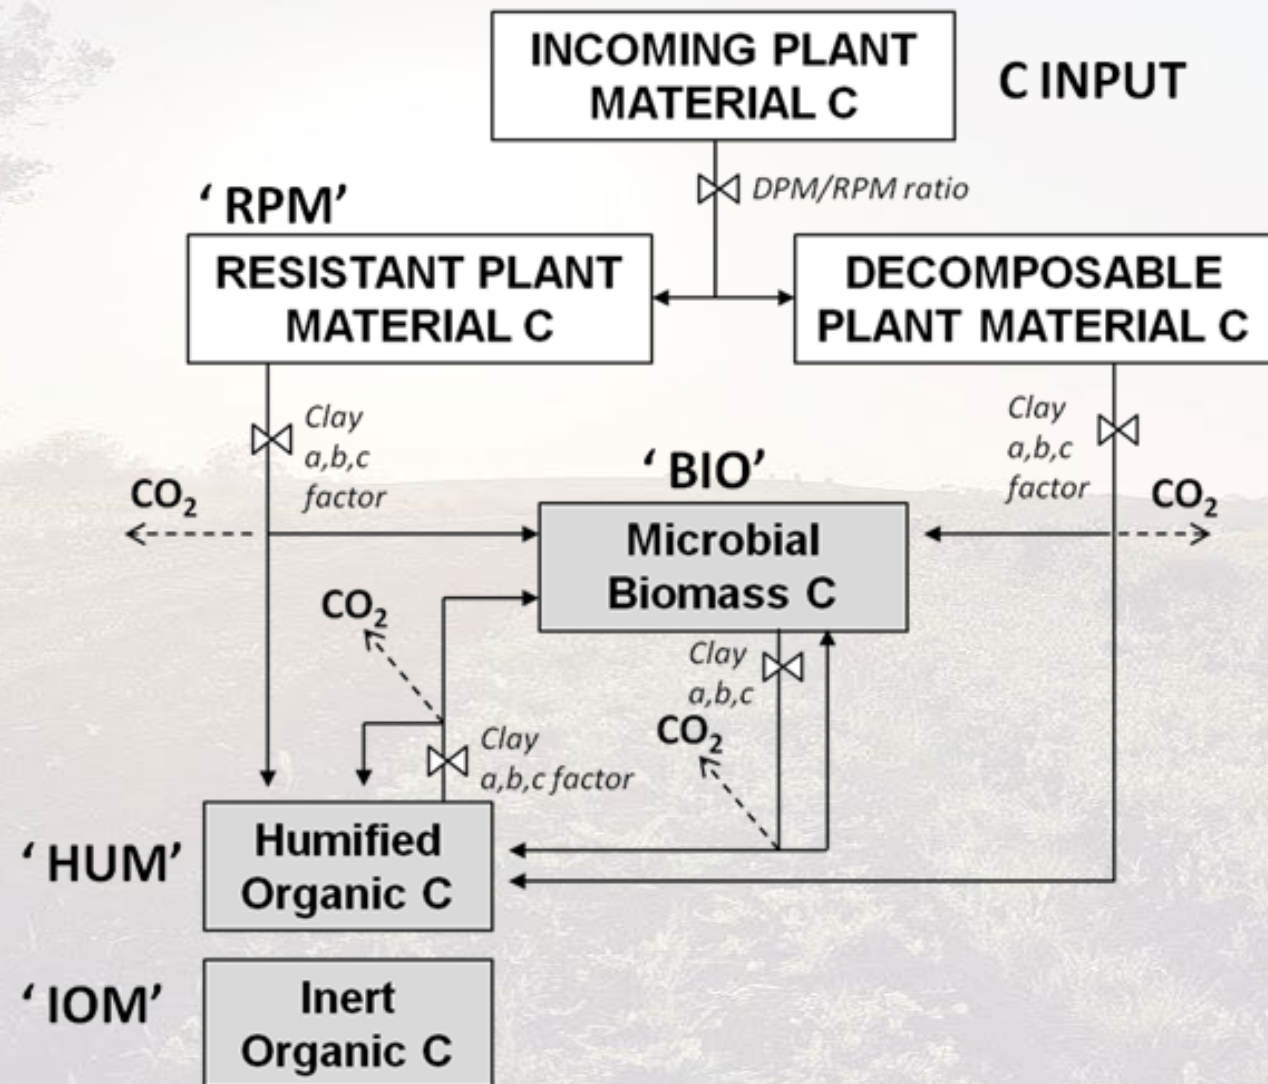

1. Total initial 0-30cm SOC stocks (t C ha⁻¹)
2. Initial C stocks of the different pools (t C ha⁻¹): DPM, RPM, BIO, HUM, IOM
3. Clay content (%) at simulation depth.

Land Use- Management Data

1. Monthly Soil cover (binary: bare vs. vegetated)
2. Irrigation (to be added to rainfall amounts)
3. Monthly Carbon inputs from plant residues (aboveground + belowground), (t C ha⁻¹)
4. Monthly Carbon inputs from organic fertilizers and grazing animals' excretion (t C ha⁻¹)
5. DPM/RPM ratio, an estimate of the decomposability of the incoming plant material

2. Country driven Approach

RothC

promoting sustainable soil management for all

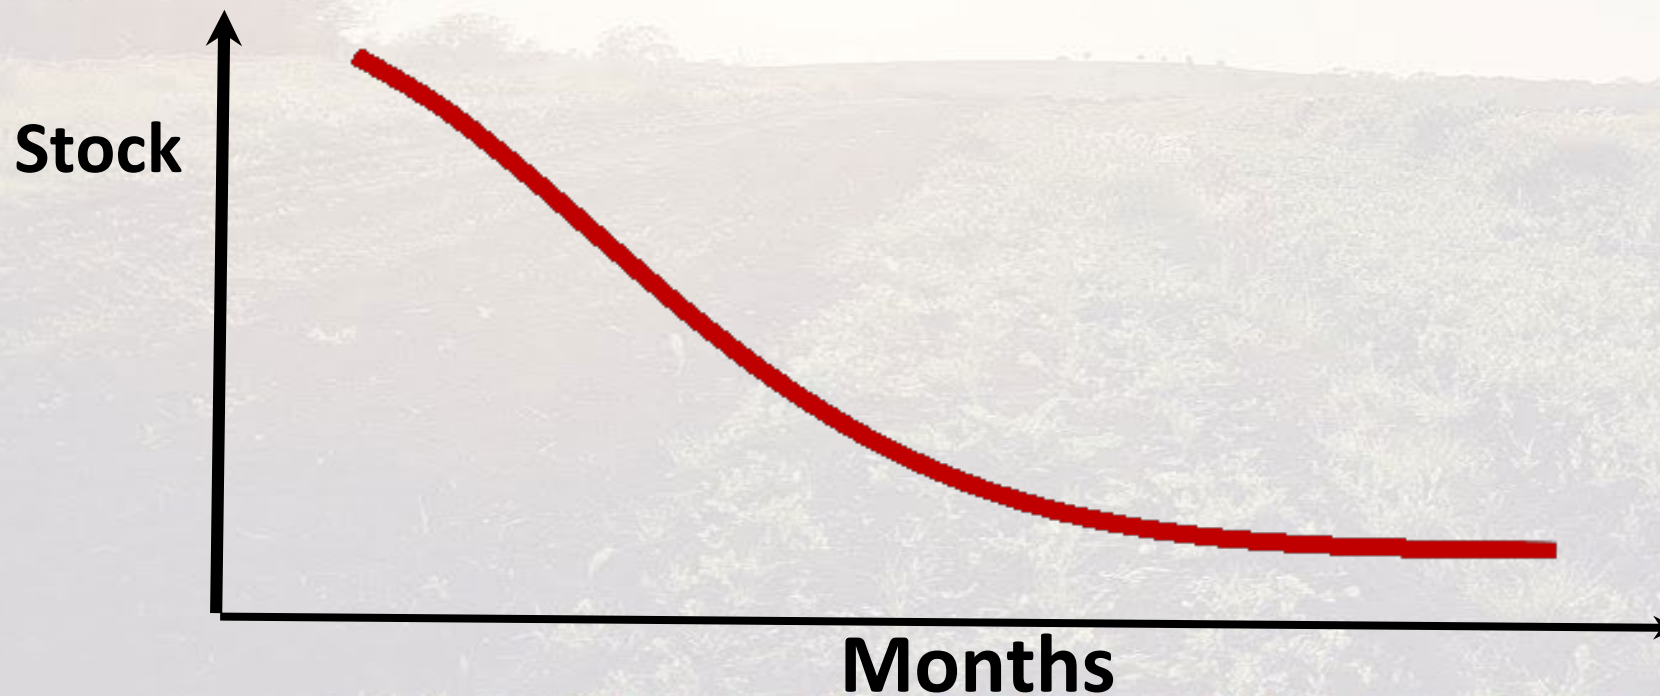

SOC dynamics in RothC

The amount of SOC of each pool (Y) decomposes following an **exponential decay function**:

$$Y \cdot e^{-kt}$$

k = annual decomposition constant
t = time, months 1/12 (0,083)

promoting sustainable soil management for all

Decomposition rates

Constants (k), in years⁻¹, different for each pool:

- DPM (decomposable plant mat): **10.0** 0.1 years (turnover time)
- RPM (resistant plant material): **0.3**3.3 years
- BIO (microbial biomass): **0.66** 1.5 years
- HUM (Humified organic C) : **0.02** 50 years
- IOM (Inert)0.000000 α

SOC dynamics in RothC

... These **k** are affected by different factors:

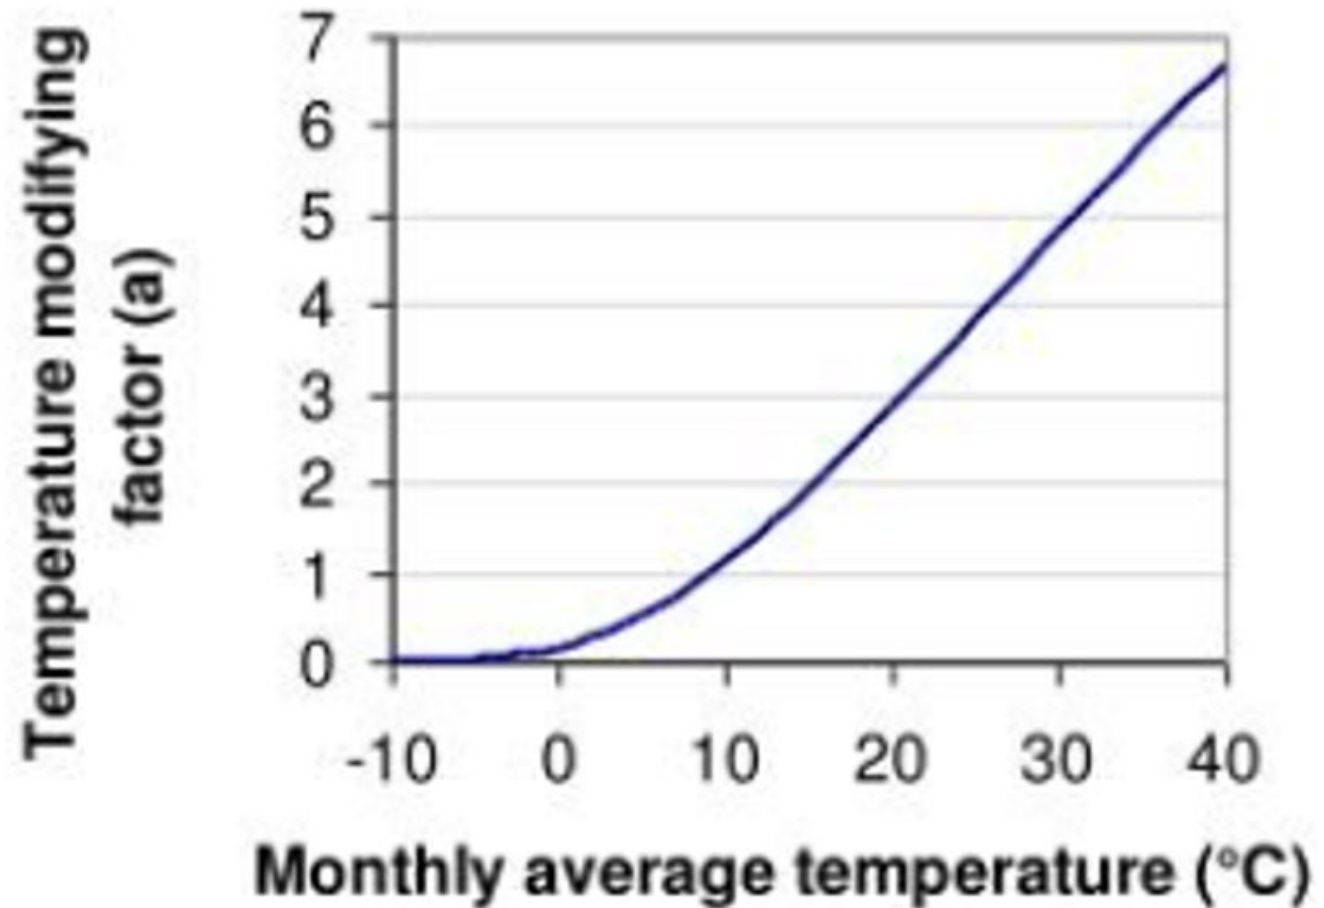

$$Y \cdot e^{-kt} \quad \longrightarrow \quad Y \cdot e^{-k \cdot a \cdot b \cdot c \cdot t}$$

a= temperature factor

b= soil moisture factor

c= soil cover factor

Temperature factor (a)

> Temperature,
> decomposition
rate

From: CSIRO: 2008

promoting sustainable soil management for all

Soil moisture factor (b)

for all

Soil/vegetation cover factor (c)

If soil is vegetated $c=0.6$

If soil is bare $c=1.0$

If Vegetated, **Lower “c”** Lower decomposition rate

July
No crops
Bare;
 $c=1.0$

January
Growing
crops
veg.;
 $c=0.6$

promoting sustainable soil management for all

Example RothC Japan – Paddy Rice - waterlogged soils

Modifying factor
for paddy rice

0.6 x k months no
flooded rice
0.2 x k with
flooded Rice

Paddy rice
modifying
factor

$G_{SOCseq} =$
0.4 x k

The model underestimated SOC, as expected
(slower decomposition because of anaerobic condition)

From: Yirato y Yagasaki. NIAES

(Shirato & Yokozawa, 2005)

promoting sustainable soil management for all

Soil texture

Clay% ... affects the proportion of C from each pool that is released as **CO₂** or to **Soil organic carbon pools**

- From that... **46 % goes to BIO; 54% goes to HUM**

DPM/RPM... “Decomposability of C inputs”

C inputs split between DPM and RPM

Default values...

- Crops and improved pastures...

DPM/RPM = 1.44 (59% is DPM, 41% is RPM)

- Grasslands, shrublands/savannas

DPM/RPM = 0.67 (41% is DPM; 59% is RPM)

Tree crops

variable...DPM/RPM = 1.44; 0.67; 0.35

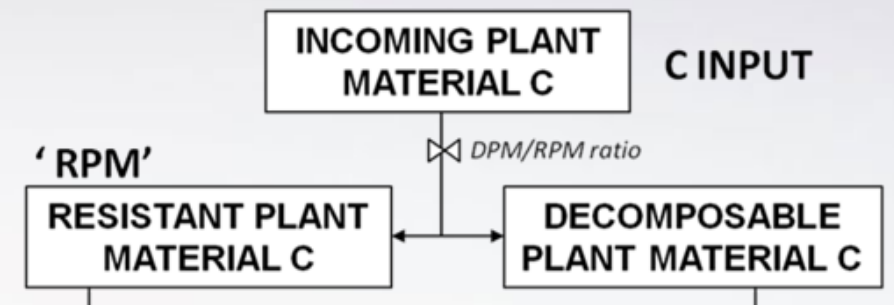

(Morais et al 2019;Farina et al 2017)

- Forests (deciduous, tropical)...

DPM/RPM =0.25 (20% is DPM y 80% is RPM)

- Manure...

DPM/RPM =1 (49% is DPM; 49% is RPM ; 2%HUM)

- Depends on Land Use
- Can be modified

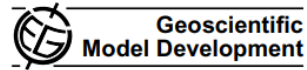

promoting sustainable soil management for all

Soil R site:

<https://www.bgc-jena.mpg.de/TEE/software/soilr/>

- SoilR- simplified version of RothC – Higher speed, adapted to simulate multiple objects (e.g. 1 km x 1 km)
- Transparent, R language, can be modified
- Open Software (R)
- SoilR, already integrates other SOC models (e.g. ICBM, Century)...to perform model ensemble approach

promoting sustainable soil management for all

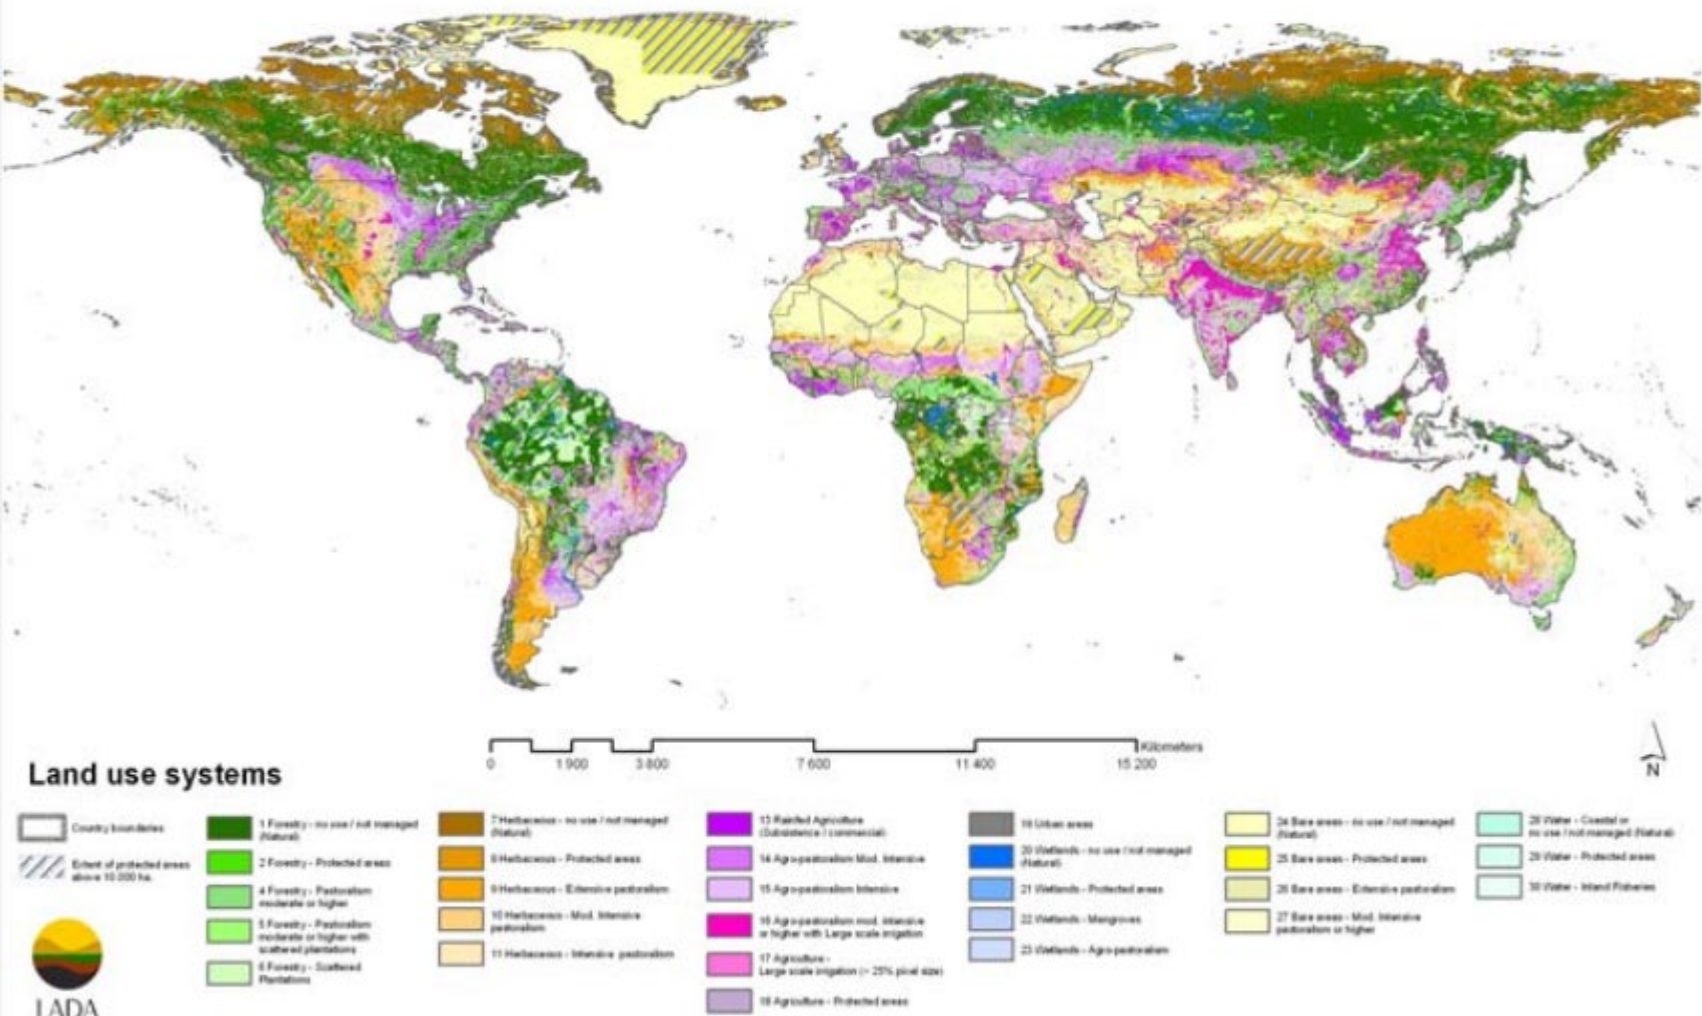

Spatial Version RothC Soil-R

- GSP: We provide a tool based in R language using Soil R – RothC functions
- Each country can improve and modify the tool, develop their own tool (using Roth C to generate the standard products in a first stage)
- **Countries are encouraged to provide additional (‘non-standard’) sequestration maps, using modifications/adaptations, alternative approaches, other models**

How to harmonize and model thousands of different practices, often combined? ...Specially with limited data

SSM? Land use systems of the world

... First stage...

Practices that increase C inputs

3 scenarios:

- +5% increase Ci
- +10% increase Ci
- +20% increase Ci

Conservative ranges...may be high for other systems

based on Smith, 2004; Wiesmeier et al., 2016

Standard Products

promoting sustainable soil management for all

Non-Standard Products Using modified coefficients

promoting sustainable soil management for all

To simulate SOC changes for each 1km x 1km pixel:

Based on Smith et al 2006; 2008; Gottschalk et al 2012

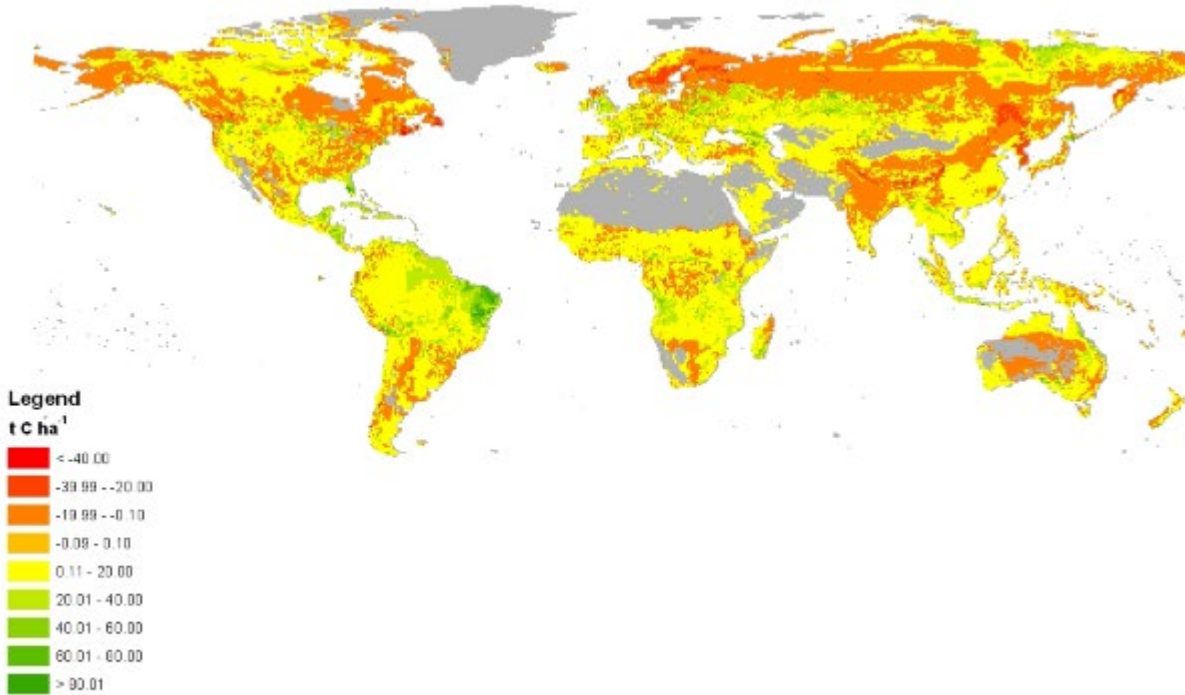

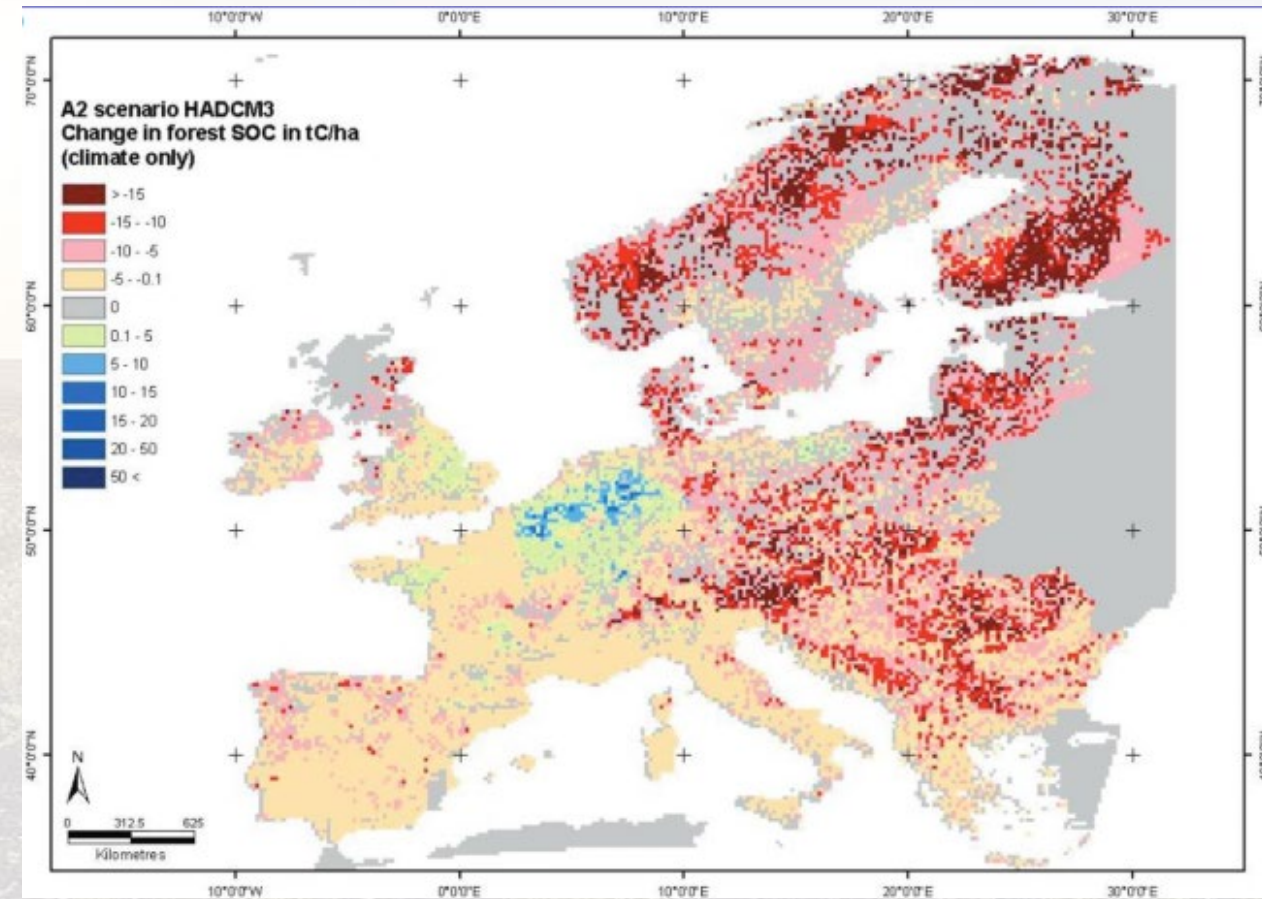

Fig. 7. Average trend in SOC concentration of all 10 scenarios from 1971 to 2100.

Gottschalk et al 2012

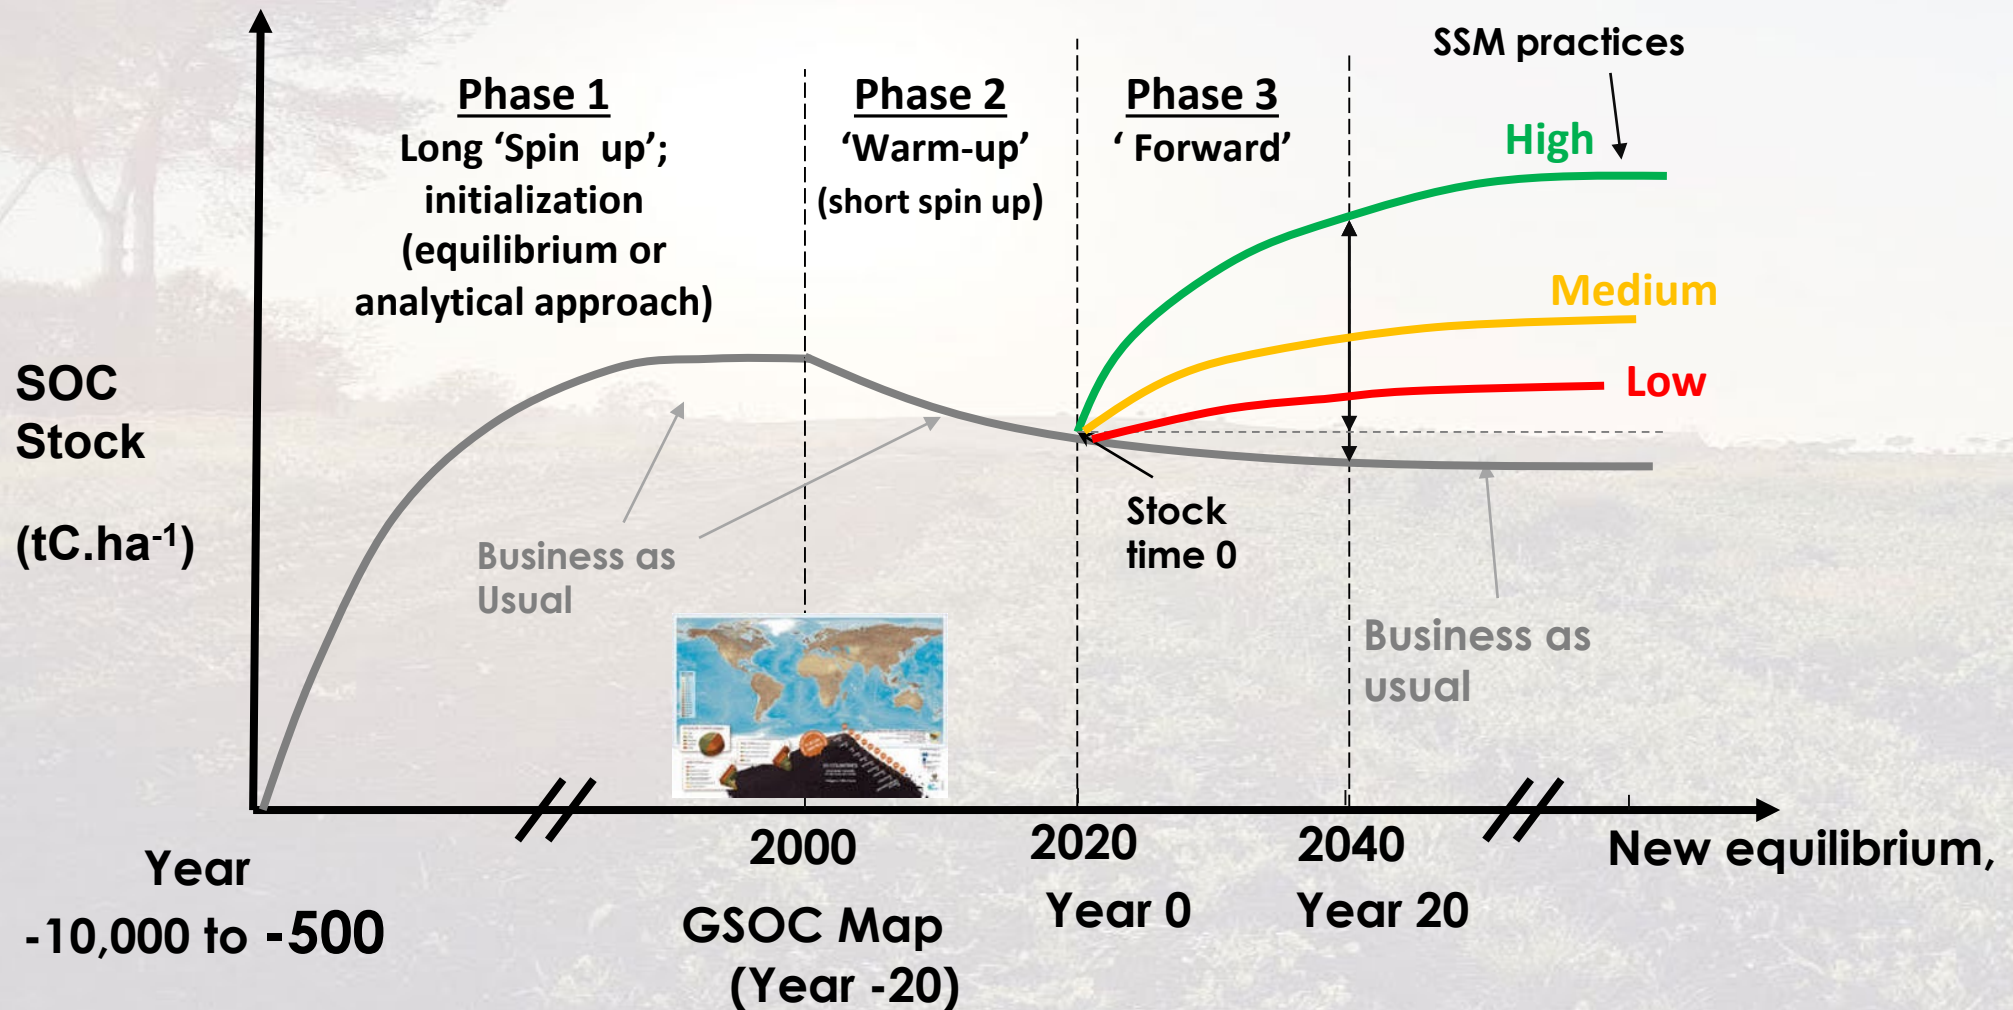

Smith et al 2006

promoting sustainable soil management for all

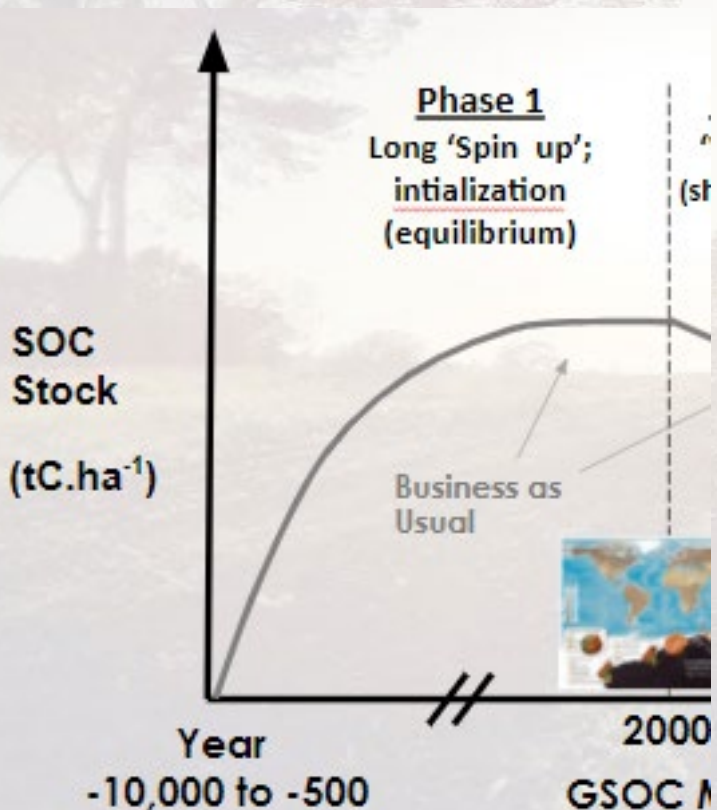

For each 1km x 1km pixel:

Approach based on Smith et al 2006; 2008; Gottschalk et al. 2012

Phase 1 . Spin up

- Initialization phase

Required to:

- obtain C stocks of different pools (BIO, HUM, DPM, RPM, etc)
- Estimate baseline C-inputs (C inputs required to reach GSOC stocks) (referred as C_{eq})

C_{eq} = C inputs under business as usual/baseline

Procedure:

Model is run for a long time span (e.g. 500 years) using historic climate (1980-2000)... first using a fixed C input (1 t)... C inputs are adjusted until SOC stock = GSOC map:

- $C_{eq} = C_i \times [(C_{meas} - IOM) / (C_{sim} - IOM)]$

Phase 2 . Warm up – Short Spin up (18-20 years)

Required to:

- Adjust climate variation between 2000-2020
- Harmonize major time differences in GSOC map FAO (generated soil profiles 1960-2000s)... current
- Adjust Land use changes 2000-2020
- Adjust over or under estimation in C stocks of a specific pool (E.g. High DPM)
- Not necessary if current SOC stocks = GSOC

Procedure

- The model is run for 18-20 years using monthly climate data, year to year (2001-2020)
- Annual C inputs are corrected according to annual changes in NPP

promoting sustainable soil management for all

Phase 2 . Warm up – Short Spin up (Cont.)

- Annual NPP to adjust year to year C inputs
- NPP by MIAMI Model (Lieth, 1972; Gottschalk et al., 2012)
- Other preferred NPP sources/models can be used

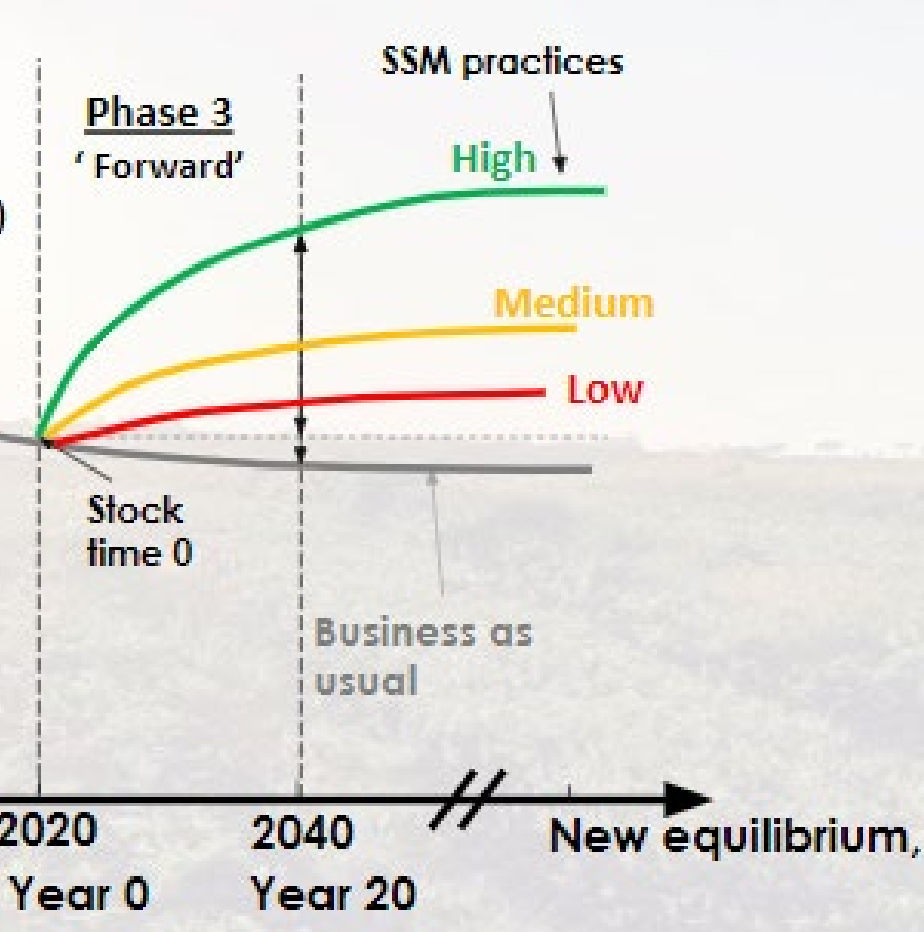

NPP can be adjusted for Land Use changes (Schulze et al 2010)

$$\text{NPpt}_{\text{forests}} = \text{NPP}_{\text{MIAMI}} \times 0.88$$

$$\text{NPpt}_{\text{grasslands}} = \text{NPP}_{\text{MIAMI}} \times 0.72$$

$$\text{NPpt}_{\text{croplands}} = \text{NPP}_{\text{MIAMI}} \times 0.53$$

Phase 3 . Forward run (2020 – 2040)

- **Required to:**

- Obtain SOC stocks in different SSM scenarios after 20 years
- Estimate SOC sequestration rates

Procedure:

- Model is run for 20 years using average climate 2000-2020
- (Future versions include climate change... decide scenarios)
- **The 4 scenarios are run:**
 - **BAU**
 - **SSM1 ('Low increase') (+ 5% in C)**
 - **SSM 2 ('Medium increase') : (+10%)**
 - **SSM 3 ('High increase') : (+20%)**

Validation and uncertainties

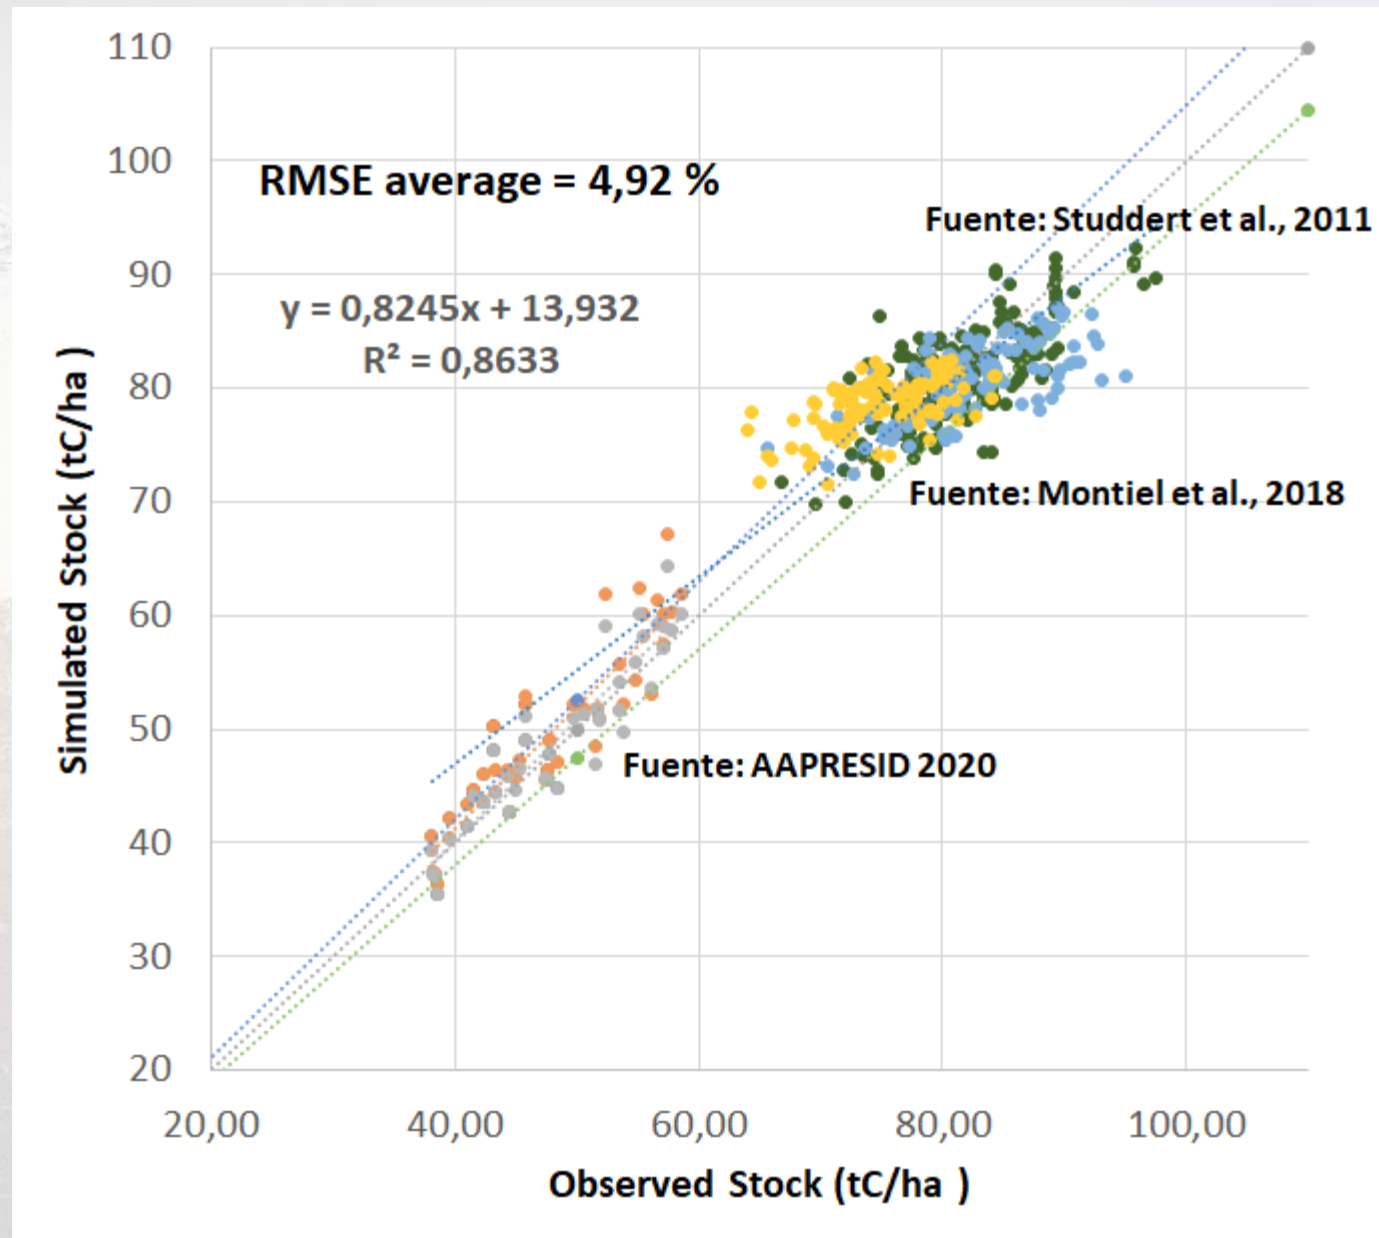

Difficulties

- Validate changes that did not happen yet?
- Complex methods (e.g. Montecarlo) require multiple simulations (computational time)
- Data availability, uncertainty in input layers
- **We require to estimate uncertainties with limited computational and data resources**

1st Step

Model evaluation
with pre-existent
data

Meta-anlysis
local studies

promoting sustainable soil management for all

$$U (\%) = 100 * (UL \text{ CI} - LL \text{ CI}) / (2 * SOC_{av})$$

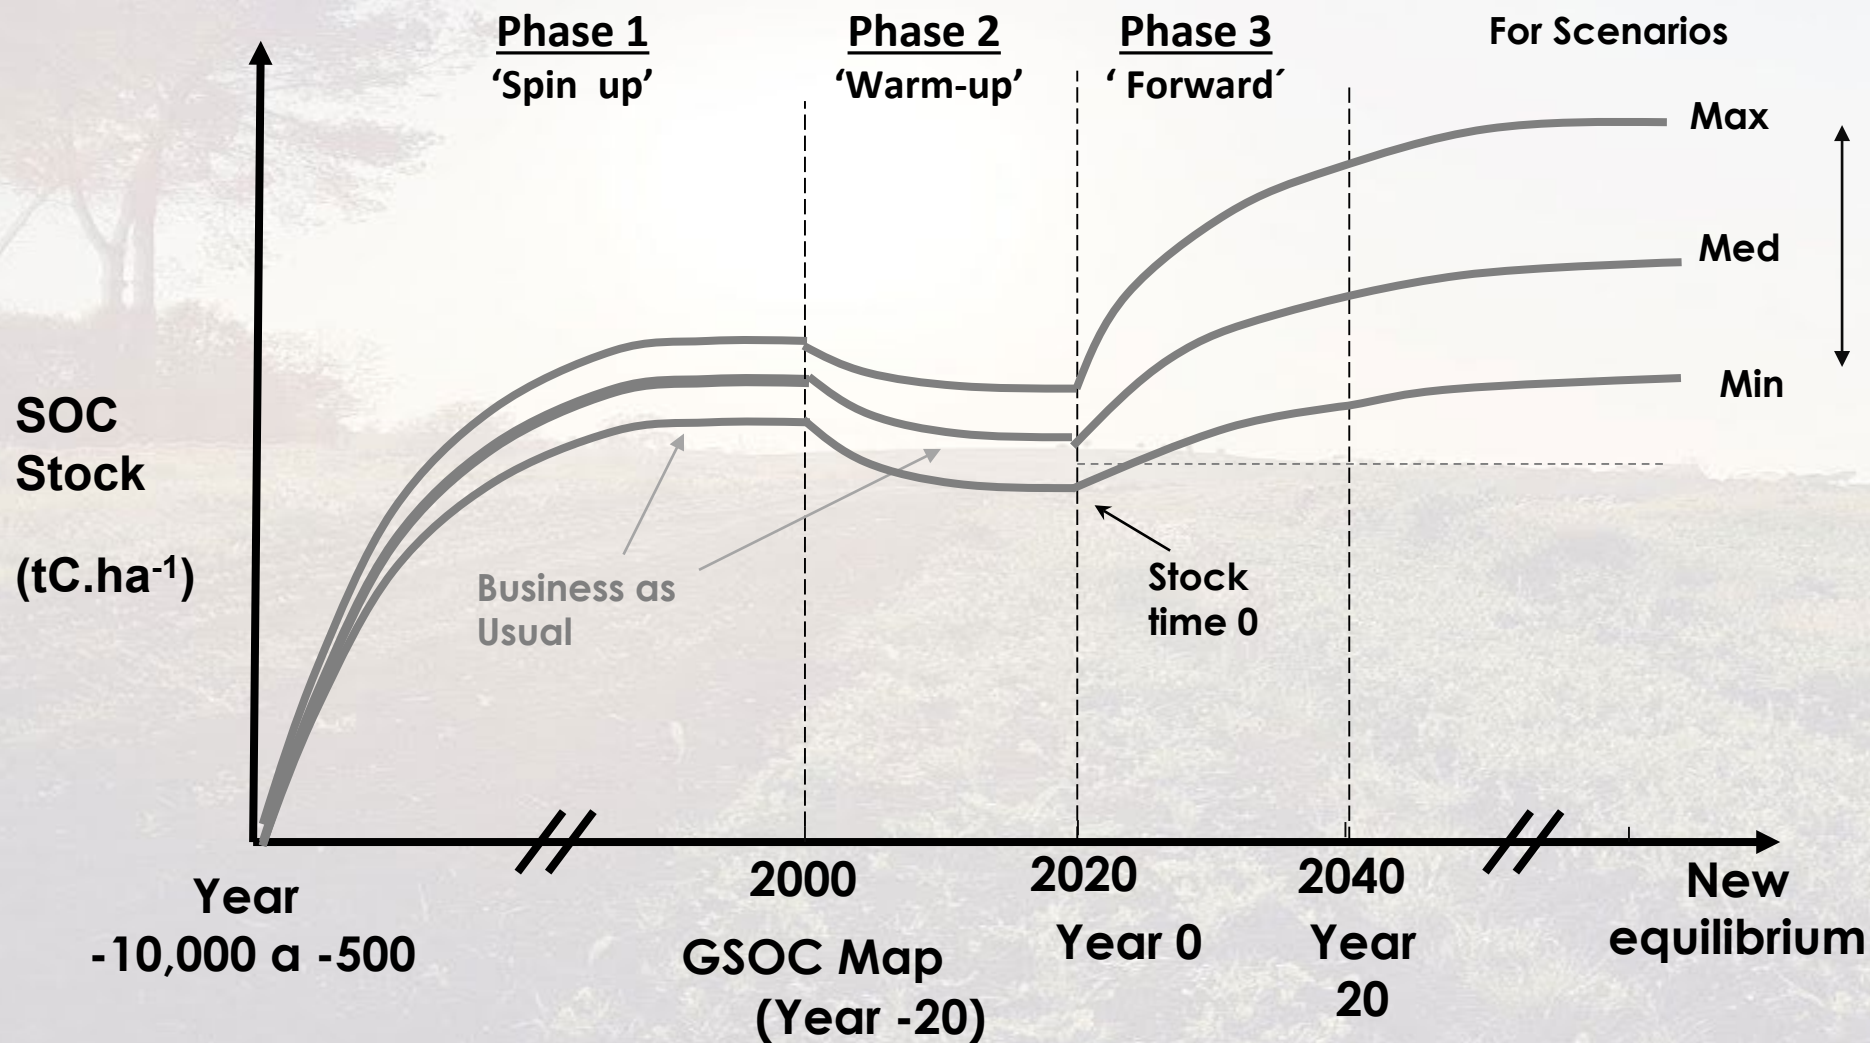

UL = upper limit of the 95% confidence interval of the estimated SOC at the end of the simulation (in t C.ha⁻¹),
LL = lower limit of the 95% confidence interval of the estimated SOC at the end of the simulation (in t C.ha⁻¹); a
SOC_{av} = the average of the estimated SOC at the end of the simulation (t C.ha⁻¹)

VCS 2012

SOC max/UL = Model (SOC FAO max, Ci max, Temp min, Pp max, Clay max)

SOC min/LL = Model (SOC FAO min, Ci min, Temp max, Pp min, Clay min)

General Uncertainties

promoting sustainable soil management for all

Uncertainties

If information on uncertainty of layer for each pixel 1 km x 1km (SOC, FAO, PP, Clay, Temp, etc):

$$P_{\min} = X_p - 1.96 \times SE_p$$

$$P_{\max} = X_p + 1.96 \times SE_p$$

And run model changing Input Layers (using Pmin, y Pmax)

If NO information on the uncertainties of each layer, use general variation (> % uncertainties...)

General uncertainties of main parameters affecting SOC dynamics. Derived from Gottschalk et al. (2007) and Hastings et al. (2010).

Parameter	Uncertainty in the input	Minimum value	Maximum value
Temperature	± 2 %	Monthly Temp * 0.98	Monthly Temp * 1.02
Precipitation	± 5 %	Monthly PP * 0.95	Monthly PP * 1.05
Clay content	± 10 %	Clay * 0.90	Clay * 1.10
FAO SOC	± 20 %	SOC FAO * 0.8	SOC FAO * 1.2
C input increase in SSM scenario	± 15 %	C eq * (SSM1 % increase - 15%)	C eq * (SSM % increase + 15%)

Limitations

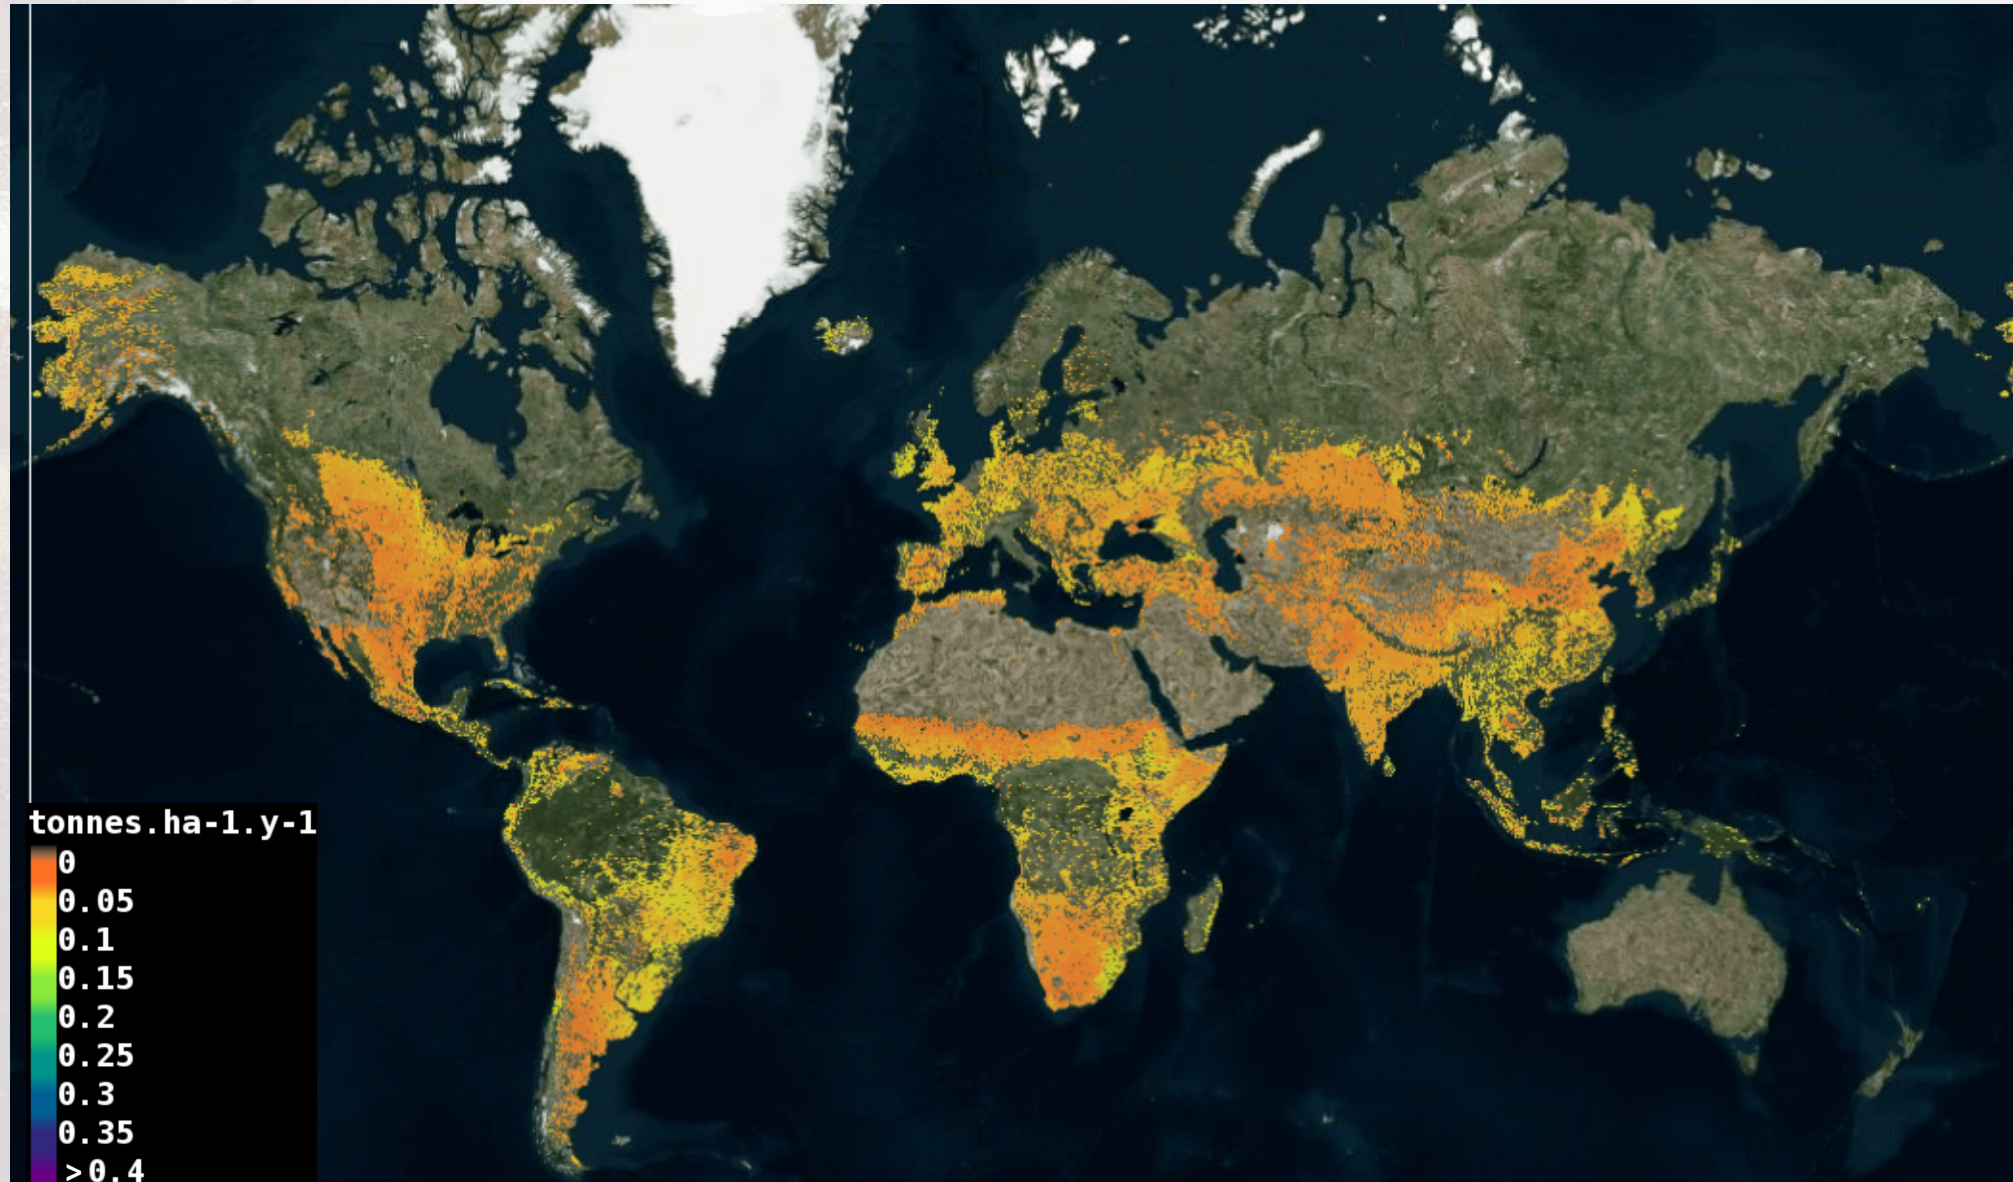

- Models= simplifications of reality
- No universal models
- Erosion, Clay type? soil nutrients effects?
- pH? Bases?
- aridic soils? Sodic soils? Salt affected?
- red-ox potential; waterlogging, anaerobiosis; organic soils?
- micro and meso fauna effects?
- Soil structure ? Soil compaction?
- Among others!!!!

... But we need an initial step...

Climate Data

- Monthly 1981-2000:

Spin UP

- Precipitation (mm/month) 12 layers (one per month)
 - Air Temperature (°C) 12 layers (one per month)
 - Potential Evapotranspiration (mm/month) 12 layers (one per month)
- MIAMI model
 - Precipitation (mm/year) 20 layers (one per year) or 240 layers (one per month per year) (CRU layer arrangement)
 - Temperature (°C) 20 layers (one per year) or 240 layers (one per month per year) (CRU layer arrangement)

Climate Data

- Monthly From 2001-2018/20
- Warm Up
 - Precipitation (mm/month) 216-240 layers (one per month per year) (CRU layer arrangement)
 - Temperature (°C) 216-240 layers (one per month per year) (CRU layer arrangement)
 - Potential Evapotranspiration (mm/month) 216-240 layers (one per month per year) (CRU layer arrangement)
- Forward
 - Precipitation (mm/month) 12 layers (one per month)
 - Temperature (°C) 12 layers (one per month)
 - Potential Evapotranspiration (mm/month) 12 layers (one per month)

<http://www.cru.uea.ac.uk/>

The screenshot shows the website for the University of East Anglia's Climatic Research Unit (CRU). The browser address bar displays "No es seguro | cru.uea.ac.uk". The website header includes the UEA logo, the text "University of East Anglia", and "Climatic Research Unit" with the CRU logo. A navigation menu contains links for Home, About CRU, Data, Academic Programmes, Research, Staff and Students, Information Sheets, Publications, Media, and News/Events.

Home

The aim of the Climatic Research Unit (CRU) is to improve scientific understanding of the climate system and its interactions with society.

Our research is directed towards answering these key questions:

- How and why does our climate change – past, present and future – and what are the implications?
- How can we quantify, reduce and communicate the uncertainty in the climate information that is developed for society?

Global air temperature
2019 anomaly +0.74°C
(3rd warmest on record)

[Explore temperature and other datasets](#)

At the bottom of the browser window, a taskbar shows a search bar with the text "Escribe aquí para buscar", system icons for network, volume, and battery, and a clock showing "12:23 09/06/2020".

Promoting sustainable soil management for all

Additional global climate data set

GEE and R scripts

- TerraClimate is a dataset of monthly climate for global terrestrial surfaces from 1958-2019
- monthly temporal resolution and a ~4-km
- GEE and R scripts to download and prepare the data for you AOI will be provided soon

promoting sustainable soil management for all

Summary. Inputs for the 3 Phases

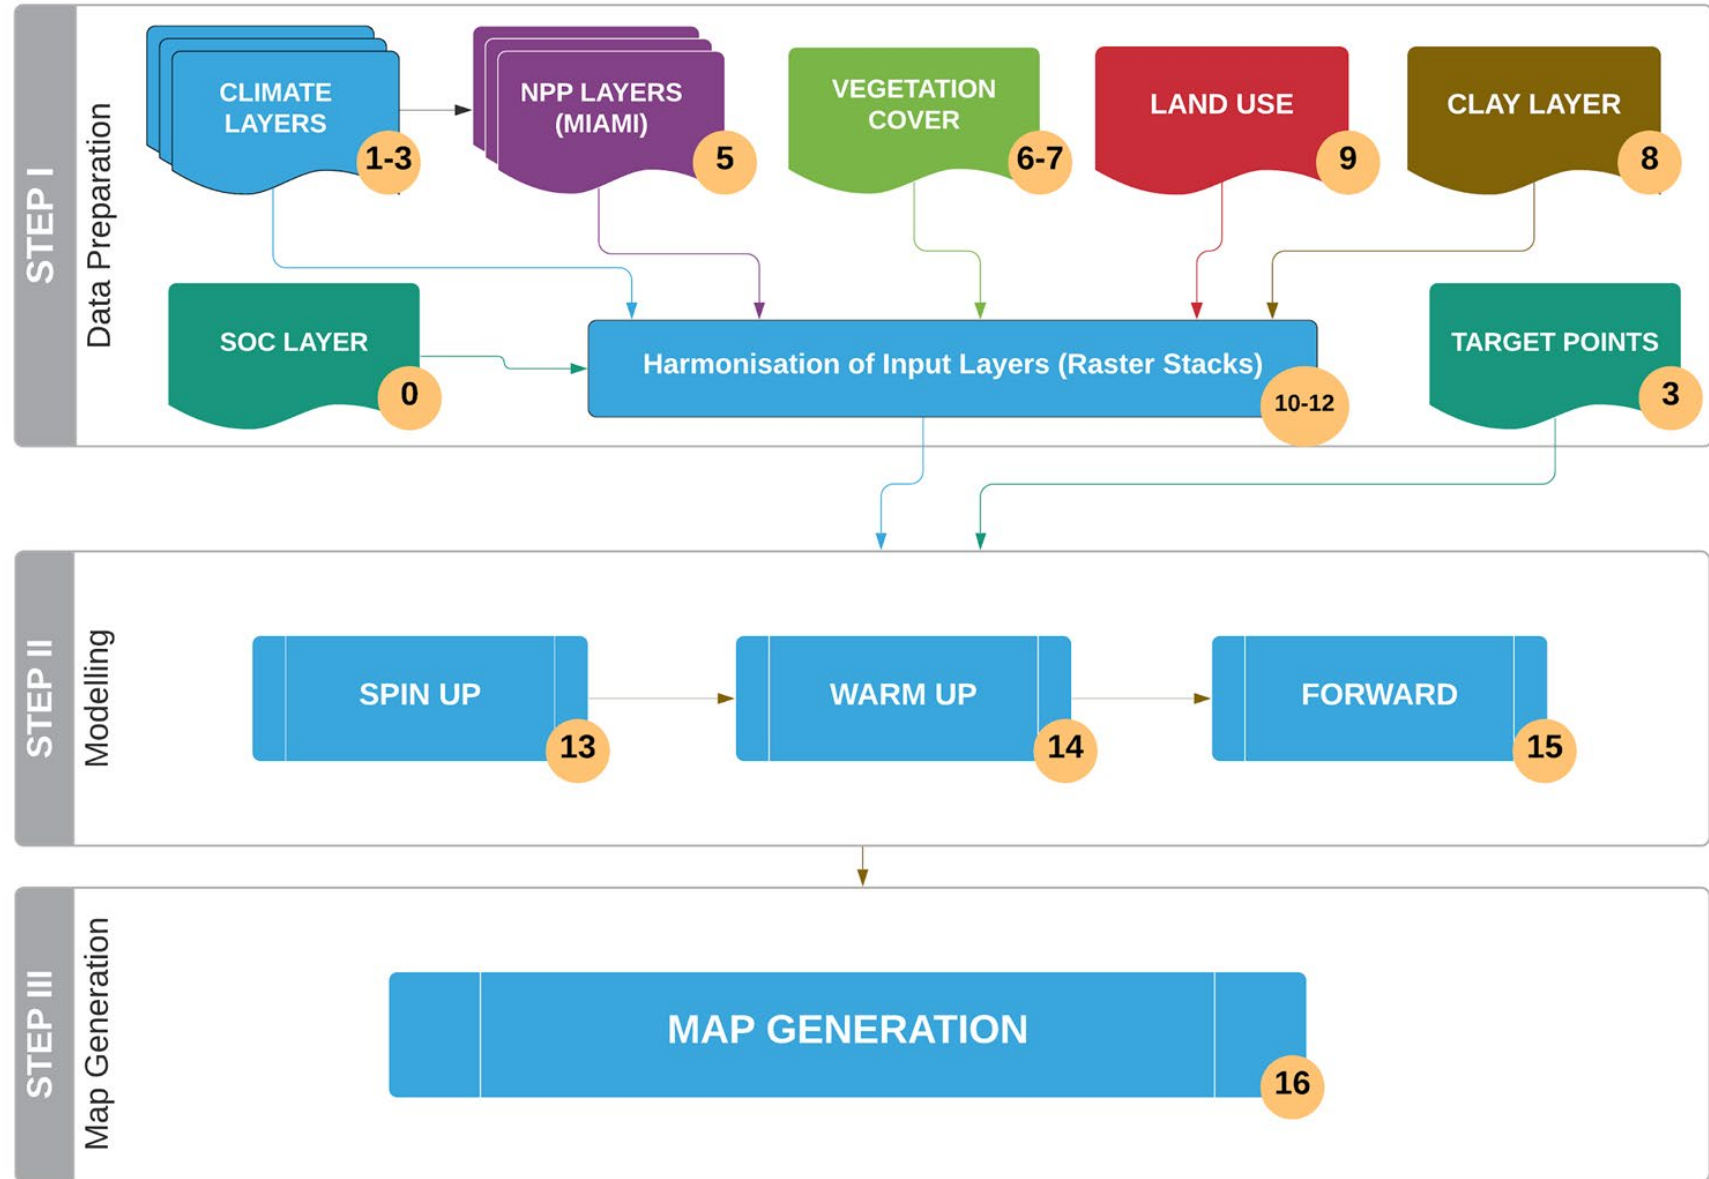

Input data requirements				
Data	Variables	Time series	Units	Type
Climatic data	Monthly air temperature	1980-2000; 2001-2020 (or until last year available)	°C	Raster
	Monthly evapotranspiration (Penman-Monteith)	1980-2000; 2001-2020 (or until last year available)	mm	Raster
	Monthly precipitation + irrigation	1980-2000; 2001-2020 (or until last year available)	mm	Raster
Soil data	Topsoil clay content (0-30 cm)	-	%	Raster
	Current Soil organic carbon stocks (0-30 cm)	Latest version of national FAO-GSOC map	tC ha ⁻¹	Raster
Land use/cover	Predominant land use/cover, re-classified into: Minimum: 4 default classes required by model: agricultural crops, grassland/shrubland/savannas ; forests; others Optimum: 11 classes defined in the FAO Global Land Cover - SHARE (GLC-SHARE)	Minimum: representative 2000-2020 (or last year available) Optimum: annual land use 2000 to 2020	1-11	Raster
	Monthly vegetation cover. Obtained from national statistics/local expert knowledge; or derived from NDVI or spectral indexes (see section 3.3.4)	Minimum: average 2015- 2020 (or last year available period) Optimum: monthly soil cover 2000 to 2020	0-1	Raster

Scripts - Sequence

promoting sustainable soil management for all

scripts

● Script Number

Type of Layer	Script	Objective
SOC layer	0. R- Script number 0	Cut the soc layer by the area of interest polygon
Climate layers	1. R- Script number 1 2. R- Script number 2 3. R- Script number 3	Rearrangement of climate layers (CRU layers from .ncd to .tif)
NPP layers	5. R- Script number 5	Creation of NPP layers
Vegetation Cover (VC)	6. GEE Script number 6 (Google Earth Engine) 7. R- Script number 7	Creation of VC layers
Clay layers	8. R-Script number 8	Obtaining clay contents 0-30 cm from different depths (ISRIC)
Land Use layer	9. R-Script number 9	Re-classification into FAO land cover classes
STACK for SPIN UP	10. R-Script number 10	Stack input data layers for the spin up phase
STACK for WARM UP	11. R-Script number 11	Stack input data layers for the warm up phase
STACK for FORWARD	12. R-Script number 12	Stack input data layers for the forward phase
Target points	13. Qgis model script	Creation of target points
SPIN UP	14. R- Script number 13	Run long spin up phase
WARM UP	15. R- Script number 14	Run warm up phase
FORWARD	16. R- Script number 15	Run forward phase
POINTS TO RASTER	17. R- Script number 16	Rasterize points

promoting sustainable soil management for all

Soc FAO : master layer

0_SOC_MAP_AOI.R

OBJETIVE: CROP SOC MAP BY USING COUNTRY POLYGON OR REGION OF INTERES

UNIT: [tn/ha]

promoting sustainable soil management for all

Harmonization of Climate Layers (CRU)

- 1_CRU_variables_SPIN_UP.R
- 2_CRU_variables_WARM_UP.R
- 3_CRU_variables_for_NPP_MIAMI_MEAN_81-00.R

OBJECTIVE: ARRANGE CLIMATE FILES (CRU FORMAT)
TO BE USED IN THE MODELING PHASES

Units: [mm/month] [°C]

NPP (Net primary production) Layers

 4_MIAMI_MODEL_NPP_MIAMI_MEAN_81-00.R

OBJECTIVE : Estimate annual NPP (using MIAMI Model) for the 1981-2000 period.

Year to year NPP is estimated and then averaged.

Clay

 8_Script_CLAY_from_ISRIC.R

OBJECTIVE: Estimate clay % 0-30 cm depth using weighted average (ISRIC Clay layers)

Unit: %

promoting sustainable soil management for all

LAND USE

 9_Land_Use_ESA_to_FAO_classes.R

OBJECTIVE: RE-CLASSIFY ESA (EUROPEAN SPACE AGENCY) COVER CLASSES TO FAO LAND USE CLASSES.

promoting sustainable soil management for all

SOIL/VEGETATION COVER Layers: GEE-R

 6_Vegetation_Cover_GEE_copy_to_code_Editor.txt

 7_Veg_Cov_stack.R

OBJECTIVE: Generate a stack of 12 layers, one for each month that represents vegetation cover for each pixel.

- We will estimate Google Earth Engine for each pixel, as the number of images with vegetation from total images of a specified time series (assuming NDVI higher > 0.3 threshold)
- We will get a probability from 0 to 1, (being 0 never covered and 1 always covered)
- These values are then re-escalated to the vegetation cover factor (0.6 = covered; 1 = bare soil)

Vegetation cover from Google Earth Engine

MOD13A2 v006
MODIS/Terra
Vegetation
Indices 16-Day
L3 Global 1 km
SIN Grid

365/16 ≈ 22 Layers
per year
22/12 ≈ 2 Layers per
month

Total images = ~2
Layers per month x
years of interest

$$P_{veg} = \frac{\text{Number of images NDVI} > 0.6}{\text{Total images}}$$

HARMONIZATION OF LAYERS (generating Stacks)

- 10_SPIN_UP_STACK_V3.R
- 11_WARM_UP_STACK_V5.R
- 12_FORWARD_STACK.R

OBJECTIVE: GENERATE STACKS OF INPUT DATA LAYERS (USING GSOC FAO 1KM AS A MASTER LAYER) TO BE USED IN EACH MODELING PHASE : SPIN UP- WARM UP – FORWARD.

FOR THE WARM UP PHASE, CLIMATE LAYERS ARE NOT INCLUDED IN THE STACK DOR FILE SIZE RESTRICTIONS (NEAR 700 LAYERS).

CREATING TARGET POINTS

 Qgis_Procedure_number_1.model3

OBJECTIVE : GENERATE TARGET POINTS WHERE THE MODEL IS TO BE RUN

SELECT ONLY LAND USES OF INTERESTS (AVOID WATER BODIES, NATIVE VEGETATION, FORESTS, DESSERT AREAS... WHERE NO MANAGEMENT IS TO BE IMPLEMENTED)

CAN BE MODIFIED DEPENDING ON COUNTRY INTERESTS (Eg. restoration of native vegetation)

Step 2 : Running the model

promoting sustainable soil management for all

Running the Roth C - SoilR

- 13_ROTH_C_SPIN_UP_UNC_v2.R
- 14_ROTH_C_WARM_UP_UNC_v3.R
- 15_ROTH_C_FOWARD_UNC_v3.R

SPIN UP: THE OBJECTIVE IS TO ESTIMATE C INPUT LEVELS TO REACH TFAO GSOCmap SOC STOCKS. ADDITIONALLY, TO ESTIMATE INITIAL SOC STOCKS OF EACH POOL

WARM UP: THE OBJECTIVE IS TO C INPUTS AND SOC STOCKS USING MONTHLY DATA FROM THE LAST 20 YEARS (CLIMATE- NPP - LAND USE (OPTIONAL))

FORWARD: THE OBJECTIVE IS TO PROJECT SOC STOCKS PER PIXEL AND ESTIMATE THE UNCERTAINTY OF THAT PREDICTION

Step 3 : From Points to Rasters

promoting sustainable soil management for all

FROM POINTS TO RASTERS

promoting sustainable soil management for all

From points to rasters

 16_Points_To_Raster.R

OBJECTIVE:

MODELING OUTPUT WILL BE A 'POINT' VECTOR FILE (1 POINT PER PIXEL), WITH INFORMATION ABOUT THE THREE SCENARIOS AND THE BASE SCENARIO (BAU).

IT WILL ALSO CONTAIN INFORMATION ON THE UNCERTAINTY OF THE SIMULATED DATA. THESE VALUES ARE SAVED IN A TABLE ATTACHED TO THOSE POINTS (ESRI SHAPEFILE FORMAT).

THIS LAST STEP WILL TRANSFORM THESE POINTS TO RASTER FILES, ONE FOR EACH TARGET MAP.
